REPORT

OF THE

COMMISSIONER OF EDUCATION

FOR

THE YEAR 1896-97.

VOLUME 1.

CONTAINING PART I.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1898.

THE UNITED STATES

BUREAU OF EDUCATION,

Created as a Department March 2, 1867.

Made an Office of the Interior Department July 1, 1869.

COMMISSIONERS.

HENRY BARNARD, LL. D.,

March 14, 1867, to March 15, 1870.

JOHN EATON, PH. D., LL. D.,

March 16, 1870, to August 5, 1886.

NATHANIEL H. R. DAWSON, L. H. D.,

August 6, 1886, to September 3, 1889.

WILLIAM T. HARRIS, PH. D., LL. D.,

September 12, 1889, to date.

CONTENTS OF VOLUME 1.

THE COMMISSIONER'S INTRODUCTION.

PART I.

CHAPTER I.—EDUCATION IN GREAT BRITAIN AND IRELAND.

CHAPTER II.—EDUCATION IN FRANCE.

CHAPTER III.—EDUCATION IN DENMARK.

CHAPTER IV.—EDUCATION IN NORWAY.

CHAPTER V.—EDUCATION IN CENTRAL EUROPE.

CHAPTER VI.—COMMERCIAL EDUCATION IN EUROPE.

CHAPTER VII.—THE TEACHING OF CIVICS IN SWITZERLAND, FRANCE, AND ENGLAND.

CHAPTER X.—THE CURRICULUM OF THE LAND-GRANT COLLEGES.

CHAPTER XI.—REQUIREMENTS FOR ADMISSION TO FRESHMAN CLASS IN COLLEGES, UNIVERSITIES, AND SCHOOLS OF TECHNOLOGY.

CHAPTER XII.—THE LEGAL RIGHTS OF CHILDREN.

CHAPTER XIII.—PSYCHOLOGICAL TENDENCIES—THE STUDY OF IMITATION.

CHAPTER XIV.—DISCUSSION OF EDUCATIONAL TOPICS, BY PRESIDENT FRANCIS A. WALKER, OF THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY, WITH SOME ACCOUNT OF HIS LIFE.

CHAPTER XV.—HORACE MANN AND THE GREAT REVIVAL OF THE AMERICAN COMMON SCHOOL, 1830-1850.—By A. D. Mayo, LL. D.

CHAPTER XVI.—HENRY BARNARD.—By A. D. Mayo, LL. D.

CHAPTER XVII.—REPORT OF THE COMMITTEE OF TWELVE ON RURAL SCHOOLS.

CHAPTER XVIII.—ENTRANCE REQUIREMENTS FOR ENGINEERING COLLEGES.

CHAPTER XIX.—EARLY HISTORY OF THE KINDERGARTEN IN ST. LOUIS, MO.

CHAPTER XX.—SOME RECENT CONTRIBUTIONS OF BIOLOGY, SOCIOLOGY, AND METALLURGY TO THE CURRICULUM OF COLLEGES ENDOWED BY THE FEDERAL GOVERNMENT FOR THE BENEFIT OF AGRICULTURE AND THE MECHANIC ARTS.

CHAPTER XXI.—THE TENNESSEE CENTENNIAL AND INTERNATIONAL EXPOSITION, HELD IN NASHVILLE, TENN., MAY 1 TO OCTOBER 31, 1897.

CHAPTER XXII.—EDUCATIONAL DIRECTORY.

REPORT OF THE COMMISSIONER OF EDUCATION.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, October 1, 1897.

SIR: I have the honor to submit herewith the annual report of this office for the year ending June 30, 1897:

Total enrollment in schools and colleges.—There were enrolled in the schools and colleges, both public and private, during the school year 1896–97, 16,255,093 pupils, being an increase of 257,896 over the preceding year. Of this total 1,513,016 pupils were in private institutions and 14,742,077 in public institutions. Comparing these figures with those of the previous year it will be seen that the increase of pupils is confined to the public institutions. In fact there appears to have been a slight decrease in the total number attending private institutions, namely, about 1¼ per cent. This is doubtless due to the long continuance of what is called "hard times." When manufacturing and commercial enterprise is checked, capital becomes timid and the surplus of labor which has hitherto been engaged in the two classes of employment represented in the manufacture and exchange of goods is obliged to fall back upon agriculture. The large proportion of the laborers engaged in these two employments has originally come from the farm population, and turning from farming to manufacturing and commerce the population consumes the products of agriculture and creates a better market for the farm, while on the other hand it cheapens the products of manufacture and lessens the cost of the exchange of goods, so that the farmer gains in three ways, first by having fewer farmers to compete with, second by having a market near at hand, and third by having the cost of transportation of all the goods which he receives from a distance or sends to a distance reduced. With these facts in mind it is very easy to understand how a check in commerce and manufactures affects disastrously the wealth of the nation. The shrinking of fortunes and incomes affects the private school.

Besides these pupils enrolled in public and private institutions classed as elementary schools, secondary schools, and higher educational institutions, there are pupils enrolled in various special schools not included in the above figures. These items are as follows:

City evening schools	183,168
Business schools	77,053
Indian schools	22,964
Schools for defective classes	22,624

Reform schools	24,426
Benevolent institutions, chiefly orphan asylums that do not send to the public schools in their vicinities	13,309
Miscellaneous	49,650
Total	393,194

The miscellaneous in the above table includes such institutions as schools of music, oratory, elocution, schools of various arts, such as cooking, etc. This gives 16,648,287 as the grand total.

THE COMMON SCHOOLS.

The expression "common schools" is used in this office to include public schools of elementary (first eight years' course of study) and secondary grades (ninth to twelfth year's course of study), no institutions of higher education being included, although the State universities are supported from public funds. Nearly all of the common schools throughout the United States are supported entirely by public taxation and the proceeds of the school funds. In a few instances these public funds are eked out by small tuition fees paid by the parents.

The first of the following tables gives a condensed summary of the common school statistics compiled from the data furnished this office by the State superintendents. The increase in pupils over last year is 273,414. The table shows the comparative items for nearly three decades. In 27 years the enrollment in the common schools has increased from about seven and one-half millions to fourteen and two-thirds millions. The proportion of the population enrolled in the common schools has also increased from 19 per cent to over 20½ per cent. This fact is to be accounted for by the increase in the growth of cities. An urban population provides more generously for the schooling of its people. But the effect of the urban growth is seen more fully in the increase of the average length of the school term in days. While in 1870 it was 132 days for the entire United States, in 1897 it had increased to 140.4 days, and while there was an average of 49 days for each person of school age (5 to 18 years) in 1870, in 1897 the average had risen to 67 days.

In the second table, showing general financial statistics, it is seen that the public schools, including elementary schools and high schools, received for their support during the year 1896–97 the sum of $188,641,243. This is an increase of a little more than $7,000,000 over the previous year. But it will be seen that while the expenses in 1870 amounted to $1.75 per day, in 1896–97 the amount was $2.62 on the average for each inhabitant, and this for the pupils who actually attended school amounted to $18.57 in the year 1896–97, while it amounted to $15.20 in the year 1870–71. This addition to the cost of tuition is partly due to the increased number of days in which the pupils actually attend school, and partly due to the increased amount paid for salaries of teachers, improved school buildings and apparatus. Each pupil

III.—*Total number of pupils and students of all grades in both public and private schools and colleges, 1896-97.*

NOTE.—The classification of States made use of in the following table is the same as that adopted by the United States census, and is as follows: *North Atlantic Division:* Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania. *South Atlantic Division:* Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. *South Central Division:* Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Oklahoma. *North Central Division:* Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. *Western Division:* Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Washington, Oregon, and California.

Division.	Pupils receiving elementary instruction (primary and grammar grades).		Pupils receiving secondary instruction (high-school grade).*a*		Students receiving higher instruction.								
					In universities and colleges. *c*			In schools of medicine, law, and theology. *e*			In normal schools. *g*		
	Public.	Private (largely estimated).	Public. *b*	Private (in preparatory schools, academies, seminaries, etc.).	Public. *d*	Private.	Total.	Public. *f*	Private.	Total.	Public.	Private. *h*	Total.

a Including pupils in preparatory or academic departments of higher institutions, public and private, and excluding elementary pupils, who are classed in columns 2 and 3. A classification of public and of private secondary students, according to the character of the institutions in which they are found, is given in Chap. XL, Vol. 2.

b This is made up from the returns of individual high schools to the Bureau, and is somewhat too small, as there are many secondary pupils outside the completely organized high schools whom there are no means of enumerating.

c Including colleges for women, agricultural and mechanical (land-grant) colleges, and scientific schools. Students in law, theological, and medical departments are excluded, being tabulated in columns 9-11. Students in academic and preparatory departments are also excluded, being tabulated in columns 4 and 5.

d Mainly State universities and agricultural and mechanical colleges.

e Including schools of dentistry, pharmacy, and veterinary medicine.

f Mainly in schools or departments of medicine and law attached to State universities.

g Nonprofessional pupils in normal schools are included in columns 4 and 5.

h Private normal schools are, with few exceptions, scarcely superior to the ordinary secondary schools.

i There are, in addition to this number, 22,554 students taking normal courses in universities, colleges, and public and private high schools. (See Chap. XXXIX, Vol. 2.)

IV.—Total number of pupils and students of all grades in both public and private schools, 1896–97—Continued.

CITY SCHOOL SYSTEMS.

As shown above, the enrollment in the State common schools for 1896–97 was 14,652,492. This includes the enrollment in the public schools of the 578 cities of 8,000 population and over. In these cities the number of pupils enrolled was 3,590,875, or 24.50 per cent of the common-school enrollment for the United States. There was an increase of 106,620, or 3.06 per cent, in the enrollment in the public schools of cities in 1896–97 over the previous year, while there was a decrease of 24,151, or 2.85 per cent, in the estimated enrollment in private and parochial schools. The enrollment in these private schools in cities, as reported to the office by city superintendents, was 824,609.

The average daily attendance in the city public schools was 2,687,758, an increase of about 5 per cent over the preceding year. The number of supervising officers in the city systems was 3,859 and the number of teachers 74,117, an increase of 5.39 per cent in the number of teachers. The number of buildings used for school purposes was 8,604, while the number of sittings was 3,397,275, an increase of less than 1 per cent over the previous year. The expenditure for teaching and supervision aggregated $48,772,485, an increase of 4.33 per cent, while the total expenditure was $84,866,092, an increase of $4,823,974, or 6.03 per cent, over the amount expended in 1895–96.

The urban population in 1870 was almost 21 per cent of the whole, but in 1890 it had risen to nearly 30 per cent.

AVERAGE AMOUNT OF SCHOOLING PER INHABITANT.

In reply to the question, How much schooling is each inhabitant receiving on the basis of the present attendance? I drew up two tables some years ago which I have reprinted with additions from time to time. If the conditions existing in the year 1896–97 were continued indefinitely, what would be the average amount of schooling per individual, counting it in school years of two hundred days each? I find that if we include public and private schools and higher education as well as elementary and secondary, the amount that each inhabitant would receive is 4.94 years. Table V shows that the divisions of the United States differ very much, the lowest average being 2.83 years, and the highest average being 6.50 years. The results are shown in comparative form beginning with 1870. In Table VI the average amount of schooling in the public schools alone is shown, omitting the private schools.

V.—*Average total amount of schooling (including all grades of both public and private schools) each individual of the population would receive under the conditions actually existing at the different dates given below.*

Education in Great Britain and Ireland.—The statistics of education in Great Britain presented in Chapter I show a vast development of the system of elementary schools. Since the passage of the education law of 1870, which applied to England and Wales, the school enrollment in this division of the Kingdom has increased by 226 per cent, while the increase in population has been only 39 per cent. The improved condition of the schools is illustrated by the relative increase in average attendance; in 1874 it was 67 per cent of the enrollment; in 1896 it had risen to 81 per cent. The change in the composition of the teaching force is an additional sign of improvement. Pupil teachers, who formed the majority of the teaching force in 1874, were but 29 per cent of the total in 1896.

In Scotland, whose schools are administered under the law of 1872, there was much less room for improvement, as education had long been a general interest. In that country, however, the law, by giving formal organization and Government support to the work, facilitated its growth. The statistical survey of Scotland carried back over a period of sixteen years shows an increase of 33 per cent in enrollment as against an increase of 13 per cent in the population. The average attendance, which in 1880 was 78 per cent of the enrollment, had risen in 1896 to 81 per cent. The decrease in the number of pupil teachers during the same time has also been marked. From 44 per cent of the total in 1880 they fell to 26 per cent in 1896.

The withdrawal of the English education bill of 1896, whose scope

and fate were considered in my previous report, proved to be final, and no further attempt has been made to reorganize the system as a whole. A new bill for the relief of voluntary schools (private schools, chiefly denominational) was presented upon the reassembling of Parliament in 1897 and was passed. It places an additional grant from the public treasury, amounting for the current year to $3,000,000, at the disposal of parochial schools without any provision for public control, and also relieves their property from taxation. The bill was opposed by the Liberals and regarded with disfavor by many Conservatives as establishing a dangerous precedent with respect to the application of public money, and further, as introducing the principle of special legislation into the school system. Immediately a second bill was introduced and passed for the relief of board schools in poor districts. It proposed an appropriation ($553,000) for this object, and is chiefly noteworthy as continuing the policy of special legislation.

The law for the relief of parochial schools provides for the federation of schools and the allotment of the due proportion of the relief grant to the governing body of the federation. The provision, it was felt, would greatly increase the ecclesiastical influence in school matters, and such appears to be its outcome.

The text of the law, the grounds on which it is supported, and the opposition it has excited are considered fully in Chapter I. Its bearing is shown more clearly by a review of the successive laws and official regulations by which the present system has been developed. On the whole, it would appear that the recent legislation has increased rather than allayed the causes of friction in the school system.

The survey of elementary education in London which completes the chapter gives emphasis to the action of local authority in the English system. The London school board has vast powers as well as onerous duties. It deals with a population of 4,500,000. In 1870 the only school accommodation was in parochial and other private schools and sufficed for about half the school population. The London board, created under the law of 1870, had not only to make up the deficiency, but to keep pace with the ever-growing child population, which has increased by 45 per cent since that date. This task has been accomplished. In London, as in most of the English cities, the board schools have outstripped the parochial in number and efficiency, providing for 66 per cent of the school population as against a ratio of 48 per cent for the board schools of the country at large. Certain of the private elementary schools, however, rank very high and offer important suggestions as to the means of meeting the wants of the poorest class. This is particularly true of the Jews' free school. In all the board schools, tuition, school books, and other appliances are free. The expenditure amounted to $11,700,000 in 1896, or a gross cost per capita of average attendance of $19.54. The rate, which is regarded as enormous by critics of the schools, is below the average

per capita in cities of the United States. The return of a progressive board at the late election assures the continuance of a generous policy.

The provision for dealing with truant children and the development of evening schools are important features of the policy of the board.

In the provision of higher-grade board schools London has done less than Manchester, Sheffield, and several other cities. There are, however, many private and corporate agencies in the metropolis engaged in providing secondary and technical instruction for the people. Their nature and work are briefly treated in the chapter considered.

Education in France.—The principal event in the current history of education in France presented in Chapter II is the transformation of the State faculties into autonomous universities by a law of 1896. The law is the culmination of a series of measures dating back to 1885. The universities are not thereby freed entirely from the control of the Government. This is still maintained in respect to the appointment of professors and the requirements for degrees, which are in fact State titles, carrying professional and official privileges. Nor are the universities deprived of State appropriations, from which in fact their income is chiefly derived. The university councils will, however, have control of the fees, excepting those incurred in respect to degrees, of the university property and the adjustment of the internal affairs. It is certain that local effort will be greatly stimulated by the new relations.

The universities that have their seats in the great centers of commerce and industry naturally enter upon the new order with great confidence; for the smaller universities, the hope is expressed that they will specialize according to the wants or interests of the region—technical, historical, or philological, as the case may be—and thus become strong by force of important specialties.

The increase of attendance in church schools of "secondary" grade excites interest in view of the fact that the enrollment in the State lycées and local public colleges has remained stationary for several years. The "secondary" schools include lycées and communal colleges and correspond, not to our high schools, but to the gymnasia of Germany. Their course covers two years of our college work. They are the schools of liberal culture and their graduates exercise an immense influence, hence the State desires to maintain its ascendancy in this department. It appears that, while in respect to attendance the status of the national schools is not entirely satisfactory, they contribute a much larger proportion of students to the special schools of high order than the rival institutions. This is an important matter, as the graduates of the special schools enter into the most influential posts in the public service.

The law of 1893 respecting the salaries of primary teachers, which

went into effect the present year, improves somewhat the average condition of the teachers.

The superior primary schools of France, corresponding to high schools in this country, have had remarkable growth under the combined efforts of the Government and local authorities, and offer very important lessons in the organization and varying adaptations of schools of this class. Their scope and work are set forth very fully in this chapter. The continued and successful efforts for adult education are also noted. A paper translated from M. Boutmy on the reform of the baccalaureate, and the address of M. Bréal before the "Association for the Encouragement of Greek Studies" on the genius of the Greek language, complete the survey of education in France.

Education in Norway and Denmark.—The general trend of education in Norway and Denmark, as well as in Sweden, is toward the adoption of urban improvements in the schools. Villages are growing into cities, and new villages are beginning in the rural sections. The ambulatory school (in which the teacher taught from house to house), formerly a necessity in the thinly settled regions of these countries, is being replaced by the village and city school, with its centralization of effort.

The youth of the rural section gravitates to the city, where he can find better advantages not only in the school, but in the shop of the manufacturer or the merchant. For new inventions in the way of machinery are making it possible to produce the raw material of food and clothing by means of fewer laborers; hence the rural regions, where the raw material is produced, are relatively decreasing in population, the surplus of laborers set free by machinery removing to villages and engaging in manufactures, commerce, and transportation. Fewer people being needed for the production of raw material, more people are available for finishing goods and for the production of articles of luxury and creature comfort. More people are available, too, for the higher occupations, that deal with the protection of man and provide for his culture. The census from decade to decade shows in civilized countries an increase of people engaged in the collection and diffusion of information; engaged in scientific discovery, in the work of teaching, and in benevolent and religious enterprises. The protective employments, including first those engaged for the protection of the health of the community, increase, and we have more physicians, more experts in various kinds of diseases, and more persons engaged in the scientific investigation of the causes and prevention of pestilent epidemics, and also chronic diseases that arise from malaria; more persons are engaged in the protection of property, not only the class of lawyers, but insurance agents of many kinds. It is the most comforting reflection that comes to us in this age of progress, namely, that nature is being subdued for the uses of man and man himself stimulated to fit himself for a higher range of employ-

ments than those which deal with the collecting of raw material and the first rude appliances of manufacturing. The financial statistics of civilized countries show a rapid increase in productive power. While some, mostly rural countries, such as Russia, Austria, and Italy, produce from 11 to 20 cents a day for each inhabitant, countries in which the urban industries are very prominent, as in France, Belgium, England, and the United States, produce from 40 to 50 cents a day for each inhabitant. Hence it happens that in England three families out of ten receive an annual income of $1,000 and upwards. The population of France does equally well; and, as in Great Britain and France productive industry finds its highest realization, articles of human comfort, protection, and culture are cheapest there and within the means of the laboring classes.

In the Scandinavian countries the influence of this struggle to conquer nature by machinery and elevate the employments of men is beginning to be felt. Denmark leads and Sweden follows. Norway follows at a greater distance, but with an assured progress. The educational statistics from year to year from these countries prove that more attention is paid to the development of mechanical skill among the people. At first the sloyd and other industrial schools did not show the marked influence of æsthetic studies. Later, however, the examples of France and Belgium have had their influence, and more attention is being paid to the cultivation of taste as the chief factor in enhancing the value of productions.

In Chapters III and IV of this report many details are given showing the progress in those countries in the establishment of manual training and in the coeducation of men and women in the universities; the improved facilities for the professional education of teachers; the increase of pupils in the technical studies and in modern languages, and in general the larger appropriations for the support of schools.

Education in central Europe.—Chapter V of the report contains a translation of Mr. H. Scherer's review of educational currents of thought in Europe in 1895. His article indicates the increased attention that is paid to psychology, and more especially to sociology. Up to within a few years the principle of individualism as enounced by Rousseau prevailed, and the social whole was considered an accident of human nature rather than its substance. It is likely that the reaction which is now bringing more and more theoretical emphasis upon social organization will go too far, and that it will lay too much stress upon the institutional life of the human being, but this danger does not threaten us at present. There is so much ground to be covered before the dangerous individualism of Rousseau is corrected that we are not likely to see the triumph of the principles of socialism and communism in the present generation. Mr. Scherer has well indicated the importance of studying education from the standpoint of the civilization of the time. What Germans call Kultur-Geschichte

is the basis of intelligent study of all institutions of society, and especially of the system of education. One of the first fruits of this study of education from the standpoint of social science is the attention given to the weaklings in society, whether the weaklings in intellect, or in thrift, or in morals. The paupers, criminals, and insane are recruited from these classes. Statesmanship now gives more attention to the causes of crime and to its cure, while formerly it paid attention only to its punishment. Special schools for children of limited mental capacity is the second topic in the fifth chapter. It discusses a report based upon statistics published by the Prussian minister of education, which offers a comparison between the condition of these schools in 1892 and their condition in 1896. It is now seen clearly that there should be a medical examination of school children in all schools, and that the diagnosis of the child should in many cases furnish hints for the school programme to which he is assigned. The increase of secondary schools in Prussia is noteworthy, but still more noteworthy is the instruction now given in Germany with reference to the trades and arts. Germany, before all other nations, strives to govern its national housekeeping by the systematic results of intelligence. The Government, for instance, discovers that its people do not consume as much sugar per inhabitant as more favored commercial countries, such as England and France, and yet, having a northern climate, it should have the benefit of the more carbon which the sugar furnishes. It finds that the world is depending on the inhabitants of the tropics for the production of this article. Why should not some method be adopted by which people in the temperate zone, people living in Saxony and Prussia, for example, can produce their own sugar? A commission appointed on this subject discovers that the most available plant for this purpose is the beet. The Government at once stimulates beet-root raising by offering bounties on the sugar that is exported from the country. To the astonishment of the world, in a few years the beet-root sugar of the world exceeds the cane sugar in the ratio of 9 to 7; 4,500,000 tons of beet-root sugar, 3,500,000 tons of cane sugar. The old motto, "Perseverance conquers all things," shall read, "Rational insight conquers all things." Again, Germany sees that its own national quota from productive industry is not much more than one-half as much per inhabitant as the production of Great Britain and France. To be the strongest nation it is requisite to be the richest nation. The production of raw material in great amounts does not suffice to make a rich people. The greatest agricultural countries, namely, southern Russia, the South American States, the prairies of the Mississippi Valley, do not produce wealth like the cities of England and France and the Atlantic coast of the United States. Nor are the countries which have only manufactures besides agriculture the richest peoples; it is also requisite to have a certain quota of the people engaged in commerce. Since

1875 Germany has been the theater of the most wonderful transformation in this matter of manufactures and commerce that the world has ever seen. Its progress is felt by all rival nations. It would seem that Germany is the pedagogic nation, the educator of the world, not only in schools, but in the organization of armies, the conduct of wars, also in the development of manufactures, the division of labor among its people, and in the building up of a commerce. Other nations finding out what Germany is doing will adopt the same methods, and a progress initiated throughout the civilized world will produce rapid changes for the better. At the rates of progress going on during the thirty years from 1850 to 1880 the United States might produce a dollar a day for each man, woman, and child by Anno Domini 1950, but the progress in the decade from 1880 to 1890 was much more rapid than this. The tendency of the introduction of machinery to aid the hand laborer is to increase by the geometrical ratio rather than arithmetical ratio.

In the fifth chapter, also, there is a discussion relating to the proportion of Catholics, Protestants, and Jews in the secondary schools of Germany. The data are given and interesting deductions drawn by Professor Von Mayr. The American teacher will be greatly interested to read the judicious remarks of Dr. Ernst Schlee on the recent movements of education in the United States; also the views of Dr. Otto W. Beyer on the report of the English Royal Commission on secondary education.

Commercial education.—In Chapter VI a brief but comprehensive statement of what is done for commercial education in a large number of European countries is given. The German movement, already alluded to, has probably stimulated the effort which is going on in many countries in the way of improving the quality of commercial education. These schools not only teach penmanship, bookkeeping and arithmetic, typewriting, telegraphy, and banking, but they take up commercial law, and the manners and customs of foreign commercial agencies, the method of preparing goods for foreign markets, the history and social status of foreign countries. In the report of this Bureau for 1895–96 a remarkable article on commercial schools in Europe, prepared by Prof. E. J. James for the American Bankers' Association, is given in Chapter XV, pp. 721–837. That report shows how the students of the commercial school are set to work studying the raw materials of industry in a comparative manner, learning the good and bad features of those productions in each quarter of the world, learning how they are produced and prepared for market. Further studies are prescribed in which the entire process of manufacture is entered upon, and also the method of preparing for market, transportation, and final distribution to the consumer. Such schools as these produce commercial directive power. It must be admitted, however, that the methods which the Germans have originated and

put into application have not yet been intelligently reported upon for the benefit of foreign nations.

The study of civics.—In Chapter VII an account of the methods adopted in Switzerland and France to teach the youth of those two Republics the duties of citizenship is given. It seems that while the Swiss reserve this study for pupils of supplementary or continuation schools—that is to say, pupils in the seventh to the fourteenth years of the course of study—on the other hand the French attempt to introduce this material as a regular study into the elementary schools. The great fertility of the French mind in inventing devices for instruction appears in the text-books and programmes of this course of civic study. Above all peoples the French understand how to make things talk. They can make objects instruct the youth automatically. They know best how to reduce the material of education to what I have called a "pedagogic form." Having settled upon the subject-matter which the pupil should learn, it is necessary to arrange this in such an order that the simplest comes first and that the earlier steps assist in the mastery of the later steps. It is very important, too, in obtaining the pedagogical form to insist on the arrangement of the matter in such a way that the first steps are valuable in and for themselves if not followed by any later steps. It is a badly arranged course of study if some branches derive their entire usefulness from what is to succeed them. For the pupil in this case wastes all his time spent on these branches if he leaves school before arriving at the later steps which give value to the early steps. The teaching of mathematics and language has been so long in the course of development that its branches in the course of study have attained a nearly perfect pedagogical form. This is not yet the case in natural science and still less is it the case in the branches of industrial training. But the wise teacher will do well to study carefully the methods adopted in the French schools in order to find the best yet attained in pedagogical form.

Education in Greece.—In Chapter VIII a valuable paper is submitted on education in Greece. A brief sketch is given of the civilization of the Greeks, particularly of the Ionian branch. Greece continues to be of interest to the world because of the fact that it has furnished one of the three great contributions to civilization. The scientific turn of mind and the forms of art and literature all come from Greece, while the forms of law which enumerate the rights of person and property come from Rome. The view of the world which forms the deepest and most influential element in our civilization comes from Judea. The study of Greek art and literature looks for its illustrations to the ancient Grecian home in the present age even more than it has done in preceding centuries. One investigator, Schliemann, has wrought a considerable change in the method of classic study. The results of archæology, as pursued in Germany from the time of Winckelmann to the present, have wrought as great

a change in another part of classical study. The modern Greek, whether a lineal descendant or a descendant by adoption from the ancient Greek, can not choose but share in the warm interest of all western peoples who participate in the heritage of culture which comes to them from ancient Greece.

Sunday schools.—In Chapter IX is to be found an elaborate article on the subject of the Sunday school. While the education of the American people supported by taxes and public funds is becoming more and more rigidly secular in character and the lines drawn more closely which separate it from ecclesiastical and religious instruction, yet the true importance of religious instruction is coming to be better understood among scientific and philosophical thinkers. The secular institutions of man are organized as the family, civil society and the state. These provide for education, the procurement of the necessities of life, and the establishment of justice. But all of these presuppose a deeper ground in the ideal of the origin and destiny of man and nature. They involve a world view, and religion furnishes and must furnish a world view. Hence all people, whether connected with one or another denomination of Christians, or whether holding a religion other than Christian or holding no conscious religion at all, must admit the importance of the religious instruction of the community. More than anything else the Sunday school has contributed to the sustenance of the church.

With the spectacle of the systematic organization of the secular schools and the improvement of methods of teaching before them, the leaders in the church have endeavored to perfect the methods of the religious instruction of youth. They have met the following dangers which lay in their path, namely: First, the danger of adopting methods of instruction in religion which were fit and proper only for secular instruction; secondly, the selection of religious matter for the course of study which did not lead in a most direct manner toward vital religion, although it would readily take on a pedagogic form.

The secular school gives positive instruction. It teaches mathematics, natural science, history, and language. Knowledge of the facts can be precise and accurate, and a similar knowledge of the principles can be arrived at. The self-activity of the pupil is before all things demanded by the teacher of the secular school. The pupil must not take things on authority, but must test and verify what he has been told by his own activity. He must trace out the mathematical demonstrations and see their necessity. He must learn the method of investigating facts in the several provinces of science and history. The spirit of the secular school therefore comes to be an enlightening one, although not of the highest order. But its enlightenment tends to make trust in authority more and more difficult for the young mind.

On the other hand religion, which gives the net result of the wisdom

of the race in the form of authority, omits and must omit the long lines of proof which have established it. The experience of thousands of years shrinks to a mere point, and is stated in the dogmas which seem to be immediate spiritual facts resting on external authority, the substructures of thousands of years being almost entirely concealed. Not only are these long periods of experience kept out of sight, but also the vast labors of religious thinkers who have grappled with psychology and philosophy and assisted in making the religious results systematic and without contradiction. Religious education, it is obvious, in giving the highest results of thought and life to the young, must cling to the form of authority, and not attempt to borrow the methods of mathematics, science, and history from the secular school. Such borrowing will result only in giving the young people an overweening confidence in the finality of their own immature judgments. They will become conceited and shallow-minded. It is well that the child should trust his own intellect in dealing with the multiplication table and the rule of three. It is well that he should learn the rules and all the exceptions in Latin syntax and verify them in the classic authors, but he must not be permitted to summon before him the dogmas of religion and form pert conclusions regarding their rationality.

Against this danger of sapping or undermining all authority in religion by the introduction of the methods of the secular school which lay all stress on the self-activity of the child, the Sunday school has not been sufficiently protected in the more recent years of its history. Large numbers of religious teachers, most intelligent and zealous in their piety, seek a more and more perfect adoption of the secular school methods.

On the other hand, the topics of religious instruction have been determined largely by the necessities of the secular school method. That method is not adapted to teach mystic truth. It seeks everywhere definite and especially mathematical results. But these results, although they are found everywhere in science and mathematics, are the farthest possible from being like the subject-matter of religion. Hence it has happened that in improving the methods of the Sunday school greater and greater attention has been paid to the history and geography of the Old Testament and less and less to the doctrinal matters of the New Testament. In Chapter IX the specialist has brought together a great amount of material relating to the statistics of the Sunday schools and also to the methods of instruction. The statistics given, although not of the precise character which can be obtained regarding secular instruction, are yet nearly enough accurate for all purposes.

Land-grant colleges.—Chapter X is practically a symposium upon the important question, "What shall the land-grant colleges teach?" In November, 1894, a committee of the Association of American

Agricultural Colleges and Experiment Stations reported upon the preparation such colleges should demand from applicants for admission. The committee, while urging the necessity of establishing a standard that each college should maintain in order to protect the value of the degrees the land-grant colleges confer, recognized that some colleges are not in a position to do more than make a beginning toward attaining to the standard which the committee deemed desirable should be eventually established. The papers by Presidents Stubbs, White, and Murkland, and by Director Jordan form an interesting and valuable discussion of the matters which should be taught in the land-grant colleges, and the pedagogical spirit which should animate those who are conducting them.

Colleges and universities—Entrance examinations.—The requirements for admission to the freshman class of the various courses of study in 475 universities, colleges, and schools of technology are given in Chapter XI. An examination of the requirements of the several institutions and of the summarized statements preceding the detailed table will show that there is at present a great diversity in such requirements, ranging from a knowledge of reading, writing, spelling, arithmetic, geography, and history up to the requirements demanded by Harvard University. Various organizations throughout the country are at present engaged in a movement for the adoption of uniform entrance requirements. Short accounts of some of these organizations and what has been accomplished by them in this direction are also given in this chapter. Attention is especially directed to the work of the Commission of Colleges in New England on Admission Examinations, which has been engaged on this subject since 1886.

The right of the State to educate.—In Chapter XII will be found a number of decisions by the higher courts of the several States confirming the right of society to educate the citizens of the next generation. It would appear that the courts of law have maintained that it is the right and duty of the legislature to care for the public intelligence as well as for the public health and security, and have further regarded it as a constitutional requirement to refuse to recognize any efforts which tend to establishing two or more antagonistic societies within the same State.

Educational psychology.—Chapter XIII continues the survey of psychological movements maintained in previous reports. The subject is considered in its relation to education and especially as fostered in this country by school officials and teachers.

Under the impulse imparted by Professor Royce, of Harvard, and Professor Baldwin, of Princeton, imitation has occupied the attention of many groups of investigators. A summary of opinions and of data relating to this topic is presented in the chapter followed by a report on the "Imitative functions in childhood as related to the process of learning" from the committee on psychological inquiry of

the National Council of Education. Citations from a preliminary report on the subject by Professor Royce, and extracts from a paper by Mr. E. H. Russell, principal of the Worcester Normal School, setting forth the methods, aims and spirit of observations on childhood as conducted in that institution, complete the chapter.

Gen. Francis A. Walker.—The educational profession in the United States has lost one of its most distinguished members in the person of Gen. Francis A. Walker. His public services to the nation as soldier and as head of the Federal Census Bureau, his labors in the International Statistical Society, over which he presided at its meeting in Chicago in 1893, his many writings upon those topics in education that deal with its pathology—these labors had made him known throughout the world of science and education. To the pathology of education he had contributed most thoughtful suggestions regarding the influence of manual training, and studies upon the methods of curing arrested development in peculiar cases of backward pupils, or pupils who had gained the reputation for dullness or obtusity in mind. Extracts from some of these papers giving his point of view as to the relation of manual training to certain mental defects, the place of college athletics, the extension of technical training, are found at the close of Chapter XIV.

It is hoped that these and other similar papers of General Walker will be collected in a volume by themselves, inasmuch as such a volume would take its place at once in the most select list of educational classics.

Report of the Committee of Twelve on rural schools.—During the past five years three remarkable committees have been appointed through the agency of the National Educational Association and a considerable sum of money placed at the disposal of each to conduct investigations and provide for conference meetings of the committee. First, there was the Report of the Committee of Ten, under the chairmanship of President Eliot, of Harvard College, which discussed the question of the course of study in preparatory schools, laying down certain programmes for secondary schools engaged in the work of fitting students for the college or the school of technology. This report was enriched by the contributions from nine subcommittees, representing the labors of ninety experts. The second national committee, known by the name of the Committee of Fifteen, discussed methods of organization and supervision of city school systems, the normal school preparation of teachers for the elementary schools, and the course of study at present existing in the elementary schools, together with suggestions for its modification.

The third national committee, called the Committee of Twelve on Rural Schools, published the results of its two years' labors in June, 1897. To this report there were nineteen valuable appendices. The entire report without appendices is to be found in Chapter XVII. (These reports can be obtained for small prices from the secretary of

the National Educational Association, Prof. Irwin Shepard, Winona, Minn.)

Engineering schools, entrance examinations to engineering colleges.—In Chapter XI the entrance examinations to the academic departments of the several colleges and universities of the United States are given. In Chapter XVIII are found the entrance requirements to engineering colleges.

Early history of the kindergarten in St. Louis, Mo.—Chapter XIX contains a reprint from the Annual Report of the St. Louis Public Schools, 1878–79, of a discussion of the philosophy of the kindergarten, and also a history of the adoption and growth of the kindergarten system in that city, together with quotations from the lectures of Miss Susan E. Blow on "The gifts and occupations of Froebel."

Contributions to the curriculum of the land-grant colleges.—The remarkable discoveries in biology which have characterized the last half of this century have completely revolutionized the ideas concerning vegetable nutrition and instinct. In Chapter XX certain facts which illustrate the discussions in the higher classes of colleges of agriculture are collated, especially with the view of showing the source of fertility in agricultural work and the economic value of coöperation in agricultural communities. The chapter also contains much data regarding the progress recently made in metallurgy and in mining operations.

Tennessee Centennial Exposition.—The agent in charge of the exhibit of the Bureau of Education at the Tennessee Centennial Exposition, held at Nashville in the summer of 1897, makes a report on the Exposition, and, in view of the educational importance of the Exposition, and especially of one of its features, the reproduction of the Parthenon[1] of the Acropolis at Athens, in the full dimensions of the original, devotes considerable space to the history and significance of this work of art. At present more and more attention is being given in the schools of civilized peoples to the training of pupils in æsthetic taste. Those nations, other things being equal, are the richest that give their goods a beautiful finish and that introduce tasteful ornamentation. This accounts largely for the first rank held by France and Great Britain in the markets of the world.

Nothing else has been found so important in training the taste of youth as a study of the motives and composition of the Greek works of art. Greek art has made the presentation of gracefulness its chief aim. Gracefulness is the summit of the beautiful. Romantic or Christian art is rather a transition from art to a higher province, namely, that of religion, but its products are for this reason less eminent as works of art.

The Greek religion made beauty the essential feature of the idea of

[1] The fine model of the Parthenon, made by Chipiez for the Metropolitan Museum of New York Central Park, has been copied by Mr. Prang for schools, and his reproduction ought to be in every schoolroom.

the divine, and hence the art of Greece is intended as an act of worship of the beautiful. It represents the supreme attainment of the world in pure beauty, because it is pure beauty and nothing beyond. Christianity reaches beyond beauty to holiness. Other heathen religions fall short of the Greek ideal and lack an essential element which the Greek religion possessed. The Greeks believed that the divine is at the same time human, and human not in the sense that the essence of man, his purified intellect and will, is divine, but human in the corporeal sense. The gods of Olympus possess appetites and passions like men; they have bodies and live in a special place. They form a society or large patriarchal family. The manifestation of the divine is celestial beauty. Moreover, the human being may by becoming beautiful become divine. Hence the Greek religion centers about gymnastic games. These are the Olympian, the Isthmian, the Nemean, and the Pythian games. Exercises that shall give the soul sovereignty over the body and develop it into beauty are religious in this sense. Every village had its games for physical development. These were attended by the people, who became in time judges of perfection in human form, just as a community that attends frequent horse races produces men that know critically the good points of a horse. It was known who was the best man at wrestling, boxing, throwing the discus, the spear, or javelin; at running, at leaping, or at the chariot or horseback races. Then at less frequent intervals there was the contest at games between neighboring villages. The successful hero carried off the crown of wild olive branches. Nearly every year there was a great national assembly of Greeks, and a contest open to all. The Olympian festival at Olympia and the Isthmian festival near Corinth were held the same summer; then at Argolis, in the winter of the second year afterwards, was the Nemean festival; then the Pythian festival near Delphi, and a second Isthmian festival occurred in the spring of the third year; and again there was a second Nemean festival in the summer of the fourth year of the Olympiad. The entire people, composed of independent states, united by ties of religion, assembled to celebrate this faith in the beautiful and honor their successful youth. The results carried the national taste for the beautiful as seen in the human body to the highest degree.

The next step after the development of the personal work of art in the shape of beautiful youth, by means of the national games and the cultivation of the taste of the entire people through the spectacle of these games, was the art of sculpture, by which these forms of beauty, realized in the athletes and existing in the minds of the people as ideals of correct taste, were fixed in stone and set up in the temples for worship. Thus Greek art was born. The statues at first were of gods and demigods exclusively. Those which have come down to us cause our unbounded astonishment at their perfection of

form. It is not their resemblance to living bodies, not their anatomical exactness, that interests us, not their so-called "truth to nature," but their gracefulness and serenity—their "classic repose." Whether the statues represent gods and heroes in action or in sitting and reclining postures, there is this "repose," which means indwelling vital activity, and not mere rest as opposed to movement. In the greatest activity there is considerate purpose and perfect self-control manifested. The repose is of the soul, and not a physical repose. Even sitting and reclining figures—for example, the Theseus from the Parthenon, the torso of the Belvedere—are filled with activity, so that the repose is one of voluntary self-restraint and not the repose of the absence of vital energy. They are gracefulness itself.

The bearing of exhibits of Greek art on American industrial education is obvious.

One will concede at the start that tool work is valuable as industrial training, and that especially is this the case with the course of study and work in the manual-training school, because it teaches how to manufacture tools and machines of all kinds, and thereby gives the laborer that command over the instruments of industry which assists him very much in his struggle for excellence in the fields of labor.

Still more valuable must we regard the study of natural science, and especially of applied mathematics, in the laws of matter and motion. It furnishes the theory of all machinery and of all production of supplies from nature.

Besides this, we may claim that general education is of the utmost importance, opening as it does the powers of thought and observation, giving each laborer an insight into human nature and fitting him for logical thinking on all subjects; fitting him alike to lead others and combine them in extensive undertakings, and likewise to serve faithfully and intelligently other leaders when the case requires. This general education is indeed indispensable to the citizen and to the best quality of industrial laborers.

But æsthetic education—the cultivation of taste, the acquirement of knowledge on the subject of the origin of the idea of beauty (both its historic origin and the philosophical account of its source in human nature), the practice of producing the outlines of the beautiful by the arts of drawing, painting, and modeling, the criticism of works of art with a view to discover readily the causes of failure or of success in æsthetic effects—all these things, we must claim, form the true foundation of the highest success in the industries of any modern nation. The dynamic side is needed; but invention of the useful does not succeed in controlling the markets of the world. A nation with its laborers all educated in their taste for beautiful forms will give graceful shapes to their productions, and command higher prices for them. The graceful shape and the proper ornamentation charm the purchaser, and he willingly pays a higher price for the article of

usefulness if it is made by an artist than if it is made by a mere artisan.

Sweden is the leader in the manual-training movement, but her educators did not at first see the importance of developing correct taste among her laborers as a condition of industrial success. Accordingly, while ingenuity was increasing to some extent in that country, there was no improvement in the artistic finish and ornamentation of their goods. Other nations did not want ugly shapes in sight, and did not buy them. To have ugly utensils perpetually in view gradually works degeneration in one's taste. The figures of the commercial reports of that early day showed that we imported raw materials from Sweden, but did not buy their manufactures. In the official report of commerce and navigation of the United States for 1881 the imports from Sweden and Norway are reported as pig iron, $111,176; bar iron, $517,959; old and scrap iron, $114,883; total, $744,018. But of manufactures of iron and steel only $111,749 were reported. It is surprising to note that at that time we imported wood manufactures from them only to the small amount of $137, while we imported rags for paper manufacture to the amount of $39,090—but no manufactured clothing to speak of. The same year Belgium sent us wood manufactures to the value of $118,146, or nearly one thousand times the value of the same item from Sweden and Norway.

In 1851, at the World's Exposition in London, it became evident that English industries were not of such a character as to compete with those of France and Belgium. Prince Albert, always wise and thoughtful, set about a deep-reaching system of education that should correct the national defect and recover the prestige of British arts and manufactures. The South Kensington Museum was established, and day and evening art schools set up in all manufacturing centers. The museum placed at its foundation a collection of works showing the history of art, its beginnings, its high-water marks, and its fluctuations. On this basis instruction was given in those forms of ornamentation that the world has pronounced beautiful. There began from this time a gradual rise in the taste of the English workman; from being an artisan pure and simple he began to be an artist. England has gone forward rapidly in the direction of producing works of taste, and her useful manufactures, heretofore made without much reference to beauty, have steadily improved in tastefulness of design and execution.

The establishment of a great national art gallery, the Louvre, and the studies of French savants in the canons of good taste, had long before revolutionized French manufactures, and given France the supremacy in the world-market for goods that command high prices and ready sale.

Taking hint from England, we have had in this country something of a fever for education in art, especially in the lines of industrial drawing. Remarkable as has been our progress in the matter, yet

there is a prevalent lack of insight into the true direction and significance of this branch.

Federal aid to education.—The Federal Government, the several State governments, the churches, private beneficence, and business enterprise have all furnished important agencies in founding the several parts of the educational system of the country. Some years since this Bureau published a Circular of Information presenting the history of Federal and State aid to higher education in the United States.[1]

This circular of Dr. Blackmar has been out of print for some time. In view of the demand for information as to State and national aid to education, Chapter XXIII in the present report has been compiled, giving, in a condensed form, the amount of Federal and State aid for the establishment of higher education. This chapter requires to be supplemented by another, in which an attempt should be made to analyze the amounts reported to this Bureau since 1870 in such a way as to admit of a compilation showing the amount actually furnished from the State treasury for maintaining institutions for higher education considered apart from the income derived from the amounts given by the Federal and State governments for establishing higher education in the United States.

From the first grant to Tennessee, on its admission in 1796, up to the admission of the Dakotas, Montana, and Washington, Congress had granted about 20,000 square miles of lands to the several States specifically for the purpose of universities, or, as it was sometimes said, "seminaries of learning." Since 1889 not quite 3,260 square miles have been granted and the price fixed at $6,400 a square mile. The grants of land made previously to 1889 were either given by or followed as a precedent one of two acts, the first of which was an appendage to the ordinance of 1787 and the other the act of March 2, 1862. By the first of these acts, that of 1787, and its successor, about 20,000 square miles had been given and had been sold up to 1889 for $2,600 a square mile, on the average, in the aggregate amounting to $5,000,000. By the act of 1862 the States received 15,000 square miles, which they sold, on the average, for $704 a square mile—that is to say, they realized about $10,500,000. The matter may be stated in the following form:

	Square miles.	Realizing.
The lands granted by act of July 23 [2], 1787, and its successors in direct line up to 1889	20,000	$5,000,000
The lands granted by act of July 2, 1862, and its successors up to 1889	15,000	10,500,000
The lands granted by act admitting seven new States since 1889	3,260	20,864,000
The subsidy granted by act of August 30, 1890, capitalized at 4 per cent	.....	26,400,000
The subsidy granted by act of March 2, 1887, capitalized at 4 per cent	.....	18,000,000
Total given by United States to establish higher education	.....	80,764,000

[1] By Frank W. Blackmar, Ph. D., Circular No. 1, 1890.

[2] The university grant was not made in the ordinance of 1787 when passed July 13.

It is not possible at this date to state with the same general accuracy the amount that has been given by the States to establish higher education. But if we take what the institutions, aided by them, have accumulated in the way of value of buildings and apparatus it will give some idea of the aid afforded. The buildings and apparatus of these institutions (colleges and universities) amounted to $41,000,000 in 1896, about the same as Professor Blackmar gives for all the colleges and universities (345) in the United States ten years ago. The endowment of these institutions ("productive funds") is $51,673,000, but $30,000,000 of this belongs to Harvard, Yale, Columbia, and Cornell. In the chapter referred to above an itemized statement is given for each State. Professor Blackmar gives the endowment of all the colleges and universities in the United States in 1886 as $49,700,000.

Governmental control of learned professions.—The present year is noteworthy in the history of the medical and allied professions for the concerted action of European and some American governments in fixing standards for practice in the professions of dental and other surgery, and also in medicine in general. In Chapter XXV important data are brought together showing the progress made in the United States in this matter.

Eskimo vocabulary.—Chapter XXVII, Volume 2, is a reprint of "English-Eskimo and Eskimo-English Vocabularies," originally prepared by Mr. John W. Kelly, in charge of the whaling station at Point Barrow, and published by this office as a Circular of Information in 1890, now out of print. These vocabularies are probably the most complete that have been compiled, and are of especial value at the present time owing to the extraordinary impetus given to immigration into Alaska by the gold discoveries in that section.

Early education in North Carolina.—The beginning of the common school system in the South is traced in Chapter XXIX. To North Carolina belongs the honor of having been first of the fourteen Southern States east of the Mississippi to evolve a working system of common schools. This State is also conspicuous for the advanced position it occupied in matters of education in the constitution adopted in 1776, in the early chartering and opening of its State University, in the breadth of the educational thought shown by Archibald D. Murphey, the father of her common schools, and in the administrative ability of Rev. Calvin H. Wiley, her first general superintendent. This State, too, was alone among the Confederate States in keeping open her schools during the war. The gradual growth and development of her public system from its beginning in the report of Judge Murphey in 1817 and in the formation of the Literary Fund of 1825, are traced up to and through the war. As the success of this system was due very largely to the work of one man, the study has taken to a certain extent the form of a biography.

Geographical instruction in central Europe.—The report of this

office for 1892–93 (Volume 1, pp. 279–321) includes a chapter on the teaching of geography in Central Europe.

The subject is continued in Chapter XXXV, Volume 2 of the present report with special reference to Great Britain and France. For purposes of comparison, the matter is introduced by a brief epitome of a report on the subject by Dr. J. Scott Keltie, made to the council of the Royal Geographical Society in 1885.

Since that date, and partly as a result of the report, the study has received marked development in the countries considered, but their relative position in respect to it is practically the same. Germany still leads in the matter, although in respect to teaching appliances and to the development of the higher phases of geographical instruction, France is second to no country. Advance is noted in Great Britain, but not sufficient to bring her schools to the level of the continental schools in this respect.

Following the consideration of Dr. Keltie's report is an epitome of a recent report by M. Levasseur, the eminent statistician of France, upon the treatment of geography in the elementary and secondary schools and the universities of his own country. Reference is also made to the development of the subject in the Australian provinces and especially to the efforts of Mr. J. P. Thomson, of Brisbane, Queensland, to promote the study of geography, and by his researches and publications to increase the knowledge of the subject.

Consular reports on education.—Through the courtesy of the honorable the Secretary of State this Bureau has received many consular reports containing valuable information regarding education in foreign countries. Some extracts from these reports are collected in Chapter XXXI.

Education in Hawaii.—In Chapter XXXII the most recent information concerning education in Hawaii is furnished by General Eaton, former Commissioner of this Bureau.

Anthropology in child study.—Chapter XXXIV, Volume 2, contains an account of the growth of Toronto children, prepared by Prof. Franz Boas, of the American Museum of Natural History in New York. This paper represents the results of minute investigations on the school children of the city of Toronto, Canada, and the scientific treatment of the results obtained. Previously similar investigations at other places aimed at finding the influence of sex, occupation of parents, and descent; Professor Boas selected the influence of the order of birth, i. e., the question if first-born children have a development different from that of later-born children. The method of treating the results of such observations has largely been a comparison of averages and of the frequency of occurrence of averages between certain limits. The professor's account will be welcomed by anthropologists as a contribution to their special science.

Higher education.—The school year 1896–97 witnessed the suspen-

sion of twelve universities and colleges and the discontinuance of college work by three other institutions. This is recorded in Chapter XXXVI. The number of students pursuing liberal studies, that is, students enrolled in undergraduate and graduate departments, was 97,122, a decrease of 255 from the number reported in the preceding year. The number of such students reported by public institutions shows an increase of 1,358, thus proving that the decrease was in institutions not controlled by the States. The number of graduate students in attendance at our higher institutions is constantly increasing, the number of such students in 1896–97 having been 4,919, of which 1,413 were women. The total amount of money invested in universities, colleges, and schools of technology is $295,816,887. Of this amount $128,191,974 consists of endowment funds invested at an average rate of 4.8 per cent per annum. The benefactions to these institutions during the year amounted to $8,390,938.

Professional schools.—In the 157 theological schools mentioned in Chapter XXXVIII, there were 8,173 students, an increase of 156 over the number the previous year.

In the 77 law schools there were 10,449 students, of whom 3,106 were graduated during the year. As the number of law students in 1890 was 4,518, we see that the number was more than doubled in seven years, while the number of theological students increased by about one-eighth only in that period of time.

Medical students numbered 24,377, of whom 21,438 were enrolled in the regular schools of medicine, 2,038 in homeopathic schools, 789 in eclectic, and 112 in physiomedical. The number of students graduating in medicine during the year was 5,564. By comparing the ratio of graduates in medicine to the whole number of medical students with the ratio of graduates in law, it will be seen that much less time is required for completion of a course in law than in medicine.

The 48 dental schools had an attendance of 6,460 students, and the number of graduates was 1,640. Students of pharmacy numbered 3,426, a slight decrease from the previous year.

Normal schools.—For the school year 1896–97 there were in the various institutions reporting to this office 89,934 normal students, or students pursuing courses designed for the professional training of teachers, as shown in Chapter XXXIX. This was an increase of 5,534 over the previous year. These normal students were distributed as follows: In public normal schools, 43,199; in private normal schools, 24,181; in universities and colleges, 6,489; in public high schools, 9,001; in private high schools and academies, 7,064. The students here included are those who were actually pursuing teachers' training courses in these various institutions. Students in public and private normal schools pursuing other courses of study are accounted for in the chapter on Normal Schools, Volume 2. The 89,934 normal

If there be added to the 517,066 secondary students in public and private high schools and academies, the 51,690 secondary students in the preparatory departments of institutions of collegiate grade, the 12,730 secondary students in public and private normal schools, not normal students, and the 3,418 secondary students in manual-training schools, the grand total of secondary students in the United States reported to this Bureau is 584,904. It is a well known fact that there are in the elementary schools of nearly all the States many students pursuing secondary studies because high schools are not accessible. Could these scattering students be enumerated it is not improbable that the aggregate of secondary students would reach a figure considerably above 600,000.

Education in Alaska.—During the past two years by reason of the numerous discoveries of gold in Alaska that Territory has become an object of great interest. A school established at Circle City, on the upper Yukon, near the boundary between United States and British America, had a successful session during its first year, but on account of the removal of the inhabitants from Circle City to the region of the Klondike has lost nearly all of its pupils and has been closed for the present year. Large numbers of immigrants collected with their families at Dyea and Skagway seemed to demand accommodations for their children in school, but the present state of rapid change, not only of routes but of mining localities at the ends of those routes, makes it uncertain whether a school established for the children of the families of miners could have a longer term of existence than the one at Circle City, which seemed two years ago likely to become a permanent center for mining operations.

The missionaries representing the great bodies of Christian faith have thus far selected what may be called the strategical points for influence upon the native population of Alaska.

From the beginning, in 1885–86 on to 1893–94, it had been the policy of the Bureau of Education to subsidize mission schools in all places where it was not possible to establish Government day schools. The population of Indian villages is more or less nomadic, summering in camps on the seas and rivers at good fishing places, and wintering in their villages, located in more sheltered situations. The arrival of white immigrants has given a fixed character to these villages, in the southeast part of Alaska especially. In the southeastern region, in the presence of a larger or smaller contingent of white population, it has been found possible to establish Government schools and organize local school committees to supervise them. But in northern and western Alaska, villages with a nucleus of white population are not to be found, except at the ports of Unalaska and St. Michael; and in order to reach the natives successfully, it is necessary to avail one's self of the mission stations, 3 of which are located on the Arctic Ocean, 9 on the Bering Sea, and 7 in the river valley of the Yukon,

making a total of 19 missions with 61 missionaries. These mission stations have been located, in the light of a great deal of experience, at such places as furnish natural centers for the native population and at the same time afford the best facilities for communication with the United States in the short summer season. For the long winter season of eight to nine months no communication has been possible hitherto with northwestern Alaska.

In subsidizing the mission schools a certain minimum of school enrollment has been required, and a certain sum per pupil allowed, not to exceed in the aggregate a fixed sum agreed upon. The example of the Indian Bureau has been closely followed in this matter, except that where the Indian Bureau has allowed subsidies of $167 per annum this Bureau has allowed from $90 to $150 per pupil, boarded, clothed, and instructed, and $30 for day pupils. The maximum amount paid to contract schools appears in the year 1889–90, when the sum of $31,174.12 was paid. The largest item of that year was paid for industrial instruction and apparatus necessary to facilitate the same. In the year 1892–93 the action of Congress with regard to the Indian Bureau in the matter of contract schools was taken as indicating a policy to withdraw appropriations from contract schools, and for that reason the amount paid to contract schools in that year was reduced from $28,980 to $17,040—almost 40 per cent, and in 1893–94 it was further reduced to $8,000. In the year 1894–95 the subsidizing of contract schools was entirely discontinued, but in a few cases Government teachers were assigned to the mission stations.

The mission stations not only have the advantage of being located in important centers of the native population in the north and west, but they bring with them certain other advantages which the Government may use for its purposes of instructing the natives in the English language and in the arts of civilized life. In the first place, the mission station is a very effective center for the spread of the use of the English language among the natives, educating not only the children who come to its schools, but also the adult population attending its religious services or coming into any business relation with it whatever. I have already mentioned that there are 19 missionary centers and a corps of 61 missionaries in northwestern and central Alaska extending daily this educational influence to entire communities of Indians or Eskimos.

In 1885 General Eaton, as Commissioner of Education, secured the services of Dr. Sheldon Jackson as general agent for education in Alaska, which had recently been placed under the charge of the Secretary of the Interior. Dr. Jackson had been appointed superintendent of home missions for several States and Territories in the Northwest as early as 1869, and had distinguished himself by the vigor with which he extended the work in the far west. In 1870 he took charge of the work of home missions in the vast region from Mexico

If there be added to the 517,066 secondary students in public and private high schools and academies, the 51,690 secondary students in the preparatory departments of institutions of collegiate grade, the 12,730 secondary students in public and private normal schools, not normal students, and the 3,418 secondary students in manual-training schools, the grand total of secondary students in the United States reported to this Bureau is 584,904. It is a well known fact that there are in the elementary schools of nearly all the States many students pursuing secondary studies because high schools are not accessible. In the year 1892–93 the action of Congress with regard to the Indian Bureau in the matter of contract schools was taken as indicating a policy to withdraw appropriations from contract schools, and for that reason the amount paid to contract schools in that year was reduced from $28,980 to $17,040—almost 40 per cent, and in 1893–94 it was further reduced to $8,000. In the year 1894–95 the subsidizing of contract schools was entirely discontinued, but in a few cases Government teachers were assigned to the mission stations.

The mission stations not only have the advantage of being located in important centers of the native population in the north and west, but they bring with them certain other advantages which the Government may use for its purposes of instructing the natives in the English language and in the arts of civilized life. In the first place, the mission station is a very effective center for the spread of the use of the English language among the natives, educating not only the children who come to its schools, but also the adult population attending its religious services or coming into any business relation with it whatever. I have already mentioned that there are 19 missionary centers and a corps of 61 missionaries in northwestern and central Alaska extending daily this educational influence to entire communities of Indians or Eskimos.

In 1885 General Eaton, as Commissioner of Education, secured the services of Dr. Sheldon Jackson as general agent for education in Alaska, which had recently been placed under the charge of the Secretary of the Interior. Dr. Jackson had been appointed superintendent of home missions for several States and Territories in the Northwest as early as 1869, and had distinguished himself by the vigor with which he extended the work in the far west. In 1870 he took charge of the work of home missions in the vast region from Mexico

to Canada and from Nevada to Nebraska. In the early days before railroads had penetrated those regions he traveled on foot or used ox carts or mustang ponies. In the prosecution of his work he traveled in thirteen years 345,027 miles, or an average of 26,540 miles a year. He established and for ten years conducted the "Rocky Mountain Presbyterian." In 1877 he visited Alaska as the first ordained missionary from the United States, and in the next eight years he rapidly established schools and churches in the archipelago, and commenced the process of civilization which has gone on in Alaska ever since. In 1880 he built the church and founded the Industrial Training School for native children at Sitka.

After his appointment as United States agent his trips to the northwest were undertaken for the most part in the *Bear*, a revenue cutter sent out annually by the Secretary of the Treasury. Its captain (M. A. Healy) interested himself warmly in the cause represented by Dr. Jackson in this region, and to him is due in a measure the success in establishing schools in northwest Alaska. And to him and Dr. Jackson is due the original suggestion of the plan of stocking the enormous moss fields of Alaska with herds of reindeer and the training of the natives into skilled herdsmen and teamsters.

It had been obvious, from the beginning of the Government subsidies in 1885–86, that there should be not only education in elementary English branches, but also a training in the employments of civilized life. From the first, at all the missions there was instruction in cooking, housekeeping, and clothes making. Then followed more careful education in the trades of carpentering, blacksmithing, and shoemaking, subsidizing for this instruction the Presbyterian Industrial School at Sitka. As early as 1891 the matter of the introduction of reindeer into Alaska had been brought to my attention by Dr. Sheldon Jackson and Captain Healy, of the United States revenue cutter *Bear*. Upon learning that tame reindeer could be obtained from points in Siberia opposite to Alaska, and that all of Alaska (excepting the river valleys and places on the coast covered with forests) bore large quantities of the kind of moss that furnishes the best food for the reindeer, I became so much interested in the project of introducing the reindeer into northwestern Alaska that I urged Dr. Jackson to appeal to the friends of missionary education for a preliminary sum to begin the experiment at once. From the sum of $2,156 thus procured a first purchase of 16 deer was made in the summer of 1891, and a herd of 171 in the summer of 1892. The Government appropriation of $6,000 became available for the support of reindeer in the summer of 1893, and a further purchase of 124 deer was made, and for the summer of 1894 a still further purchase of 123 was made out of an appropriation of $7,500, making a total of 538 deer purchased in Siberia and placed in a Government herd near Port Clarence. The 16 deer purchased in 1891 have been

allowed to run wild on one of the eastern Aleutian Islands, and since then have in a measure stocked that island with reindeer. From this original herd of 538 reindeer a total number of 1,323 fawns have been born, making an aggregate of 1,861, of which 395 have been lost, injured, or killed in various ways during the five years, leaving 1,466 reindeer in the herds August, 1897.

A plan has been gradually matured for the use of these reindeer in the scheme of education. Two objects are to be secured: (1) The training of the natives as herders and as teamsters. This implies that the natives must be interested in the project; they must take the long step from nomadic fishermen and hunters to dwellers in villages, with permanent employments that will support them and also render them useful to a white population which will eventually come to central and northwestern Alaska. (2) The other important object to be gained is the education of these natives in thrift, so that they will preserve and accumulate the reindeer intrusted to them.

At each mission station there is constantly going on a process of selecting the trustworthy natives—those ambitious to learn the civilization of the white men, those ambitious to hold and increase property. Reindeer intrusted to the ordinary individual savage would disappear within twelve months after the gift.

At the reindeer station a number of apprentices have been selected and rewards for intelligent and persevering industry offered. They were to receive two reindeer for the first year's apprenticeship; at the end of the second year five more, in such a way as to gradually develop the sense of individual ownership of property—a sense which has never been developed in the tribal relation.

[From letter of instruction by Dr. Jackson to the superintendent of the reindeer herd.]

PORT CLARENCE,
UNITED STATES REVENUE-MARINE STEAMER BEAR,
July 4, 1893.

SIR: * * * The herders are to be fed and clothed and housed, also furnished with tobacco or its equivalent, at Government expense. The Siberian herders and the experienced Eskimo, each one will receive, in addition to the above, $50 worth of barter goods at the end of the year and the inexperienced ones $30 worth. If they prefer it they can be paid a portion of the above from time to time as they may need it, only that at the end of the year the amount received shall not exceed the total amount allowed.

When food is plenty and cheap you will purchase with the supplies at the station such oil, meat, dried fish, skins, etc., as are needed at the station. You are also authorized to purchase wood from the natives.

In addition to the paid herders, it is desired that you take into the station a number of wide-awake young men to learn the management of deer. They will be fed, clothed, and housed at Government expense. If they have been faithful to their duties and have shown aptitude in learning for one full year at the station you are authorized to allow them two deer, which can be marked with their brand, but must be continued in the general herd. At the end of the second year you can give them five more. I think it will be well to encourage them to remain with

the herd for three or four years, when they will have sufficient deer, so that two or three of the herders, by combining their holdings, can start a new herd.

If, after a fair trial of a few months, a young man is lazy, indifferent, or dull, you had better send him away from the station and give his place to a more promising one. There is a constant sifting process going on among white men, and the same process is equally needful among the natives.

I would like the first herders especially to be picked men—the ablest and best among their people—as that class will alone secure the best results from the introduction of the deer.

Under the regulations established 9 apprentices have received reindeer—from 2 to 7 each. The total number of reindeer originally assigned to them being 52, the same had increased last August by the birth of fawns to 133.

From the beginning, schoolbooks and apparatus have been furnished for the schools in Alaska. Reindeer are the schoolbooks and apparatus necessary for the education of the western and northern natives. To secure the chief object aimed at in the importation of reindeer from Siberia, it is evident that the reindeer must eventually come into the hands of thrifty persons among the natives, who will preserve the herds, increase them, break them to harness, and make them available, under the management of trained teamsters, for the use of white immigrants who settle in Alaska. The missionary stations furnish the only safe centers for the location of herds and the establishment of schools of instruction in the rearing of the reindeer and in the training of them to harness.

As already mentioned, the missions ascertain the capable and teachable youth among the natives. They are able at any time to furnish a list of the natives in their vicinities noted for good character. At each of these stations 20 or 30 youth, selected from a village population of 300 or more, can be put in training as herdsmen and teamsters. No matter how large the Government appropriation should be, therefore, it would be necessary to connect the reindeer instruction and the establishment of permanent herds in northwest Alaska with these missionary stations.

The small herds loaned to each missionary station as a Government aid are in the nature of an outfit of industrial apparatus. The report of the Indian Bureau shows that the United States Government furnished 10,000 head of stock for the period of 1890–96 for one Indian agency (the Blackfeet), and that seeds, implements, stock, wagons, harness, in large amounts, have been furnished to other agencies. These donations are certainly more justifiable than donations made to prevent the savage peoples from starving, for they are given in the form of apparatus for the instruction of these peoples in the industrial arts and in the practice of thrift. All these things prevent starvation. Just as in the agricultural colleges of the several States the Government money is used to pay for the stock of the model farm, which is used as the apparatus for the instruction of the

pupils, so the reindeer herd is used as apparatus loaned to the missionary stations for the purpose of instruction of the natives. But from three to five years' apprenticeship is needed for the full training of apprentices in the management of reindeer.

Persons who have been brought up to the care of neat cattle and horses, or sheep only, have not thereby acquired the art of managing reindeer, for this requires special apprenticeship. With the first herd (that of 1892) Siberian herdsmen were procured to give instruction in these arts, but the degree of success was so small that in 1894 five families of Laplanders were obtained to take their place. The Laplanders, being a civilized people and devoid of the superstitions which embarrass the Siberian natives, have attained a higher degree of skill in the management of this animal, and also show greater ability in teaching others what they know. After obtaining the reindeer, therefore, the next important matter is the procurement of skilled herdsmen and teamsters from Norway and Sweden. It is of little use to give a herd of reindeer to a missionary station unless a skilled teacher goes with it.

The furnishing of the properly trained Laplander is one of the chief items of expense in the introduction of reindeer into northwestern Alaska. A salary of $200 to $500 a year is necessary for each, and the distribution of the herd at the different points on the seacoast and in the interior is possible only in so far as the Government is able to send these experienced herdsmen and teamsters. In the course of eight or ten years there will grow up a supply of thoroughly educated natives who will render it unnecessary to depend any longer upon Lapland and Finland for teachers. But it is hoped in the meanwhile that there will be some migration from Scandinavia of families of herdsmen and teamsters.

Thus far the original plan of distributing small herds to the missionary stations and furnishing teachers to care for the herds has been put into operation in only four instances. To the missionary station at Cape Prince of Wales, nearest to the Teller Station at Port Clarence, 118 deer were furnished in August, 1894, and Mr. Lopp, who had mastered the art of caring for the reindeer, having been with our herd from the beginning, was made the Government teacher and paid a salary.

The following year 112 deer were loaned to the most promising apprentice, Anti-sarlook (called Charlie), stationed at Cape Nome. In 1896 two other herds of 50 each were loaned, respectively, to the Swedish Evangelical Mission on Golovin Bay and the Episcopal Mission at Fort Adams, on the middle Yukon, near the mouth of the Tanana River. These herds have been loaned on the condition that they are used as apparatus for the instruction of natives in the art of herding deer and training them to harness, and on condition that after three years the Government *may take from* the herd a number of

deer in good condition equal to the original number furnished, the stations retaining the increase. And, pursuing this policy, negotiations have been for some time in progress to loan herds on the same conditions to the Catholic stations at Nulato and Koserefski (important places on the Yukon) and also to the stations at Point Hope (Episcopal) and Point Barrow (Presbyterian) on the Arctic Sea; also to the Moravian stations at Bethel, on the Kuskokwim River, and Carmel, on Bristol Bay, at the entrance to the Bering Sea on the south.

In providing education for Alaska it is important that the centers of industrial education shall coincide with the points that have to be held in hand by the Government for the purposes of relief expeditions, and also with those points from which the mining and other industrial interests of Alaska can be governed. To illustrate this I mention the fact that if the herds which it is proposed to establish at Point Barrow and Point Hope, on the Arctic Ocean, can by any means be increased to the number of 5,000 deer, a number not unusual in Lapland as the possession of a single herdsman, the annual increase of such a herd would amount to nearly 2,000 fawns. It is obvious that with such resources at two points on the Arctic there never need be any further fear of starvation on the part of the crews of whaling vessels detained by ice in that region. A saving of at least $50,000 to the Government would have been effected during the year 1897–98 had those herds been in position. Again, had herds of 5,000 each been at the important strategical points of Nulato, on the great bend of the Yukon, at Fort Adams, in the middle Yukon, at the mouth of Tanana River, or at Circle City, on the upper Yukon, the danger to starving miners would have been very much reduced, if not entirely removed.

Communication with Alaska.—The difficulty met with by all those who would visit Alaska is the impossibility of traversing its vast distances in the winter. This is the great obstacle to the miner who wishes to have access to the gold-bearing regions and to carry with him all the conveniences for procuring comfort in the long arctic night. He wishes also to be in constant communication with the friends he has left behind him in the States. This is also the great obstacle to the missionary who wishes to reach the tribes of native population, convert them to Christianity and lead them to adopt the arts of civilized life.

Looking at the map of Alaska, one sees that the great Yukon River penetrates the interior from the west, forming a sort of backbone to the country. Not realizing the climatic conditions, one would suppose that steamboats could keep up for a large portion of the year a communication with the upper branches of that river situated in British America and in the eastern part of Alaska. When he comes to learn, however, that the Yukon River is closed by ice for three-fourths of the year, he looks southward for other avenues to the interior and first notices the inlets of the Northern Pacific between Sitka and

Unalaska, namely, Prince William Sound, Cooks Inlet, and Copper River. But he finds first high mountains and then a vast table-land extending to the north of these places and separating by a distance of from 500 to 700 miles the mining regions of the upper Yukon from the shipping ports on the ocean. These table-lands can not be traversed in the winter by horses or oxen and scarcely even by the hardy species of dogs that are used for transportation in this region. When one considers the difficulties of a journey of 500 to 700 miles through a region without settlements and without stores of provisions, one looks for another approach to the region, namely, to that from the southeast. Bays, or rivers flowing into the archipelago, at the southeast will bring the traveler to the foot of the mountains; then if a good pass may be found that can be used winter and summer, or if its difficulties can be overcome by means of railroads or some method of rapid transportation, the visitor to the interior may find himself at the head waters of the Yukon. In the future of this Territory it is evident that settlements will be formed at distances from 100 to 300 miles apart from the head waters to the mouth of the river. The natural entrance, therefore, into this region in the winter time would appear to be the gateways at the southeast, at the northern extremities of Lynn Sound, or perhaps at Yakutat Bay. This question of communication with Alaska is so important that it deserves a fuller discussion.

I. The approach to Alaska by way of Bering Sea inadequate for purposes of the Government.—Vessels that pass into Bering Sea stop at the island of Unalaska, where a village of about 300 people is situated, which contains a Russian church and a Methodist mission. On an island in this harbor, too, the first reindeer, 16 in number, obtained in 1891 for the purpose of introducing the reindeer culture into the schools of northwest Alaska, were turned loose and have increased to a considerable herd, but are running wild on the island.

It has not been possible in ordinary winters to continue the voyage beyond Unalaska (which is the eastern link of the chain known as the Aleutian Islands) into the Bering Sea beyond the Pribyloff Islands in winter. On one occasion, however, St. Matthews Island, 400 miles north of the Pribyloff and about 200 miles south by west of St. Lawrence Island and 400 miles from Bering Strait, was reached, but no vessels have ever been able to land at St. Michael or approach the mouth of the Yukon or any of the bays north or south of this region within a radius of from 50 to 100 miles from the mainland on account of the ice. The ice closes in these ports as early as November 1, and they are not open again until the 15th of June and occasionally (as in 1896) not until the middle of July. These northwestern ports are therefore closed to the Government and to commerce from seven and one-half to eight and one-half months in the year, leaving from three and one-half to four and one-*half months for* the entire season's work in the *northwest.*

II. The approach to the interior of Alaska by way of the inlets of the ocean between Sitka and Unalaska.—The management of interior Alaska could not be conducted by Bering Sea. But it might be conducted either from some one of the ports on Prince William Sound, or Copper River, which empties next to it on the east, or from Cooks Inlet to the west of it. Some of the streams flowing into these inlets rise near the headwaters of the Tanana, the Forty-Mile Creek, and the White River—the Tanana flowing into the middle Yukon, the Forty-Mile Creek flowing into the Yukon near the place where the Yukon crosses the boundary line that separates Alaska from the British possessions, and the White River flowing into the Yukon some 50 miles above Dawson in British territory. Should a transportation company build a railroad over this route it would furnish a short and ready communication from the south immediately into the river valleys that are rich in gold, and large villages would grow up very soon at the harbor which formed the starting point of the railroad and at its junction and termini. This route would have the advantage of being wholly within the boundaries of Alaska. On this line, at the headwaters of the four rivers mentioned, one branch could go down the Tanana River to Minook on the middle Yukon, and the other branch might approach the upper Yukon with a terminus at or about Circle City or some point farther south, nearer the British boundary and the gold mines of the Klondike. Should this railroad not be built by private parties, an express and mail route could be established by reindeer with relay houses built on the entire route at intervals of from 10 to 20 miles, stocked with provisions and each guarded by one or two soldiers. But the reindeer route could not follow the canyons of the rivers nor extend into the wooded regions near the ocean, because of the lack of moss. The general rule is that where trees grow the moss is not to be found. The moss feeds directly on the rocks until a humus or soil is formed, and then trees begin to grow. Where there is plenty of moisture, as in the river valleys and the coast region, the moss has already given place to trees.

The distance from the southern harbor to the head waters is about 250 miles, and thence to Minook, at the junction of the Tanana and Yukon rivers, is about 300 miles, and about the same distance to the Yukon on the east. Over a good trail in the moss-covered district the reindeer team with the mail could travel at the rate of 100 to 200 miles in the twenty-four hours if relays are furnished once in 50 miles. For in the arctic night one part of the twenty-four hours is as good as another for making a journey. Consequently the mail from the upper Yukon, and all points down to the middle Yukon, could reach, as before asserted, the ocean steamer at Prince William Sound in six days from Minook, and in eight days more would reach Seattle, making communication from all the upper parts of the Yukon two weeks old on reaching Seattle.

Another point of importance is that all of northwest Alaska can be

reached by reindeer express from Minook, near the mouth of the Tanana on the middle Yukon. The distance from Minook to St. Michael is about 600 miles, and from Minook to Cape Prince of Wales about 800 miles. It is evident that with reindeer all the way, or with a railroad for a part of the way from Prince William Sound, all parts of Alaska can be reached by reindeer transportation at any time in the winter, and with 50-mile relays the reindeer could bring mail from St. Michael to Minook in six days, and in eight days all the way from Cape Prince of Wales to Minook, or even from Point Barrow, which is the same distance from Minook as the Cape Prince of Wales. Commercial companies could then hear from their whaling fleets, getting news not more than a month old on arrival at Seattle.

III. The approach to the interior of Alaska by Chilkat on the southeast.—Southeastern Alaska, including the Alexander Archipelago, in which Sitka and the neighboring islands are situated, is accessible at all times of the year. A bimonthly steamer has for years sailed from Seattle to the northernmost inlet which opens beyond Juneau and extends to Dyea. Since the gold excitement trips are more frequent. Of the harbors in the north of this inlet up Lynn Sound, those at Chilkat and Haines, are deep; that of Dyea is shallow.

Inasmuch as the matter of opening up a railroad communication from Prince William Sound or from Cooks Inlet is a mere project, and inasmuch as it would not be feasible to make a reindeer route to or from either of these places until oceanic steamship lines, or an extension of the steamship line from Sitka has made terminal points of these places, the only alternative for the present action is to complete communication from Chilkat or Haines in the northern inlets of the headwaters of the channel with the upper Yukon by White Pass (from Skagway), Chilkoot Pass (from Dyea), or by Chilkat Pass at the headwaters of the Chilkat River to Lake Arkell, or farther to the west on a route sometimes called the "Dalton trail," a Mr. Dalton having the past season driven some 500 head of cattle and 6,000 sheep over this route to the gold regions. If a railroad should be constructed from Dyea to the navigable waters that descend into the Yukon, there would still be occasion for reindeer transportation 400 or 500 miles beyond to the gold regions for seven or eights months in the year.

The winter climate of Alaska.—It is very difficult to realize the conditions prevalent in Alaska in the winter time. In places where the wind from the southwest comes laden with moisture from the ocean, the snow sometimes falls in the course of the winter to a depth of 12 feet. Where the high mountains cause the south winds to lose a large portion of their moisture the snow fall is much less. The temperature in some months of the year will average many degrees below zero, frequently dipping as low as 50, 60, or even 70 degrees below zero, Fahrenheit. Other months of the same winter will have a temperature, for the entire month, of from *zero to freezing point*, comparatively comfortable *weather. The meteorological records* kept in this region show

that the coldest month may be December, January, or February. There is great variation from one year to another. Sometimes there is a month in which a storm occurs on an average twice a week for a whole month together. In order to imagine the terrors of a storm in Alaska, one must conceive a perpetual night varying from twilight at midday to the blackest darkness for three-fourths of the day, and in this night he must conceive a Minnesota blizzard in which the thermometer instead of varying from zero to 30 degrees below, as in Minnesota, varies from 30 to 60 degrees below. The impossibility of combating such a storm is obvious.

Communication over the surface of the snow.—For eight months of the year central and northern Alaska may be conceived as a vast snow field; it is not the more difficult to penetrate on that account, however. The snow covers the region like a vast white asphalt pavement. It fills up the small crevices and the deep gulches and makes one smooth surface undulating with the hills and valleys. On the surface of the snow is a hard crust which will bear up men and animals and especially the reindeer with his broad foot. While the winter time can not be used at all for transportation on the Arctic Ocean or Bering Sea or on the rivers of Alaska, the long winter is capable of being used by the reindeer for communication throughout the interior. On a snow surface, with not too steep hills or too deep valleys, the reindeer can travel his 50, 70, or even 90 miles a day, getting his food at meal times by thrusting his tough lips through the snow to the moss.

The supply of reindeer moss for food.—Conceive all Alaska as one vast rock. The forces of nature—the sun, the rains, the frosts, the vital power of the seeds of the moss and of hardy trees—all these elements work on the rock to subdue it for vegetation. On the coast near the ocean where the winds are laden with moisture as well as on the river valleys the first beginnings of vegetation appeared. The rock was eaten into by the moss plant. After the moss had flourished for untold ages it had created a humus or soil in which the seeds of other plants could take root. The moss epoch then was followed by the tree epoch. When the trees grew in the river valleys and on the coast regions the moss could not any longer flourish. But by this time the moss had conquered the rock regions far up the mountain sides and over all the hills in Alaska even up to the Arctic Ocean. This gives at one glance the actual view of the situation in Alaska. Around the southern coasts and in the river valleys trees flourish and moss is not found. Back on the hills and for a mile up the high mountains reindeer moss is to be found in immense quantities. A careful estimate finds sufficient food for ten millions of reindeer, basing the estimate on the present capacity of Finland and Lapland for the support of the reindeer.

But the routes for reindeer travel must not be laid out in river valleys nor along the coast of the ocean. The reindeer would starve on account of lack of moss. This was the actual experience in the journey

made by Mr. Kjellmann in the winter of 1897, from Port Clarence south to Bristol Bay. He accomplished the other parts of his journey, even the scaling of high mountain passes without difficulty, but in attempting to conduct a portion of his return journey through the forest between the Kuskokwim and Yukon rivers he could not find moss enough to subsist his reindeer except by cutting down trees and using an inferior quality of moss. As it was, a half dozen of his deer perished. These reindeer journeys can be accomplished only on trails leading over the hills above the river valleys.

The introduction of reindeer from Siberia into Alaska.—The importation of reindeer from Siberia has settled favorably all the questions of the Alaska problem except the facility of obtaining a supply and the possibility of obtaining it at any time of the year.

The following table shows at a glance the number imported each year already mentioned above:

Year.	Number.	Year.	Number.
1891	16	1895	123
1892	171		
1893	124		
1894	120	Total	554

The 16 reindeer obtained in 1891 were turned loose on Amaknak Island, Unalaska, and have increased, but the exact number is not now known. The other 538 deer have been herded carefully and their present number is 1,466, of which 466 was the increase in fawns in the spring of 1897.

It will be seen by the above table that 538 reindeer purchased during the four years, 1892 to 1895, an average of 134 per annum, have increased to 1,466 deer. It is said that the deer born on the American side are heavier than the average deer imported from Siberia. If the Government herd amounted to 5,000 deer the annual increase would be between 2,000 and 3,000, a sufficient number to stock all the mission stations in Alaska.

The following table shows the location of these deer on June 30, 1897:

	Old deer.	Fawns.	Total.
1. Government herd, Teller Station	343	126	469
2. Cape Nome herd	193	85	278
3. Swedish herd, Golovin Bay	70	40	110
4. Episcopal herd, Golovin Bay	69	40	109
5. Cape Prince of Wales herd	243	124	367
6. Ta-vo-tuk, apprentice, Teller Station	15	11	26
7. Se-keog-look, apprentice, Teller Station	7	5	12
8. Wocksock, apprentice, Teller Station	2	6	
9. Ah-Look, apprentice, Teller Station	3	2	
10. Electoona, apprentice, Teller Station	4	3	
11. Moses, apprentice, Golovin Bay	20	11	31
12. Martin, apprentice, Golovin Bay	12	7	19
13. Okitkon, apprentice, Golovin Bay	10	5	15
14. Tatpan, apprentice, Golovin Bay	7	5	12
Total	1,000	466	1,466

Herds numbered 2 and 5 have been ordered to Point Barrow to relieve suffering whalers. Two hundred deer trained to harness, or as near that number as could be obtained, were ordered on September 22, 1897, to St. Michael by the honorable the Secretary of the Interior to assist in moving supplies to mines in the Yukon Valley.

The following table shows the annual increase and the number received from previous year:

	1891.	1892.	1893.	1894.	1895.	1896.	1897.
Total from previous year	.....	.....	143	323	492	743	1,000
Fawns surviving	.....	.....	79	145	276	357	466
Purchased during summer	16	171	124	120	123	.....	.....
Total October 1	.....	171	346	588	891	1,100	1,466
Loss	.....	28	23	96	148	100	.....
Carried forward	.....	143	323	492	743	1,000	.....

The herdsmen first imported from Siberia were members of the Indian tribes, superstitious and uncivilized in their habits. Their method of caring for the deer during the time of fawning was not good.

Since obtaining five families (seventeen persons in all) from Lapland in 1894 the training of the reindeer has proceeded more satisfactorily. The Eskimo apprentices, some twenty-five in number, have learned enough to make them good assistant herdsmen and two of them are excellent teamsters; but it would seem that five years' apprenticeship is required to make intelligent people well acquainted with all the methods needed in training the reindeer to harness, in caring for the young, and with the various other arts which are in possession of the herdsmen's families in Finland and Lapland.

The great difficulty, however, in the experiment in northwestern Alaska is the obtaining of efficient herdsmen. Three of the families of Lapps, after remaining the three years agreed upon, have returned to Lapland. While two skilled Lapp herders, with their boys and with Eskimo apprentices, can handle a large herd of 1,000 or 2,000 reindeer, it requires one Laplander to each ten reindeer trained to the harness as teamsters.

The one link necessary for this satisfactory solution of Alaskan problems is the supply of a sufficient number of reindeer trained to the harness and herders and teamsters from Lapland and Finland skilled in the business. While the deer are large and strong the herdsmen and teamsters obtained from Siberia are of little avail. The methods of the Laplanders, which have been tried during the past three years, have proved to be far better than those of the Siberians. They are superior to the Siberians in the management of the reindeer in the harness, in kindness to them, in civilized habits of living (the Laplanders being a Christian people, the Siberians having a low form of fetichism), and in the use of a language that is known to Europeans.

Of transportation by dogs, Dr. Jackson says:

The dog in the Arctic seems to be a middle-sized one, with much of the appearance and habits of the wolf. They are a hardy animal, suited to their environment. From five to eight make a good team. They are frequently hitched up tandem. When traveling an attendant usually runs in front, while a second guides the sled. They will make as many miles in a day as the attendant running in front can lead them, and will carry on the sled about 125 pounds to the dog. When traveling they are fed from 1 to 1½ pounds of dry fish per day. When at home they are allowed to forage for themselves. If a sled load of freight is drawn by dogs a second sled load is necessary for carrying provisions for the two teams of dogs, if the journey is a long one. Consequently it is impossible to utilize dogs on journeys very distant from sources of supply of dog food. Since the rapid increase of the white population in Alaska, and the development of the mines, dog transportation has proved entirely inadequate, although the necessity has been so great that the price of dogs has run up to $100 and $200 apiece. A year ago this fall the steamer *Bella* was frozen in at Fort Yukon, 80 miles distant from Circle City. An effort was made to forward the provisions from the steamer by dog teams on the ice to Circle City and Dawson, but the effort failed. It was found impossible to move the food in sufficient quantities and with sufficient speed to supply the miners of the Yukon, and by spring flour had advanced at Dawson City from $50 to $125 per hundred pounds.

The Bureau of Education has been charged with the care of education in Alaska. The object proposed from the beginning by the Commissioners preceding me, General Eaton and Colonel Dawson, has been to provide such education as to prepare the natives to take up the industries and modes of life established in the States by our white population, and by all means not try to continue the tribal life after the manner of the Indians in the western States and Territories. If the natives of Alaska could be taught the English language, be brought under Christian influences by the missionaries and trained into the forms of industry suitable for the Territory, it seems to follow as a necessary result that the white population of Alaska, composed of immigrants from the States, would be able to employ them in their pursuits, using their labor to assist in mining, transportation, and in the production of food. A population of 40,000 natives engaged in reindeer herding and transportation would furnish the contingent needed to complement or make possible the mining industry. After cautious experiments in 1891, 1892, and 1893, and especially after the arrival of the Lapland families as herdsmen in 1894, it has become certain that the experiment will prove a success. A herd of from 100 to 500 reindeer should be placed at each mission station together with a Lapland herdsman who can instruct twenty or thirty apprentices in the management of the deer. The wages for work done in behalf of the mission station, as has been shown, can be paid by the transfer of reindeer to these apprentices, so that after sufficient skill has been acquired the apprentices will have with them the nucleus of a herd of reindeer to commence their career with. They and their sons will by and by take the reindeer trained for harness and find a profitable employment with transportation companies. At home a

large herd will accumulate, furnishing food in the form of reindeer milk and reindeer meat.

The following list of missionary stations will show how the entire territory is commanded from these strategical points.

1. On the Arctic are located the following:

	Denomination.	Teachers.
1. Point Barrow	Presbyterian (Government school)	One missionary.
2. Point Hope	Episcopal	Do.
3. Kotzebue Sound	Quaker	Three missionaries.

With herds of from 1,000 to 5,000 at each of these stations as already intimated, there need never be the slightest fear regarding the whalers who are caught in the ice before reaching Bering Strait. If they can not bring their vessels to the protected harbors near by the missionary stations they can at least escape over the ice and obtain sure subsistence until spring time. They can load their vessels, in fact, with supplies from one of these stations and on the breaking up of the ice in the spring continue their whaling voyages.

2. The following missionary stations are located along the coast from Bering Strait to Unalaska in the Bering Sea:

	Denomination.	Teachers.
4. Cape Prince of Wales	Congregational	Two missionaries.
5. St. Lawrence Island	Presbyterian	Do.
6. do	Government school	One teacher.
6. Golovin Bay	Swedish Lutheran	Three missionaries.
7. Kangekosook	do	Two missionaries.
8. Unalaklik	do	Do.
9. St. Joseph	Roman Catholic	Seven missionaries.
10. Cape Vancouver	do	Two missionaries.
11. Bethel	Moravian	Five missionaries.
12. Carmel	do	Four missionaries.

It has been shown that stations like those on the Arctic Ocean can all be placed in sufficient communication in the winter months with the States through reindeer expresses sent with the mail to and from Minook, on the middle Yukon, the most distant station being only four days out by the swiftest mail, established by relays, or only sixteen days by the slowest form of reindeer express.

3. The missionary stations on the Yukon are the following:

	Denomination.	Teachers.
13. Igavig	Moravian	Two missionaries.
14. Ikkamute	Roman Catholic	One missionary.
15. Koserefski	do	Eleven missionaries.
16. Sacred Heart	do	
17. Anvik	Episcopal	Three missionaries.
18. Nulato	Roman Catholic	Do.
19. Circle City	Episcopal	Two missionaries.

While the stations on the Arctic Sea are of vital importance for the safety of the whaling fleet, those on the Yukon are of vital impor-

tance for transportation in the winter time, and besides the missionary stations there will doubtless spring up many camps of miners from the middle Yukon on to its highest sources and also along all of the tributaries on which gold may be found. It is too much to expect that miners will raise herds of reindeer, or indeed that reindeer can possibly be raised in the immediate vicinity of a mining camp, but the missionary stations removed at a safe distance from these villages can produce hundreds and thousands of reindeer, together with skilled natives who have learned to speak the English language and have acquired the manners and customs of our people. These will become herdsmen and teamsters for the mines.

4. The Aleutian Islands. On one of these (20) Unalaska has a missionary establishment, Methodist, with two missionaries and one Government teacher.

The Aleutian Islands are all said to be moss-bearing, and they should all have herds of reindeer. If not tame, at least a few should be placed on each island to run wild and stock the pastures.

5. The missionary stations along the northern Pacific Coast between Sitka and Unalaska are:

	Denomination.	Teachers.
21. Wood Island	Baptist	Four missionaries.
22. Yakutat	Swedish Lutheran	Three missionaries.
23. Kadiak[1]		One Government teacher.
24. Afognak[1]		Do.
25. Unga[1]		Do.

[1] Government schools.

The voyage from Sitka to Unalaska, almost directly west, is 1,200 miles. Along this coast the above missionary stations are established. Transportation with the interior of Alaska from these stations will be made possible by the possession of reindeer herds.

6. The missionary stations in the Sitka Archipelago at the southeast are:

	Denomination.	Teachers.
26. Haines	Presbyterian	Four missionaries.
26. do	Government school	One teacher.
27. Hoonah	Presbyterian	Four missionaries.
27. do	Government school	One teacher.
28. Juneau	Presbyterian	Three missionaries.
29. do	Episcopal	One missionary.
30. do	Roman Catholic	Three missionaries.
31. Douglas	Quaker	Do.
31. do	Two Government schools	Two teachers.
32. Sitka	Presbyterian	Twelve missionaries.
32. do	Two Government schools	Five teachers.
33. do	Episcopal	One missionary.
34. Kake	Quaker	Two missionaries.
35. Fort Wrangel	Presbyterian	Do.
35. do	Government school	One teacher.
36. Saxman	Presbyterian	Two teachers.
36. do	Government school	Do.
37. Jackson	Presbyterian	Four missionaries.
37. do	Government school	One teacher.
38. Metlakahtla	Independent	One missionary and assistants.

These stations can not at present be used for education in the art of managing the reindeer for the lack of moss fields. It is therefore deemed very important that a large herd of reindeer should be placed as near as possible to this region, namely, at some point northwest of the Lynn Canal, as near as possible to Chilkat. To this place could be sent enterprising and promising young men from the mission schools in the Sitka Archipelago to be trained for teamsters and herdsmen, for it is at this point, as has already been pointed out, that the problem of winter communication with Alaska, so necessary to its Government management, must be solved.

The reindeer transportation must move out from the north of the Lynn Canal at Chilkat or Dyea. There should be an appropriation of $25,000 per annum for the expense of the camp of a reindeer station at this place—that is, as near as possible to the Lynn Canal—although probably the place selected on Alaskan territory for this purpose must be between the headwaters of the Tanana and White rivers, and 300 miles northwest of Chilkat. This herd should be increased from year to year until it amounts to 5,000, in order to hurry forward the work of developing the resources of Alaska by reindeer culture.

The Government may ultimately be able from time to time to dispose of a sufficient number of these reindeer to reimburse the Treasury for the expense incurred. It is desirable, of course, as soon as possible after a demonstration has been made of the practicability of the scheme and its best methods have been discovered, that private enterprise shall take up and carry on the industry, but it is all important that at least one part of the reindeer industry should be kept along its present lines until the natives of Alaska have been elevated from the status of a hunting and fishing civilization to that of farming and grazing. But if the reindeer enterprise gets entirely into the control of private business parties before this is accomplished its benefits may be turned away from the native people. It is therefore very important that the missionary stations shall be supplied with reindeer herds after the plan already inaugurated by this Bureau.

All of which is respectfully submitted.

W. T. HARRIS,
Commissioner.

Hon. CORNELIUS N. BLISS,
Secretary of the Interior.

STATISTICS OF STATE COMMON-SCHOOL SYSTEMS.

These stations can not at present be used for education in the art of managing the reindeer for the lack of moss fields. It is therefore deemed very important that a large herd of reindeer should be placed as near as possible to this region, namely, at some point northwest of the Lynn Canal, as near as possible to Chilkat. To this place could be sent enterprising and promising young men from the mission schools in the Sitka Archipelago to be trained for teamsters and herdsmen, for it is at this point, as has already been pointed out, that the problem of winter communication with Alaska, so necessary to its Government management, must be solved.

The reindeer transportation must move out from the north of the Lynn Canal at Chilkat or Dyea. There should be an appropriation of $25,000 per annum for the expense of the camp of a reindeer station at this place—that is, as near as possible to the Lynn Canal—although probably the place selected on Alaskan territory for this purpose must be between the headwaters of the Tanana and White rivers, and 300 miles northwest of Chilkat. This herd should be increased from year to year until it amounts to 5,000, in order to hurry forward the work of developing the resources of Alaska by reindeer culture.

The Government may ultimately be able from time to time to dispose of a sufficient number of these reindeer to reimburse the Treasury for the expense incurred. It is desirable, of course, as soon as possible after a demonstration has been made of the practicability of the scheme and its best methods have been discovered, that private enterprise shall take up and carry on the industry, but it is all important that at least one part of the reindeer industry should be kept along its present lines until the natives of Alaska have been elevated from the status of a hunting and fishing civilization to that of farming and grazing. But if the reindeer enterprise gets entirely into the control of private business parties before this is accomplished its benefits may be turned away from the native people. It is therefore very important that the missionary stations shall be supplied with reindeer herds after the plan already inaugurated by this Bureau.

All of which is respectfully submitted.

a Certain States report their school term in months. These have been uniformly reduced to days by multiplying by 20.
b In 1895-96.
c Approximately.
d In 1891-92.
e In 1894-95.
f In 1893-94.

Observations on Table 8.—The "aggregate number of days' schooling given" to all pupils (see column 6), which is the same thing as the aggregate number of days attended by all the pupils, has been computed for those States which do not make an explicit report of this item by multiplying the average daily attendance of pupils by the average length of school term in days.

Conversely, the average length of school term (column 5) for the United States as a whole and for each of its geographical divisions has been obtained by dividing the aggregate number of days attended by the average daily attendance.

By this method the school term of each State, in computing the average term for a number of States, is in fact given a weight proportioned to the school attendance of the State, as should be done under a correct interpretation of the expression "Average length of school term." The result might more properly be called "Average length of attendance," which is essentially what it is desired to know.

A method which has been in use in some States for finding the average school term. of a county, for instance, is to weight the different school terms of the towns or districts the county is composed of by the number of schools in each. In other words, the total number of days (or months) all the schools of a county were kept is divided by the total number of schools to get the average time each one was kept. So, in finding the average term for the State, the school is taken as the unit instead of the pupil. When the schools differ much in size (number of pupils), as they do in all mixed urban and rural systems, varying from some half a dozen to 500 or more pupils each, the average term obtained by this method varies considerably from that obtained by the Bureau's method. The long terms of the large city schools not being given their proper weight, the resulting average is too small. The same objection applies still more forcibly to weighting the school terms of the different counties or towns by the number of school districts in each.

Still another method is to add together the school terms of the different counties or towns and divide by the number of such counties or towns; i. e., the simple arithmetical mean is taken. An example of this occurs in a school report, where it is stated that 14,193 pupils attended 185 days and 856 other pupils attended 160 days, while the average time the whole 15,049 pupils attended is computed at 172½ days. although nearly all (16 out of every 17) attended 185 days. This method, if it can be so called, gives altogether too short an average term, and nothing can be said in defense of it. It is as if, wishing to get the population per square mile of Minnesota and Dakota combined, we said, Minnesota, 9.86; Dakota, 0.92; average number of persons per square mile in the combined territory $(0.92+9.86)\div 2=5.39$, instead of dividing the total population of the two States by the combined area in square miles.

The "aggregate number of days' attendance" is a statistical item of the utmost simplicity and of great value, about the meaning of which there can be little or no difference of opinion. Every teacher's register that records the number of pupils present each day in any school, as they all presumably do, contains the data for ascertaining it for that school for the school year by the simple process of addition or summing up.

TABLE 9.—(*1*) *Length of school term.* (*2*) *The aggregate number of days' schooling given compared with the school population.*

Year.	Average length of school term, in days.						Average number of days' schooling given for every child 5 to 18 years of age.

g 1893-94.

Average salaries.—In computing (for Table 12) the average monthly wages of all the male (or female) teachers in a group of States, the average wages of each of the States in question is multiplied by the corresponding number of teachers. The sum of the resulting products is then divided by the sum of the teachers, and the quotient is the average wages of all. Each rate of wages thus receives its due weight.

To illustrate the principle: If 48 teachers receive an average of $72.20 per month, they all receive in a month $3,466; if 473 other teachers receive an average of $48.60 per month, these together receive in a month $22,988; all the 521 teachers combined therefore receive per month $26,454, or an average of $50.77.

Attention is called to this matter for the reason that the practice of taking the arithmetical mean of a number of rates of wages (the mean is $60.40 in the above case) in order to get the average of all is so common as to vitiate, to a considerable extent, the published statistics of average wages.

a In 1895–96.
b Approximately.
c State appropriation for colored schools.
d Includes money appropriated from the Federal Treasury.
e Not reported.
f Report incomplete.
g Income of county funds only. The income of State funds is included in column 3.
h Includes proceeds of bond sales.

TABLE 15.—*The school revenue analyzed.*

State or Territory.	Average amount raised per taxpayer (i.e., adult males).					Amount raised for each child 5 to 18 years of age.	Amount required from each adult male to provide $1 for each child 5 to 18 years of age.	Per cent of the whole revenue derived from—			
	From permanent funds and rents.	From State taxes.	From local taxes.	From all other sources.	Total amount raised per taxpayer.			Permanent funds and rents.	State taxes.	Local taxes.	Other sources.

a From 1871 to 1887 this Bureau did not ask principals of private high schools and academies to report the number of students pursuing each secondary study. Prior to 1887 the number of students reported by a large number of these private schools included the total number in attendance, the elementary pupils as well as the secondary students. For the past six years the two classes of students have been reported separately. Taking the reports from 1890 to 1895 as a basis, the number of secondary students in private high schools from 1871 to 1889 has been carefully estimated for each year.

b Previous to 1890 only the pupils in public city high schools are given. From 1890 onward all public high schools are included.

[1] Prepared by Miss Anna Tolman Smith.

TOPICAL OUTLINE.—Brief conspectus of the educational system of England—Educational statistics—Legislation of 1897 and survey of antecedent laws—Education in London.

Brief conspectus of the English system.—Elementary education alone has been organized into a system which is maintained by the combined effort of State and local authorities.

The action of the State is limited to securing through local agencies adequate provision for the instruction of all children. An annual grant is made by Parliament, $21,174,735 in 1896, which is distributed to the managers of schools, public and private, that fulfill specified conditions. These pertain to the equipment and staffing of the school, the duration of the annual session, the course of study, and the results of instruction. A grant in lieu of fees is also made for schools remitting the same, amounting in 1896 to $10,689,668. This sum with the grant above named makes a total of $31,864,403, or 64 per cent of the entire school expenditure from the public treasury.

A committee of council (education department) is charged with the distribution of the grant and maintains a force of inspectors, who must make an inspection of every school twice a year and report as to its efficiency, equipment, etc. The report of the inspector determines the amount of the grant to which the school is entitled.

The local school authorities are elective school boards or private managers, and the schools are characterized as board or voluntary, according to the management. Board schools are maintained in part by local taxes, yielding $10,627,422 in 1896. Private schools have no claim upon these, but draw a portion of their support from endowments and subscriptions. Fees may be charged in either class of schools, but have been generally remitted since the passage of the law of 1890, providing for the additional grant. Board schools must be nonsectarian, and private schools, even if parochial, are restrained by a "conscience clause" in the education law of 1870 from forcing religious instruction upon pupils.

School districts must enact compulsory by-laws applicable to all children between the ages of 5 and 14 unless they have obtained the educational certificate which alone entitles them to exemption. The age for exemption can not be less than 11 years, and under the by-laws of many districts exceeds that limit.

The teaching staff of a school comprises certificated teachers, assistants on probation, and pupil teachers. The last named are regarded as teachers in training, and an additional grant is made to the school on their account.

Teachers' training colleges established by private managers also receive appropriations from the State.

The system of education in Scotland, based upon the law of 1872, presents substantially the same features as that of England; i. e., it is a State-aided system in which local authorities have large liberty of action.

The Irish system, although differing materially from those of England and Scotland in respect to the nature and the relations of the central and local authorities, is maintained also by the combined action of the two.

The current statistics of education in the United Kingdom are here presented, followed by a comparative view of the principal statistics of elementary education for England and Scotland.

LEGISLATION OF 1897.

The Commissioner's report for 1895–96 contained a full account of the English education bill introduced into the House of Commons by Sir John Gorst, vice-president of the education department, April, 1896. The bill was intended to provide additional support from public funds for elementary schools and to reorganize the local administration of the schools. The measure was the outcome of promises of additional aid to parochial (voluntary) schools made during the campaign of 1895 by the leaders of the Conservative party, but, although supported at the outset by an immense majority, it collapsed in the second week of the committee debate on the proposals respecting local administration. In withdrawing the bill Mr. Balfour, the leader of the House of Commons, intimated that its consideration would be resumed in January, 1897. It was, however, generally understood that this particular measure was abandoned, and such proved to be the case. Since the promises that had been made to the managers of parochial schools could not be ignored, a new bill was presented by Mr. Balfour in February, 1897, the scope of which is set forth in the following resolution:

That it is expedient (*a*) to authorize the payment out of moneys to be provided by Parliament of an aid grant to voluntary schools not exceeding 5 shillings per scholar for the whole number of scholars in those schools; (*b*) to repeal, as regards day schools, so much of section 19 of the elementary education act, 1876, as imposes a limit on the Parliamentary grant to elementary schools in England and Wales, and (*c*) to make provision for the exemption from rates of voluntary schools.

Introduced as a money bill, precedence was given to this measure over other matters, and it was pushed rapidly through the three readings in the House of Commons and the committee stage, and was finally passed by both Houses April 5 and received royal sanction a few days later.

The text of the law is as follows:

AID GRANT TO VOLUNTARY ELEMENTARY SCHOOLS.

1. (1) For aiding voluntary schools there shall be annually paid, out of moneys provided by Parliament, an aid grant not exceeding in the aggregate 5 shillings per scholar for the whole number of scholars in those schools.

(2) The aid grant shall be distributed by the education department to such voluntary schools and in such manner and amounts as the department think best for the purpose of helping necessitous schools and increasing their efficiency, due regard being had to the maintenance of voluntary subscriptions.

(3) If associations of schools are constituted in such manner, in such areas, and with such governing bodies representative of the managers as are approved by the education department, there shall be allotted to each association while so approved—

(*a*) A share of the aid grant to be computed according to the number of scholars in the schools of the association at the rate of 5 shillings per scholar, or, if the

department fix different rates for town and country schools, respectively (which they are hereby empowered to do), then at those rates; and

(*b*) A corresponding share of any sum which may be available out of the aid grant after distribution has been made to unassociated schools.

(4) The share so allotted to each such association shall be distributed as aforesaid by the education department, after consulting the governing body of the association, and in accordance with any scheme prepared by that body which the department for the time being approve.

(5) The education department may exclude a school from any share of the aid grant which it might otherwise receive if, in the opinion of the department, it unreasonably refuses or fails to join such an association, but the refusal or failure shall not be deemed unreasonable if the majority of the schools in the association belong to a religious denomination to which the school in question does not itself belong.

(6) The education department may require, as a condition of a school receiving a share of the aid grant, that the accounts of the receipts and expenditures of the school shall be annually audited, in accordance with the regulations of the department.

(7) The decision of the education department upon any question relating to the distribution or allotment of the aid grant, including the question whether an association is or is not in conformity with this act, and whether a school is a town or a country school, shall be final.

REPEAL OF 17S. 6D. LIMIT RESPECTING DAY SCHOOLS IN ENGLAND AND WALES.

2. After the last day of March, 1897, the following words in section 19 of the elementary education act, 1876, namely, "Such grant shall not in any year be reduced by reason of its excess above the income of the school, if the grant do not exceed the amount of 17s. 6d. per child in average attendance at the school during that year, but shall not exceed that amount per child, except by the same sum by which the income of the school derived from voluntary contributions, rates, school fees, endowments, or any source whatever other than the Parliamentary grant, exceeds the same amount per child, and" shall be repealed so far as they apply to day schools in England and Wales.

EXEMPTION FROM RATES OF VOLUNTARY ELEMENTARY SCHOOLS.

3. No person shall be assessed or rated to or for any local rate in respect of any land or buildings used exclusively or mainly for the purposes of the schoolrooms, offices, or playground of a voluntary school except to the extent of any profit derived by the managers of the school from the letting thereof.

DEFINITIONS.

4. In this act, unless the context otherwise requires—

The expression "voluntary school" means a public elementary day school not provided by a school board.

Any reference to the number of scholars in schools means the number of scholars in average attendance, as computed by the education department.

The expression "local rate" means a rate the proceeds of which are applicable to public local purposes and which is leviable on the basis of an assessment in respect of the yearly value of property and includes any sum which, though obtained in the first instance by a precept, certificate, or other instrument requiring payment from some authority or officer, is or can be ultimately raised out of a local rate, as before defined.

Other expressions have the same meaning as in the elementary education acts, 1837 to 1893.

EXTENT OF ACT AND SHORT TITLE.

5. (1) This act shall not extend to Scotland or Ireland.
(2) This act may be cited as the "voluntary schools act, 1897."

The sum placed at the disposal of parochial schools by this law amounts for the current year to $3,050,000. The measure was opposed by the Liberal party on the ground principally that it provided for sectarian endowment. It was further urged that the relief it offered was entirely inadequate to the needs it was intended to meet. Moreover, the new administrative agency created by clause 3, section 1, providing for the federation of schools, was regarded as especially obnoxious. The Liberals were not alone in their objections to these features, which were criticized by many Conservative members who, however, voted for the measures.

The following citations from speeches made in Parliament or on the public platform during the debate emphasize these points.

Upon the inadequacy of the relief provided, Mr. Yoxall, who represents the interests of elementary education in Parliament, spoke as follows:

With the State aid grant, according to the vice-president, the committee of council are to bring about certain reforms in the management of schools. He hoped the vice-president would be able to do all he proposed to do, but the ideas of the right honorable gentleman were not embodied in the bill. Unless they were so embodied there was no security whatever that those admirable ideas would be carried out. But even if they were placed in the bill in the shape of specific amendments, and if it were determined to spend the money upon the purposes indicated, the money was entirely inadequate. To take the first thing referred to by the vice-president, the single-handed schools alone would require some £300,000 out of the £600,000. One-half of the money would go on that provision alone. Next they were told that the money was to be used in giving better salaries to the wretchedly paid teachers in the voluntary schools. The whole grant would not suffice to do that. The Government were going to give as a whole 5 shillings per child, but the deficiency between the board school and the voluntary school was 12 shillings per child, and of that 9 shillings per child came out of the pockets of the voluntary school teachers. How, therefore, the purposes of the vice-president were going to be defrayed out of a grant of 5 shillings per child he entirely failed to see. There was nothing in the bill or in the speech of the vice-president which would prevent the money from being spent more and more upon rates, taxes, fuel, lighting, and cleaning. The only way to prevent the leakage of the money voted by Parliament to noneducational purposes was to give some direct popular representation of the management of the schools. That need not interfere with the denominational character of the schools. It was also the only way to prevent the dismissal of teachers for all sorts of reasons other than legitimate reasons. As to these associations, he feared that unless express provisions were inserted in the bill to prevent it, a large part of the money voted would go to defray the organizing expenses of the associations.

In reply to Mr. Balfour's exclamation that this was quite impossible under the bill, Mr. Yoxall continued:

Last year the London diocesan board distributed £2,265 ($11,325) among poor schools, but the expenses, including the inspection of the schools in religious knowledge, were £1,384 ($6,920). He hoped that safeguarding clauses would be inserted in committee.

As to the association of schools provided for in clause 3, Mr. Jebb, who favored the bill, gave the following indorsement:

The cardinal feature [he said] of the machinery of the bill was, of course, the principle of association for the voluntary schools. It appeared to him it was not adequately recognized by honorable gentlemen opposite that some such grouping of voluntary schools was a matter of necessity for the purpose of distributing the grant. There were in England and Wales upward of 14,000 voluntary schools, and the grant was to be distributed according to the needs of the schools. It would be impossible for the education department, dealing individually with upward of 14,000 schools, to discriminate between their relative needs.

For the purpose of comparison and discrimination the area of the whole country was too vast. It was evident there must be some limit to the areas. On the other hand, it was clearly right that the department should have a veto on the area, because if the area adopted were too small it would not fairly represent the average of the needs. In the case of the Church of England the obvious area was the diocese. It must not be overlooked that the education department had the control of the constitution of the governing body on the council of an association. For example, the department might insist that on the council of every diocesan association, or any other association of voluntary schools, there should be a certain representation of laymen, and he thought it was highly probable that the department would insist upon such representation. Honorable members had maintained that there should be representative popular control, but the bill did not touch the management of the individual schools; that was altogether beyond its scope. The bill took the existing managing bodies of voluntary schools and invited them to nominate representatives on the council of each association, and the definite public guarantee for the proper constitution of the council was the control exercised and the veto possessed by the education department. In his opinion the bill afforded a most effective guarantee against any misapplication of the money granted, and the associations themselves would necessarily be of great educational value in the districts to which they belonged, for they would bring together the managers of voluntary schools in common council and common action. By doing so they would necessarily stimulate a local interest in educational work. They would probably tend to keep up an average of local efficiency. (School Board Chronicle, February 20, 1897.)

This favorable view of the principle of federation was not generally held by the Liberals. The abuses and confusion to which it might give rise were emphasized by the Liberal leader, Sir William Harcourt, both in and out of the House.

In a speech opposing the bill he maintained that, so far from having a common object, the members of these associations would each have the sole object of getting as much of the money for himself as possible and allowing as little as possible to go to anyone else.

As to the revisory power reposed in the vice-president of the education department, he said:

To have an absolute power to remold this scheme is to encounter the ecclesiastics from a population of a million and to rejudge their acts, to redress their injustice, and to give to those who have not received what they ought to have had and to take away from those who have got what they ought not to have had.

* * * * * * *

I would really ask, Is this a practical question?

* * * * * * *

Applying to it ordinary intelligence and some experience of the questions, and the districts, and the habits of the people who will have to deal with this question, unless some very different explanation can be given than any yet offered, I must pronounce it to be the most preposterous and absurd scheme that was ever submitted to the judgment of the House of Commons.

The discriminating character of a special grant of this kind was emphasized by concrete illustrations in a speech by Sir William Harcourt before a public meeting which, as it throws many side lights on the peculiar complications of the "dual school" system, and also on the tactics employed in carrying the measure, is here cited in extenso.

Under this bill [said Mr. Harcourt] in Lancashire they will get about £114,000 ($570,000). What do you think London, which has about the same number of scholars, is to have? They are to get £42,000 ($210,000), just about one-third, because the money is to be given to voluntary schools. There are more voluntary schools in Lancashire, and few in London, and therefore Lancashire is to get £114,000 ($570,000) and London £42,000 ($210,000). I will tell you what London is entitled to for the board schools, as nearly as possible—£100,000 ($500,000). But do you think you are going to get it? All I can say is that if you do, your faith must be like a grain of mustard seed. Let us examine this bill. Take Lancashire, for instance. Lancashire is a very rich county, but the real truth is that in Lancashire more than anywhere else there is great difficulty in getting subscriptions to the voluntary schools. There is much less sacrifice made there than in many parts of the country—much less sacrifice than is made in the southern counties that are so much poorer, and where board schools are supported by the rates—and yet you are going to assist the one and not assist the other. Let me say this more about the bill. You can hardly call this a bill at all. When you come to look at it, nothing is defined. No conditions are laid down in any proper or adequate way as to the security of dealing with this money. Instead of calling it a bill I should call it a head for a bill for sectarian endowments. Now, that is the first principle that we contend for, namely, equality of treatment for the board schools and the voluntary schools. That is refused. We hear much about the intolerable strain upon voluntary schools. Is there no intolerable strain on the rate payers? They say that voluntary schools are about to be starved out of existence. But voluntary schools have gone on growing and growing. What their friends are jealous of and can not bear is that the national popular schools—the board schools—grow also. When the board schools were established—and I had the satisfaction of taking a principal part in establishing the principle of board schools—they were introduced to make up the deficiencies of voluntary effort; but so great were the deficiencies of voluntary effort that the board schools have been compelled to fill up nearly half of the vacuum, and they are therefore entitled to at least as much consideration to fair treatment as the voluntary schools. Now, let me go to the next principle for which we contend. We have never denied that aid should be given to the voluntary schools, because our object is to get good education, and in many of the voluntary schools, and in some of the board schools, too, the education is not as good as it ought to be, because they can not afford adequate teaching staffs.

Therefore, so long as you deal fairly toward both classes of schools, we are not opposed to giving assistance to voluntary schools as well as to board schools. That must be clearly understood. What we say is this: If you are going to give this vast sum of money, let it be given on fair conditions in the application of that money, whether it is to board schools or to voluntary schools. In this country there are a number of schools that have no voluntary contributions at all. What an abuse of terms that is to claim special privileges for them when there is no voluntary contribution and they are entirely sustained by public money or by the

fees they exact from the children. There is another very important thing. There are 8,000 schools in this country where nonconformists have no access except to denominational schools. Now, what ought to be the case if you are going to give still larger sums of money to these voluntary schools? What we have asked and what we have contended for is that, as a complement to this new grant, there shall be popular representation. That is the next fundamental principle for which we contend. Is that a sound principle? I will read you a passage which expresses my view on that subject:

"The existence of sectarian schools supported by a State grant is, no doubt, a very serious question, and one which some day or another ought to receive consideration.

"Well, that day has arrived.

"Whenever the time comes for this discussion, I for one shall not hesitate to express my opinion that contributions of Government money, whether great or small, ought in all cases to be accompanied by some form of representative control. To my mind the spectacle of a so-called national school turned into a private preserve for a clerical minority and used for exclusive purposes of politics or religion is one which ought not to be tolerated."

That is a doctrine admirably expressed. It is from Mr. Chamberlain, one of the responsible authors of this present bill.

That was the important principle for which we were contending. We were only allowed one night's debate upon it, but it was a very remarkable debate, because in that debate man after man rose from the Government side of the House and implored the Government to act upon this principle to admit popular representation—not an overwhelming representation, which would have destroyed the denominational character of the schools. It was a most deplorable scene. I have had a pretty long Parliamentary experience, but I have never yet seen a great Government with a great majority obliged, in the very earliest stages of the principal bill of their session, to coerce their own followers by a threat of resignation. (School Board Chronicle, March 13, 1897.)

The progress of federation as provided for in the third clause of the law has been rapid, and the character of the governing bodies already formed seems to justify the demand that the law should provide explicitly for a certain proportion of professional experts in each of the governing bodies, to avoid the dangers of the extreme clerical tendency. The Church of England schools are being formed into associations, generally on the basis of the diocese all over the country, but very few teachers are admitted to the management. The Wesleyans alone seem inclined to give fair representation to those directly engaged in the work of the schools.

Immediately upon the passage of the bill in aid of denominational schools, Sir John Gorst moved a resolution for bringing in a bill in the interest of board schools in poor districts. The bill, which was admitted and passed without delay, increases slightly the grant to the class of schools named, appropriating for this purpose the small amount of $553,010. The discrepancy between the two measures of relief was tersely summed up by Mr. Acland, as follows:

The voluntary schools, educating indifferently two and a half millions of children, receive under the first law over £600,000 ($3,000,000). The board schools, educating more efficiently some two millions, are under the second measure to have only £110,000 ($550,000).

These two laws establish a precedent for special legislation which has heretofore been excluded from the system of elementary education.

A brief summary of previous legislation may serve to show more clearly the general bearing of these recent measures. The law of 1870, the foundation of the system, was also the first by which legal provision was made for the education of the whole people. Hitherto the elementary schools had been purely private ventures of the most desultory sort or the creations of religious societies. The Government had, however, manifested interest in the cause as early as 1833 by the grant of $100,000, to be distributed through the British and Foreign School Society and the National Society. In 1839 a committee of council on education was appointed to superintend the distribution, and the annual appropriation was increased to $150,000. The development of the system is signally illustrated by the fact that the Education Department distributed above $30,000,000 the present year.

The principal features of the law of 1870 were (1) the obligation assumed by the Government to secure school provision for all children of ages 5 to 14; (2) the recognition or creation of local agencies (private or church managers or elected boards) for the execution of this purpose; (3) provision for securing efficient instruction by means of an annual grant from the treasury to be distributed to the local managers upon the results of examination and inspection by Government inspectors; (4) the creation of a central agency to carry out the provisions on the part of the Government and of new local agencies, school boards, which every school district must elect except upon satisfactory evidence that schools efficient and adequate to the needs of the district were otherwise provided; (5) the admission of private and public elementary schools to a share in the Government grant upon the same conditions; (6) the requirements that board schools should be strictly nonsectarian and the children of private schools protected from enforced sectarian instruction by a conscience clause.

Under the provisions of this law 5,467 board schools have been created since 1870, with accommodation for 2,455,289 pupils, and the number of private (voluntary) schools increased from 8,798 to 14,479, with accommodation for 3,643,380 pupils.

In 1871, the year after the passage of the education law, the education department issued a code or body of regulations stating precisely the conditions upon which a school might share in the Government grant; a similar code has been since issued yearly. As these codes must be approved by Parliament, they have the binding force of law, and may therefore be included in this review.

The law of 1876 provided additional means for securing school attendance. To this end it established school attendance committees in districts having no school boards, forbade the employment of children under 14 years of age without proof of certain attainments, and

made it the legal obligation of parents to secure the instruction of their children in the elementary subjects. In 1896 the population under school attendance committees was 9,127,566, and under school boards, 19,874,959.

The law of 1880 went still further in the direction of compulsory education. By this, local educational authorities were required to make by-laws compelling parents to send their children to school. The law of 1891, providing an extra grant in lieu of fees for all schools remitting the same, completed the measures for securing universal school attendance. In 1893 the age at which a child may obtain total or partial exemption from school attendance, provided he has secured the educational certificate required by the local by-laws, was raised to 11 years. These direct efforts for enforcing and prolonging school attendance have been accompanied by changes in the code designed to increase both the attractiveness and the efficiency of the schools. The codes of 1875 and 1880 greatly extended the list of optional subjects for which grants could be claimed, and thus laid the foundations for the higher grade schools, which have become such an important factor in the progress of the larger cities and towns of England. The code of 1882 made the first break in the system of payment upon results. Individual examination in the elementary subjects was still maintained. For these alone a teacher could secure from the grant rates varying from 13 to 16 shillings per capita of the children who passed. Liberal grants were offered also for attainments in the higher subjects. The most important feature introduced by the new regulations was the "merit grant." This was to be awarded at rates varying from 1 to 3 shillings per capita of average attendance, according to the report of the inspector as to the general conditions of the school—i. e., whether excellent, good, or fair. Inspectors were instructed, in making up the report, to consider the special difficulties of the teachers, the general intelligence of the district, etc.

In 1895 the system of annual examinations was radically changed. Heretofore the inspectors had made a rigid annual examination of every school on the Government list. From this ordeal schools that had reached a certain standard were now excused. In place of the formal examination there were substituted two annual visits from the inspector, the visits to be made without notice. The inspector is to test the instruction and the general condition of the school, and from the notes taken at the time to make up his report of the school. If the report is satisfactory, the school will be entitled to the full grant.

If further evidence be wanting of the advance in the ideal of popular education, it is found in the improved regulations respecting evening schools. In 1890 it was first determined that these schools should no longer be purely or chiefly elementary in their scope, and in 1893 their character as "evening continuation schools" was distinctly outlined. The code of that year offered a wide choice of subjects adapted to the

various needs of scholars and districts, and enabled managers to combine instruction in subjects for which grants are paid by the State with instruction in other subjects for which no such grants are paid, but which it may be for special reasons desirable to include in the curriculum. It suggested, further, a variety of courses of instruction; recognized the attendance of persons over 21 years of age; sanctioned the payment of grants for the instruction of the school as a whole instead of for the attainments of individual scholars, and made other important changes in the methods of awarding the Government grants to these schools.

The effect of this policy may be inferred from the increased attendance. In 1889 less than 65,000 students availed themselves of the provision; in 1896 the number was 298,724. In 1892, the year before payments were first allowed for students above 21 years of age, only 6,617 above that limit were enrolled; in four years the number has risen to 35,815.

This brief survey justifies the belief that the law of 1897, for the relief of voluntary schools, and the law increasing grants to the poorer school boards were primarily intended to increase the efficiency of schools that form an important part of the general system. The need of such improvement was recognized alike by Liberals and Conservatives, but as to the proper means of its accomplishment there were, as we have seen, grave and bitter differences.

The system here considered pertains to England and Wales only. Scotland secured a general education law in 1872, which conserved the best features of the famous parish school system and differed from the English law in particulars that show the prevalence in Scotland in the early seventies of a higher ideal of popular education and a general preference for public schools. The Scotch law distinctly recognized higher grade schools and made the election of school boards mandatory for every district. The matter of religious instruction was left to the boards, excepting that no child could be constrained to attend upon religious instruction.

A Parliamentary grant was allowed as in England, and its provision intrusted to a committee of council (education department, Scotland) upon like conditions as in England, and under a similar system of inspection. The reciprocal action of the two systems has been advantageous to both. The growth in the English ideal has undoubtedly been stimulated by that of Scotland. On the other hand, the necessity of securing every step by legislative action in the southern division of the Kingdom has increased in Scotland activity in the same direction. The gap between elementary schools and higher institutions, which forms at this moment a serious obstacle to the best development of the English system, has never existed in Scotland. On the contrary, technical education is more liberally fostered and better organized in England than in Scotland.

ELEMENTARY EDUCATION IN LONDON.

Population and school provision.—The magnitude of the educational work of London is indicated by the population, which in 1896 numbered 6,177,913, exceeding that of any one of the United States, New York alone excepted. If inner or registration London only be included, the population was 4,421,492, which is exceeded by two of the United States, viz, New York and Pennsylvania. This vast aggregate of people represented a school population of 832,966, comprising the children between 3 and 13 years of age. The estimate is made on the basis of six-sevenths of the total population, one-seventh being excluded as the class whose children will not be sent to the elementary schools. School accommodation is provided for 754,614 children in schools recognized as "efficient;" that is, entitled to Government aid. These are either voluntary (chiefly parochial schools), which provide 34 per cent of the total number of places, or board schools, that supply 66 per cent. Since the election of the first school board in 1870, immediately after the passage of the elementary school law, the school population has increased by 45 per cent. At that time there were places in voluntary schools for 261,158, less than one-half the population of school age.

The relative status of the two classes of schools with respect to accommodation and attendance in 1896 and the growth from 1870 to that year are shown in the following tabulation:

	Christmas, 1871.	Lady day, 1896.	Increase or decrease.	Per cent of increase.
Number of children of the elementary school class between the ages of 3 and 13	574,693	832,966	258,273	45
Accommodation in efficient schools:				
Board schools	.....	497,751	497,751	.....
Nonboard schools	262,259	256,863	a5,396	.....
Total	262,259	754,614	492,355	187.7
Average number on roll of efficient schools:				
Board schools	.....	511,506	511,506	.....
Nonboard schools	222,518	227,364	4,846	.....
Total	222,518	738,930	516,412	232
Average attendance at efficient schools:				
Board schools	.....	415,471	415,771	.....
Nonboard schools	174,301	178,902	4,601	.....
Total	174,301	594,373	420,372	241

a Decrease.

Of the total enrollment for 1896, 703,371 children were between the ages of 3 and 13 and 40,336 were above 13. The sex of children in infant schools (number, 261,326) is not reported. Of the older children, 239,274 were boys and 238,330 were girls.

The foregoing statistics indicate in a measure the work achieved by the school board in twenty-six years in the mere matter of providing

schools. At the end of 1896 the board had 402 schools open and 153 in process of construction. The selection and purchase of sites has been one of the most difficult tasks imposed upon the board and explains in part the charges of extravagance by which it is hampered.

Although immense progress has been made in overcoming the school deficiency that existed in 1870, the supply of school places is still nearly 80,000 below the number of school children. As, however, will appear from further statements, a part of this deficiency is counterbalanced by the children unable to attend school.

General character of voluntary schools.—The voluntary schools are chiefly parochial, but some few are under private management, as, for instance, the Jews' free school, probably the largest school in the world, maintained by Baron de Rothschild. This school, situated in the midst of the district where the poorer Jewish immigrants congregate, has accommodation for 2,250 boys and 1,250 girls. It is one of the most efficient schools in London, as shown by the large annual grant which it secures upon the results of the Government examination. Besides tuition, breakfasts are provided every morning and each child is given a suit of clothes and two pairs of shoes yearly. A savings bank is connected with the school which pays the pupils 10 per cent on small deposits.

Beyond the statistics already given, official information respecting the voluntary schools is seldom attainable. The further statements in this chapter relate to the schools under the school board.

Constitution and powers of the school board.—This body is elected by all the rate payers (women included) for a term of three years. It comprises 55 members, organized in ten or eleven standing committees, and employing a permanent staff of about 450 officers and clerks. Besides the salaried officers, there are local managers, to whom the board delegates certain supervisory functions. These local managers, numbering about 2,000, are appointed upon the nomination of the divisional committees. They usually retain office, if they will, as long as they make a minimum number of visits to the schools. As a rule, three schools are placed under one group of managers. The local managers nominate the assistant teachers, and also take part in the selection and nomination of the head teachers.

Within the restrictions of the education law (1870, and subsequent amendments), which limits the powers of the school boards simply in respect to the conditions as to equipment, attendance, and efficiency required for participation in the parliamentary grant, the board has absolute authority with respect to the schools. It chooses and purchases sites, appoints teachers, and determines their qualifications and salaries, and may claim or levy taxes (rates on the taxable property) to meet the current expenses in excess of the amount derived from the annual grants or other sources of permanent income.

The responsibility of the board is not limited simply to the care of the

company with thieves are sent—one at Brentford, for 100 boys, and the other, the Shaftesbury industrial training ship, for 500 boys. There are also two truant schools and a day industrial school. A house has recently been acquired for a girls' industrial school.

The board has also secured 1,005 places (870 for boys and 135 for girls) in voluntary industrial schools, of which there are 36, with accommodation for 8,333 children. There are also voluntary truant schools, with provision for 165 pupils. Altogether there are 9,638 places in industrial and truant schools for the special care of vicious or incorrigible children. The expenditure for these schools in 1896 reached $235,000.

Causes of irregular attendance.—Complaint is made that the efforts of the board to secure regular attendance are not adequately seconded by the magistrates, and in general that the means of dealing with truant children are unsatisfactory.

Under ordinary circumstances complete exemption from school attendance may not be granted for any child under 13 years of age, and in the case of children over 13 complete exemption can not be granted unless it is proved that the child has made 350 attendances annually during five of the six years immediately preceding. With all the efforts that are put forth it is admitted that "the degree of regularity of attendances at which the board aims has not yet been reached." Many causes in the metropolis militate against the attainment of a high percentage of average attendance. Of these the following are cited: The poverty of large masses of the population; the migratory character of the population; the stringency of the board's regulations with regard to infectious diseases; the lack of sufficient and proper facilities for prosecutions for nonattendance at school.

Classification of pupils by grade.—With respect to studies the classification of pupils in the board schools was as follows in 1896:

Grade.	Number.	Percentage of children in each grade exclusive of "below grade 1."
Below grade 1	151,344	
Grade 1	84,188	23.6
Grade 2	70,830	19.9
Grade 3	64,057	18
Grade 4	55,056	15.4
Grade 5	41,470	11.6
Grade 6	25,890	7.3
Grade 7	11,521	3.2
Ex. grade 7	3,724	1
Total (inclusive of those below grade 1)	508,080	

The obligatory studies and the standards of each grade are fixed by the education department, and are applicable to all schools under Government inspection. The obligatory subjects are reading, writing,

and arithmetic, with drawing for boys and needlework for girls; also object lessons in the three lower grades. In addition to these subjects the programmes include class subjects, one of which must be taken by the older pupils, and specific subjects. The latter would be counted high-school studies in this country. The reports do not give the precise number of pupils taking either the class or specific subjects, but the tabulated results of the examinations here presented indicate the number approximately.

Results of examinations in class subjects.

Department.	Number of cases in which—	
	2-shilling grant was earned.	1-shilling grant was earned.
Boys	890	9
Girls	845	15
Mixed	113	7
Total	1,848	31

Results of examinations in specific subjects.

Department.	Number of cases in which—	
	3-shilling grant was earned.	2-shilling grant was earned.
Boys	25,673	988
Girls	12,595	401
Mixed	1,853	113
Total	40,121	1,482

Extent of gratuitous provision.—The board has remitted all fees in the day schools and supplies school books, apparatus, and stationery free of charge to the pupils. Pianos are provided in the halls of 57 schools, to assist in the music drills given to children. There are scholars' lending libraries at every permanent school. Suitable books for children are lent free, to encourage a love of reading. Thrift is fostered by the establishment of penny banks at the schools.

The teaching corps.—The teaching staff of the board schools in the year under review had reached a total of 10,695, classified as follows:

Period.	Adult teachers.		Pupil teachers.	
	Masters.	Mistresses.	Boys.	Girls.
Year ended lady day, 1896	3,014	6,060	285	1,316
Increase over 1895	131	284	21	15

Expenditure for salaries was approximately £1,169,720 ($5,848,600), or 49 per cent of the total expenditure.

The average salaries of teachers were as follows in 1895:

Class.	Number.	Average salary.
Head masters	352	$1,643
Head mistresses	700	1,179
Assistant masters	2,294	741
Assistant mistresses	4,605	602

Evening schools.—Evening schools, opened first by the board in 1882, have been greatly developed under the new regulations issued by the education department in 1893.

In accordance with the new programmes the name is changed to evening continuation schools, which indicates the wider and freer scope of their work. Particulars of these schools and of other special departments of the board's work are included in the statement of the chairman of the finance committee quoted below.

Finances.—The expenditure by the board in 1896 reached the sum of $11,722,360, of which amount about 75 per cent was derived from the local tax. The adjustment of this tax is the most difficult of all the responsibilities resting upon the board, and is the point against which the advocates of parochial schools direct their criticism with most telling effect. During the year under review the cries of extravagance were specially pronounced, and had much to do in bringing about the clause in the defeated education bill providing for a veto on school-board expenditure by some external authority.

It is admitted even by those thoroughly in sympathy with the work of the board that the annual increase of expenditure calls for special attention.

The chairman of the finance committee in presenting estimates for the current year submitted an exhaustive analysis of the conditions of the problem, and while recognizing that items of new expenditure must continually arise, urged that the board should exercise greater control over the action of its standing committees. The statement as a whole is of importance only to the rate payers of London, but many particulars have a general interest because they disclose the workings of one of the chief school systems of the world.

The chairman stated that—

The estimates passed by the various committees, and approved by the board, for the year ended March 25, 1896, amounted to $11,364,810; the approximate expenditure amounted to $11,722,360, or an excess of expenditure over estimate of $357,550. With the accounts of so large a work as that of this board, items of new expenditure must of necessity arise from time to time. New work arises in various ways. Firstly, it is imposed upon the board by Parliament (this was the case when the board had to take over from the poor-law boards the care and the maintenance of the deaf and blind children; work such as this has to be undertaken whether the board like it or no). Secondly, the board itself occasionally seek new powers, as in the case of manual training and laundry classes, but in all cases that come under these two heads the liability on the board's finance can be foreseen and provided for. Thirdly, there is work arising from an outbreak of an

epidemic, etc., or a defect or failure in the sanitary arrangements. This class is practically the only one that entails work that must be proceeded with so soon as the necessity is demonstrated, and yet which could not have been foreseen. Fourthly, there is another class of new expenditure which is almost invariably extensive and costly in character; i. e., the alteration of internal fittings to schools, the supply of a more elaborate apparatus, and new methods of organizing the schools. This class of expenditure, however, is completely under the control of the committees in charge of the work, and should never be commenced until the board have had an opportunity of providing the necessary funds. When I come to examine into the cause of this overexpenditure of $357,550, I find that no excess upon estimate has arisen under the first three heads, but that the excess is mainly due to the last class of expenditure; i. e., expenditure over which the committees have full power of control, both as regards time of execution and amount of work to be executed.

The gross cost per capita of average attendance for the successive years 1893 to 1896 was shown to be as follows:

Year.	Gross cost per child.	Year.	Gross cost per child.
1893	$17.83	1895	$18.60
1894	18.00	1896	19.54

These rates are below the average of our own cities, in which the per capita ranges generally from $20 to $35.

The following tabulation shows the total expenditure for the same years and the steady increase during the period:

Year.	Total expenditure.	Increase over previous year.	Year.	Total expenditure.	Increase over previous year.
1893	$9,843,560	$480,970	1895	$10,803,790	$635,975
1894	10,167,815	324,255	1896	11,722,360	918,570

The yearly increase in expenditure brings an increased levy on the local taxes, which, for the year ending March 25, 1897, it was estimated must furnish £1,800,926 ($9,004,630), equivalent to a tax of 12.31 pence in the pound[1] (equivalent to 5 cents on a dollar). This was an increase of 0.82 pence over the rate of the previous year, and is the highest assessment yet reached.

[1] The London rate, which, as shown above, is about a shilling in the pound, exceeds the average rate for the country by about three half pence in the pound. From a statement in the Schoolmaster for September 4, 1897, it appears that in 20 per cent of the English boroughs, in 17 per cent of the English parishes, in 8.7 per cent of the Welsh boroughs, and in 23.4 per cent of the Welsh parishes the school board rate amounts to a shilling or above, the actual number of boards falling into the list being 440. Out of the 56 county boroughs 2 reach the London rate, viz, Coventry and York, and 13 exceed it. Among the latter are included Birmingham, Leeds, Leicester, Norwich, Nottingham, and Sheffield. Nineteen municipal boroughs also exceed the London rate.

The detailed statement of expenditure given below shows precisely what is comprised in the totals above presented.

Day schools.	Approximate expenditure.
School management committee:	
1. Salaries of teachers	$5,848,600
2. Instruction of pupil teachers	63,525
3. Books and stationery	322,605
4. Cookery, laundry, manual work, salaries of officers, and sundries	447,360
Works committee:	
5. Repairs to buildings and furniture	497,920
6. Wages of school keepers	289,280
7. Fuel, light, and water	196,350
Finance committee:	
8. Rates, rents, etc	470,185
9. Evening continuation schools	218,130
General:	
10. School buildings, etc., not chargeable to loan account	231,000
11. Enforcement of compulsion	237,700
12. Industrial schools	235,440
13. Office expenses	224,050
14. Interest on and repayment of loans	2,427,270
15. Legal expenses	6,860
16. Stamps and charges on loans	4,035
Total	11,722,360

In his estimates for the year 1896–97 the chairman shows an increase of $325,000 for teachers' salaries, which includes $100,000 for teachers in new schools, $25,000 for unattached teachers and special teachers for French, and "hand and eye" training in higher grade schools.

Other special items are thus explained by the chairman:

The training of the industrial faculties of students, including deaf and dumb, during the past year cost the board £62,546 ($312,730). As this work is increasing, the estimate of £58,700 ($293,500) of last year has been increased to £76,000 ($380,000) for the current financial year. This amount is undoubtedly getting very large, but I venture to think there is no expenditure of the board that will be more willingly borne by the rate payers than this burden which, as much as any other portion of the board's work, tends to increase the usefulness and value of the future citizens. I find that cookery instruction cost £19,000 ($95,000); that the laundry work cost £6,700 ($38,500), and that manual training cost £19,500 ($97,500). The cost of the schools for the special instruction of mentally defective children was £4,900 ($24,500). The instruction of the deaf, including the sum of £2,496 ($12,480) for maintenance of children taken over from the poor-law authorities, was £7,717 ($38,585); and the instruction of the blind, including the sum of £2,209 ($11,045) for boarding out 76 children, cost the rates £3,106 ($15,530). The cost of the maintenance of these children amounted to £4,705 ($23,525), and the contributions received from the parents toward the cost of maintenance of the children has amounted to £301 ($1,505).

I must again ask the board to bestow more than usual care upon the working of the act relating to these poor children, for, although the advantages to society, by enabling these otherwise helpless members of society to become helpful and useful members, must be very great and the money spent upon this object well laid out, the feeling of the perpetual responsibility for the proper care and maintenance of their offspring should be lessened as little as possible, and every care should be taken that, while not making the act unduly oppressive, contributions in accordance with the means of the parents should be insisted upon. The evening continuation schools have been making good progress during the past year, the

average attendance having increased from 13,976 to 15,761. This, however, must not be taken as indicating the number of students attending these classes, as a large number only attend on one evening in the week, which, consequently, only counts as one-third in average attendance. The books have not been fully made up, but when they are the number of students who have, for longer or shorter periods, made attendances at these classes will be found to be very little less than 50,000. The cost of these classes for the current financial year is estimated at £45,650 ($228,250), which will allow for a large increase in the average attendance.

As to the work of building necessary to keep pace with the ever-growing population the chairman says:

The additions in the shape of increased space now required, enlarged apparatus, and greater conveniences for each scholar over what was formerly the case must largely add to the cost per head. During the year tenders have been accepted for erecting 11 new schools and enlarging 17 others, and finished plans have been provided for 8 new schools and 9 other enlargements, besides a large number of cookery, laundry, manual training, housewifery centers, and schools for special instructions and the teaching of upper standards. I am glad, however, to see that the erection of iron buildings for temporary schools is on the decrease, as this is one of the most expensive items in connection with day schools.

It should be observed that the funds for the purchase of sites and the erection of buildings are borrowed by the board from the public works loan commissioners, in accordance with the provisions of the education law. During the year 1895–96 the sum of $3,000,000 was borrowed for this purpose, and the outstanding balance of the debt owed by the board on this account March 25, 1896, was $43,144,378.

PROVISION FOR SECONDARY AND TECHNICAL INSTRUCTION.

The foregoing statement, which relates wholly to elementary schools, conveys no idea of the provision that exists in London for continuing the education of the people into secondary and higher courses, excepting as these are represented in the class and specific subjects of the elementary programme. There are, however, numerous agencies, public and private, devoted to this purpose.

The most important of the public agencies is the technical education board. Under the technical education laws of 1889 and 1890 a local authority, such as the London County Council, may support manual instruction in schools and other institutions which are within its districts or in outside districts accessible to its students. The aid must not be given to schools conducted for private profit or for pupils in the elementary grade, hence its work is essentially public and of secondary or higher grade. The London County Council has delegated its powers in these respects to the technical education board.

The funds at the disposal of the board are applied in two ways: First, in providing scholarships; second, directly to institutions for laboratories, equipment, and special departments, or to meet the salaries of teachers of science, art, manual training, domestic economy, and commercial subjects in various schools.

The system of scholarships established by the board comprises the following:

(*a*) *Junior county scholarships.*—Commencing with children leaving public elementary schools after passing the sixth standard, the board has established a number of junior county scholarships, of which 600 are awarded every year. These scholarships include free education at certain secondary or higher-grade schools approved by the board, together with money payments in lieu of the wages which might otherwise be earned by the scholars, amounting during the first year to $40 and during the second year to $60, the scholarships being ordinarily tenable for two years.

* * * * * * *

Candidates must be under 13 years of age on the first day of the month in which the examination is held. They must have lived in London for at least one year previously to the award of the scholarship, and their parents or guardians must be in receipt of not more than $750 per annum, or, in the case of weekly wages, not more than $15 per week from all sources.

In 1895, the total number of candidates competing for the junior scholarships was 3,794 (2,337 boys, 1,457 girls); 1,829 passed, and 612 scholarships were awarded. The candidates came from 407 schools, of which 280 were board schools, 107 voluntary schools, and 20 secondary schools.

(*b*) The intermediate county scholarships established by the board are open to boys and girls under 16, who come from any school, secondary or upper standard. They give free education till the scholar is between 18 and 19, together with money payments rising from $100 to $175 a year, and are limited to candidates whose parents are in receipt of an income of not more than $2,000. They are tenable at public secondary schools or places of higher learning, and nearly all the leading schools of London, besides University College and Bedford College, have now some of the board's intermediate scholars in attendance. The board awarded 50 of these scholarships in 1894 and 70 in 1895.

(*c*) The senior county scholarships are intended to provide for a few specially promising students a training of university rank. Open as a rule only to persons under 19 years of age, they give free tuition at a college or technical institute, together with money payments of $300 a year, tenable for three years. The income limit for the parents is the same as for the intermediate county scholarships, viz, $2,000 a year. The board has hitherto awarded five of these scholarships a year, but in 1895 it awarded in addition seven "exhibitions" of varying values to candidates who were not successful in obtaining scholarships.

The board also offers each year a certain number of scholarships and prize funds in science and art to older candidates who have already entered into some industrial career as apprentices or skilled artisans. These include 20 scholarships of the annual value of $100 each, together with payment of tuition fees, tenable for two years. These scholarships are intended for students who will study in day schools of art.

Twenty artisan art scholarships, of the annual value of $100 each, together with payment of tuition fees, tenable for two years in the first instance but renewable for a third year. These scholarships are confined to those who are actually engaged in some trade requiring artistic handicraft.

One hundred prizes (exhibitions), of the value of $25 each, tenable for two years. These are intended to pay the traveling and incidental

expenses of students who wish to carry on their art studies in the evenings; also an equal number of prize funds of the same value, tenable in evening schools of science and technology.

In addition to the above scholarships, in 1895 the board awarded 314 scholarships in domestic economy, enabling girls to go through a five-months' course of training in cookery, dressmaking, and laundry work at the schools of domestic economy started by the board at several polytechnics and other centers. There are also awarded 12 training scholarships in domestic economy, tenable at the Battersea Polytechnic School of Domestic Economy for training teachers, and two horticultural scholarships, of the value of $300 a year for two years, tenable at the Swanley Horticultural College, Kent—one for men and one for women.

From the fourth annual report of the work covering the year 1895–96, it appears that the technical education board continues its policy of seeking to coordinate existing institutions and to increase their provision for technical education.

There are now no fewer than 98 separate institutions in London to a greater or less extent supported by the board and inspected by its officers.

Special attention has been paid to developing instruction for apprentices, improvers, and journeymen in the principal London industries. More than 200 well-equipped and efficient centers of practical instruction in various trades are now under the supervision of the board.

The character of the instruction given differs slightly, but, on the whole, it is of a kind that will assist industrial progress. As to instruction in electrical engineering, it is stated as a noteworthy fact that from 16 to 18 students from the Royal College of Science have been attending the evening classes for electrical engineers at the Southwest London Polytechnic Institute. This may be taken as good evidence of the polytechnic's efficiency.

London now has 11 polytechnic institutions, which have on their rolls probably not fewer than 40,000 separate members or students. Nearly all the polytechnics provide instruction in science, art, technology, commercial subjects, literary subjects, and domestic economy; and during the session 1895–96, before the Northampton Institute and the Northern Polytechnic were opened, the students registered at the London polytechnics, including the People's Palace and the Goldsmiths' Institute, in the several departments, were:

Science	8,371
Art	2,910
Technology	4,692
Domestic economy	2,678
Commercial subjects	8,244
Total	26,895

The 11 polytechnic institutes, according to the official report, may be estimated for the current session 1896–97 to be spending in all their departments a total of about $640,000 per annum, of which, roughly speaking, $145,000 will probably be provided by the city parochial trustees, $125,000 by the technical education board, $110,000 from city companies, $60,000 from private subscriptions and other endowments, $45,000 from Government grants, and $150,000 from students' fees, etc. The total capital expenditure can only be roughly guessed at, but it will certainly have exceeded $2,500,000. They may be expected to have in 1897–98 a total of about 45,000 separate students in all subjects, as compared with a corresponding total for 1892–93 of not more than 20,000.

The development of the higher departments at several of the polytechnics has during the last two or three years greatly increased the provision of higher instruction, especially in engineering, chemistry, and physics. In the new and well-equipped laboratories now provided at these institutions by means of the board's equipment grants, facilities are given for the student to pursue his work without a break from the elements of the subject up to the highest branches, and to undertake, in conjunction with his teacher, original investigation and research. A considerable addition has thus been made to the instruction of distinctly university rank now accessible to the London student, and it is estimated that, in addition to a large number preparing for matriculation, there are now over 100 matriculated students in the polytechnics who are definitely studying for London University degrees in science. This number constitutes no small proportion of the total of matriculated students for science degrees, other than those in the medical schools, who are studying in organized educational institutes in London.

This great development of instruction of university rank in new institutions has increased the importance of bringing about a more systematic coordination of university education in London. The board has accordingly continued to press for the early establishment of the promised new teaching university for London, toward the technical departments of which it is proposed the board should contribute. As a means of coordinating the different institutions providing university instruction in technical subjects, arrangements are in progress for courses of intercollegiate lectures, mainly in post-graduate and specialist subjects, which will be open to all students of the various institutions concerned.

Commenting upon the report, the London Globe says:

A special difficulty in the building trades is the indisposition of London employers to take boys into their service, either as apprentices or without any arrangements for their instruction. The inquiry made by the board in 1895 showed that 41 typical firms in various branches of the building trades, having 12,000 employees, had only 80 apprentices and 143 "learners," instead of 1,600, which would have been about the normal proportion. The London building trades are, in fact,

mainly recruited from the country. The result is not only that great difficulty is experienced by boys in obtaining situations where they can learn any branch of the building trade, but also that in the absence of the normal proportion of boys and young men the establishment of successful trade classes has been a specially onerous task. But the difficulties are now being overcome. The present session has seen a large increase in the number of students in building-trade subjects, there being over a thousand entries in building construction at the polytechnics alone, mainly by carpenters, joiners, bricklayers, masons, architects' assistants, and builders' clerks. The number of artisans attending classes in practical plane and solid geometry also shows an increase. There are now classes in building construction, architectural drawing, quantity surveying, and workshop drawing at 37 centers; in practical geometry and geometrical drawing at 40 centers, and in technical mensuration at 6 centers.

The influence of the board in promoting a high order of scientific training is shown particularly in the work of the polytechnics. According to a statement in Nature of June 10—

These institutions are moving toward a higher educational status than they occupied a few years ago. The courses of study are systematized, and they are supervised by teachers who have had laboratory experience, and hence they educate the mind as well as train the hand. An announcement that in the next session (1897-98) Principal Tomlinson, F. R. S., of the Southwest London Polytechnic, will establish a class for training in research affords an instance of the higher tendency of polytechnic instruction. This research training will form part of the curriculum of the second-year day electrical engineering students of the institute, but will be open to a limited number of other students, provided they can show a fair knowledge of the elementary principles of physics and mathematics. The method of conducting any research will be as follows: The principal will first select some subject for investigation suitable for electrical engineering students. He will then fully explain to the class the various reasons which have induced him to make the selection and will give a brief history of what has been previously done round and about the subject and full reference thereto. He will also propound a mode or modes of attacking the research and invite criticisms from the class. When the best mode of attack has been decided on, the class will be expected not only to take part in the experiments, but to help in preparing the required apparatus. Should the results obtained be of sufficient importance, they will be offered in the form of a paper to such societies as the Royal Society, the Physical Society, or the Institution of Electrical Engineers. From time to time during the investigations the principal will give demonstrations or lectures on those particular branches of magnetism and electricity which bear directly on the investigation and will illustrate them by the results obtained. The subject selected for the first research is "The effect of repeated heating on the magnetic permeability and electrical conductivity of iron and steel."

CHAPTER II.

EDUCATION IN FRANCE.[1]

France, Republic: Area, 204,092 square miles. Population (actual), April 12, 1891, 38,095,156; domiciled or legal, 38,343,193.

Civil divisions: For purposes of civil government, France is divided into 86 departments (90 if Algiers be included), each having its local legislative assembly formed by election. The departments are subdivided into arrondissements, and these into cantons. The smallest civil divisions comprised within the cantons are communes.

[1] Prepared by Miss Anna Tolman Smith.

CONSPECTUS OF THE STATE SYSTEM OF EDUCATION, OR UNIVERSITY OF FRANCE.

France has a highly centralized system of education under a cabinet officer, the minister of public instruction and fine arts.[1] It is organized in three departments (superior, secondary, and primary), each under its own director. The minister is assisted by the superior council of public instruction, composed of eminent representatives of the three orders of instruction, 60 in number, one-fourth appointed by the President of the Republic and the remainder chosen by their peers. This council is the deliberative head of the university system. In certain cases of discipline affecting professors and teachers its decisions are final. The administration of the system is facilitated by its division into academies, 17 in number, each of which comprises, under the general direction of a rector (appointed by the minister), all the public institutions, i. e., primary schools, lycées, colleges, and universities of the respective districts. The rector must be a university man, holding the doctor's degree. By recent decrees and the law of July 10, 1896, the former State faculties have been transformed into universities. The State continues to appoint all professors and university officials, to prescribe requirements for admission and for degree examinations, to regulate fees, and to confer diplomas. The authority of the university, exercised through a council consisting of the academic rector, the deans of the several faculties, and two professors elected from each faculty, extends only to the adjustment of programmes, the control of students, of the income from tuition fees, and of the university property. Fifteen universities have been constituted under the law. To the department of superior instruction belong also special schools; one of these, the superior normal school, is designed to prepare professors for the service of higher education.

The department of secondary instruction comprises the lycées or State classical colleges (in number 109) and communal colleges (227) maintained by the combined aid of the State and local authorities. The professors in both classes of schools are appointed by the minister from candidates possessed of the university diplomas. Their salaries are paid by the State.

The scholastic and domestic affairs of the lycées (they are both boarding and day schools) are controlled by the minister and superior council. They have a double course, classical and modern, the former leading to the bachelors' degree. The studies of the local colleges are conformed as far as possible to the lycée programme. The State maintains also lycées and colleges for girls and a special normal school (Sèvres) to prepare professors for the same. The 86 civil departments of France (90 if Algiers be included) form also districts of educational administration within the academies. In the chief city of each

[1] Present minister, M. Rambaud, who succeeded M. Combes April 29, 1896.

resides an official (inspecteur d'académie), charged under the orders of the rector with the supervision of secondary instruction.

The department of primary instruction includes maternal schools, elementary primary and superior primary schools, and departmental normal schools.

The law of 1833 laid the foundation of the system by imposing upon communes the obligation to establish public schools. Under the Republic the system has been developed through legislation, an efficient central supervision, and substantial appropriations from the Government.

By law of June 16, 1881, primary instruction is gratuitous, and teachers must be provided with State diplomas (brevets de capacité). By law of March 28, 1882, primary education is compulsory (attendance upon private schools or home instruction meets the requirement), and public primary schools purely secular. By law of October 30, 1886, the studies and organization of the several classes of schools are determined and only lay teachers admitted to the service. By laws of June 19, 1889, and July 25, 1893, the State assumes the payment of the legal salaries. Communes provide residences for teachers and supplement the salaries. The teachers are appointed by the departmental prefect from lists of candidates offered by the departmental councils. These councils are composed of members of the superior council and directors of primary schools. They exercise advisory, and in certain cases judicial, functions in respect to primary schools.

For the service of primary instruction there is a graded series of State inspectors appointed by the minister, comprising (1) general inspectors, assigned each to a particular section, inspectors of special branches, inspectresses of maternal schools; (2) the "inspecteurs d'académie," who conduct the examinations for teachers' diplomas and have the general direction of primary schools; (3) primary inspectors, about 450 in number, one for every 150 schools; (4) medical inspectors.

The communal authorities have the chief voice in the choice of sites, buildings, etc., the mayors of communes have free access to the schools at all times, and local committees are appointed to keep watch over the schools. The communes must provide a fund (caisse des écoles) for the aid of indigent pupils. Every department must maintain a primary normal school for men and one for women, unless authorized to combine the two. Among the special schools comprised in the department of superior instruction the State maintains two normal schools (Saint Cloud for men, Fontenay-aux-Roses for women) to prepare teachers for the departmental normals.

The authority of the minister of public instruction extends, in a measure, also to private institutions of all grades. He grants the privilege of conducting private schools, which must conform to official requirements in respect to sanitary and hygienic conditions.

These schools were included by Napoleon among faculties in the decree of 1808, organizing the university. The same necessity gave rise to schools of medicine. These, created by physicians or municipalities, were in time brought under the imperial control, and became equivalent to, or appendages of, the faculties of medicine. Even in the Paris faculties, which never lost entirely their esprit de corps, teaching functions were not revived until 1823, when the medical faculty was reorganized and increased by the addition of 36 special professors (agrégés), whose duty it was to impart systematic instruction to medical students. In 1838 the faculty of law declared that every professor in that body ought to give at least three lessons a week. In 1840 an effort was made, at the instigation of Cousin, to create a teaching service in the faculties of letters and of science.

The importance of the teaching service has been fully recognized under the Republic, but its development in the faculties of letters and of science has been slow, and until a very recent date has benefited only candidates for the licentiate or for the examination for the title of agrégé (agrégation), essential, one or the other, for appointment as a professor in the lycées or secondary schools. Between 1875 and 1887–88 the number of students in the faculties increased from 9,963 to 17,630. In commenting on this fact, M. Fallières, minister of public instruction at the latter date, said: "In this increase there figure two entirely new categories of students—the student of science and the student of letters. No further back than 1876 these were so few, that they were not mentioned. At present our 2,358 students of letters and our 1,335 students of sciences are real students—permanent pupils of the faculties." The 27,035 students enrolled in 1896 included 6,507 in the faculties specified (letters 3,457, sciences 3,050).

Parallel with this movement, and in some degree an outcome from it, has been that for transforming the several faculties into organic bodies having a measure of independence and free initiative.

The culmination of the successive measures looking to this result is the law of last year (July 10, 1896), conferring the title of university upon the faculties. Each university is to have a council, consisting of the rector, the deans of the faculties, and two delegates from each faculty elected triennially by the professors. This council, subject in certain cases to the approval of the superior council of public instruction, will have control over the teaching, discipline, and property of the university. Since, however, the State will continue to appoint all professors and to pay their salaries, the council will have merely advisory power with respect to appointments and the creation, abolition, or modification of professorships, and with respect also to the income of the university. The maintenance of buildings will be the care of the university and must be defrayed from fees or endowments. The State will take the fees for examinations and State

diplomas, but all other fees will go to the university treasury. In accordance with the law, fifteen universities have been constituted in France. These must now depend largely upon the fees of students and the local resources which they can command, in which respects they present very unequal conditions. The annual receipts of Paris University are estimated at about $120,000; of Lyons, at $26,000. Besançon has not more than $140 and Clermont $160. Evidently, unless the smaller universities secure subsidies from the departments or municipalities, they will not be able to support the character which the law has imposed upon them. That this is clearly recognized is indicated by the addresses at the inaugural ceremonies which occurred at the opening of the winter semester.

At Paris the occasion was not marked by unusual festivities, for indeed the Paris faculties are not so deeply affected by the new law as those outside of the capital. The title which the law confers has never been entirely lost to this group, and the powers which it sanctions had been already conferred by a series of decrees dating back to 1885. [Decrees of July 25 and of December 28, 1885, empowering the faculties to hold and manage property, and constituting councils with powers similar to those conferred upon the university councils; decree of February 21, 1890, conferring the control of their resources and the management of their internal affairs, and law of April 28, 1893, conferring civil personality upon the faculties, and subsequent decrees, August 9 and 10, determining their financial and administrative powers.]

In his report for the year 1896, M. Gréard, president of the Paris council, reviews the history of the decade, showing the development inspired by the recent measures. The material equipment of the university has been greatly improved by the erection of new buildings and the reconstruction of the old. The new Sorbonne is the home of the faculties of letters and science. The faculty of law has its building remodeled. The faculty of medicine has new quarters and its laboratory facilities have been greatly increased.

Many new chairs have been created—2 in the faculty of Protestant theology, 7 in that of law, 2 in the faculty of sciences, 4 in letters, 1 in pharmacy, and the scope of the faculty of medicine has been enlarged by four complete courses. Besides these professorships there have been added many supplementary courses and lectures. The municipality has contributed liberally to this increase of material and scholastic resources. It is noticeable also that private benefactors have borne some part in the enrichment of this university. The Count de Chambrun has provided funds for a course in sociology; the city has endowed a chair of the history of the French revolution in the faculty of letters and in the faculty of sciences a chair of the evolution of organized beings. Besides these foundations about thirty private legacies and donations have been received for the creation of

prizes and scholarships. The belief is expressed that henceforth the generosity of individuals, by which the "institute" has long been favored, will find its way also to the university.

The additions to the university library have increased also year by year. In 1885–86 the number of volumes secured by purchase or gift was 5,430; in 1894–95 it was 13,604. The use of the library has increased proportionately. For 75,000 volumes consulted or borrowed in 1885 there were more than 100,000 in 1895.

Parallel with this growth has been that in the number of students, which rose from 10,679 in 1885 to 14,000 in 1895. In the latter number were included about 1,500 foreigners from Russia, Roumania, Germany, Turkey, Switzerland, and the United States. The report dwells also upon the several measures that have been adopted by the Government, upon advice with the faculties, intended to make instruction more thorough, to cultivate in the students more and more the habit and the passion for the scientific method, and in general to raise the standard of scholarship and to provide for the more complete mastery of special subjects.

In several universities of the provinces the opening ceremonies were brilliant and impressive.

This was particularly the case at Lyons, which ranks next to Paris, and of which the rector, Dr. Compayré, said in the inaugural address, "If Paris is without a peer, Lyons, with its 2,200 students, is without a companion."

Lyons has indeed contributed greatly to the restoration of the university name and state. The campaign inaugurated in 1889 by the "Société des Amis de l'Université" was nowhere more vigorously pressed than at this university seat. The efforts were not confined to the professors. The cause was ardently espoused by the press and the people, who elected councilors pledged to its support. The spirit spread throughout the region and was active in the smaller towns, notably at Bourg and at Puy. The chambers of commerce, industrial associations, and learned societies were all united in the endeavor. As the first fruits of the law so ardently desired, Dr. Compayré noted the gift of $20,000 from a benefactor of the restored university. The students' association, which took its impulse from the spirit excited by the celebration of the new Sorbonne in 1889, contributed greatly to the brilliancy of the Lyons festivities.

At the universities of Lille, Nancy, and Poitiers the ceremonies were marked by equal enthusiasm. The rector of the University of Lille expressed the utmost confidence in the continued liberality of the city, which has already by its efforts advanced its university to the first rank. The faculty of medicine announced the gift of $20,000 from a private source. The name of Pasteur was recalled with pride as the first dean of the faculty of sciences of this university.

The University of Aix-Marseille has great possibilities, which are somewhat clouded for the time by the jealousy of the two rival centers, Aix being the seat of the faculties of law and of letters and Marseille that of the faculties of sciences and of medicine and pharmacy. The endeavor to allay local jealousies by conferring the double name upon the university has been only partially successful. While the universities which have their seats in the great centers of commerce and industry enter upon the new order with great confidence, a different spirit is evinced in the smaller universities. The burden imposed upon the latter was freely admitted at Caen, which sees its ablest students irresistibly attracted to Paris to finish their studies, and which can not hope for municipal subsidies comparable with those of Bordeaux, of Lyons, of Lille, and Marseille. There remains simply the hope that in such cases the university may draw support from the entire academic region. Thus Caen would become the "University of Normandie," adapting itself to the special interests of the region—agricultural, commercial, or industrial—giving large place to the study of local history, the old Norman tongue, Norman laws and monuments, and drawing thereby the sympathies of those who are descended from Norman ancestry and identified with the region and the history of which the university will become the exponent.

The opinion seems to be general that France will not be able to maintain fifteen universities of first rank, and that several of those now constituted will eventually be eliminated, or possibly transformed into special schools.

A new university doctorate open to foreigners.—The superior council of public instruction has decided that French universities may create a doctorate which will be purely scientific, and for which the French diplomas of "bachelier" and "licencié" are not necessarily required. The degree is open alike to natives and foreigners, and it is not required that candidates should have effected the whole of their studies in France.

The following is the text of the decree to this effect, passed July 9 of the present year:

> Besides the degrees established by the State the universities are empowered to institute titles of a nature purely scientific. These titles shall confer none of the rights and privileges attached by law and regulation to the degrees, and shall in no case be declared a substitute.
>
> The studies and examinations which shall attend their distribution shall be subject to regulations deliberated by the council of the university and approved by the standing committee of the superior council of public instruction. The diplomas shall be delivered in the name of the university, by the president of the council, in forms different from the forms of those delivered by the Government.

Up to the present time all diplomas in France have been granted by the State, not by the universities. These diplomas carried professional priviliges and other rights of importance chiefly to French

citizens, and were guarded by necessary formalities with which foreigners, and Americans in particular, found it almost impossible to comply.

DEPARTMENT OF SECONDARY INSTRUCTION.

Scope of secondary schools.—Secondary instruction is a term of somewhat different application in France from that which it has in the United States. The typical secondary schools are the lycées or State classical colleges, long the central feature of the university system, and the church schools (établissements congréganistes) of similar grade. Pupils enter these institutions (either as boarders or day pupils) at about 8 years of age, having already mastered the elements of reading and writing, and remain until their general education is complete. The great end in view is the bachelor's degree, which is the prerequisite to official and professional careers and to social recognition. If a student is able to maintain the maximum of effort, the final examination may be passed and the coveted prize secured at 18 years of age. As a rule, however, pupils do not complete the ten years' course without duplicating one or two years' study. It will be understood from the statement that the secondary school of France is not a grade between elementary and superior institutions, as in this country, but is a school for the complete education of the higher social classes.

Altogether there are for boys five classes of secondary establishments, between which in 1895 the entire enrollment of secondary pupils, 180,791, was distributed as follows:

Institution.	Proportion of students.
	Per cent.
Public lycées and communal colleges	47.37
Church schools	32.10
Small seminaries (clerical)	13.92
Private institutions	6.61

As all degrees are conferred by the State, the examinations being conducted by professors specially detailed for that service, it follows that the course of study prescribed for the lycées (State classical colleges) determines that of all the other secondary schools. The lycée has both a classical and modern course, but since the former leads to the bachelor's degree, it embodies the present ideal of secondary instruction. The programme now in force has been given in full in recent reports of this office,[1] but some repetition of it is desirable for an understanding of the present situation. To premise, the lycée is organized in three sections—elementary (years 8 to 11), grammar (years 11 to 14), superior (14 to 18).

Promotion from one section to the other is secured by examination.

[1] See in particular the report for 1890-91, vol. 1, pp. 120-124.

The studies of the higher section may suffice to indicate the preparation required for the bachelor's degree. They comprise in the third or lowest class of the section, the second class, and class of rhetoric the following: French grammar, literature, and composition; German or English; history of Europe, and of France in particular; geography, mathematics, drawing, Latin, and Greek, and in the second class also, the history of literature (Greek, Latin, and French). The full programme in mathematics, Latin, and Greek for the class of rhetoric (age, 16 years) is as follows:

Mathematics.—One and a half hours per week. Arithmetic: Review through square root. Algebra: Review and continuation through equations of the second degree. Geometry and cosmography: Solid geometry finished—through the sphere; the celestial sphere; earth, sun, time, moon, eclipses, planets, stars, universal gravitation, tides.

Latin.—Four hours a week. Portions of Lucretius, Virgil, Horace, Cicero, Livy, and Tacitus.

Greek.—Four hours a week. Portions of Homer, Sophocles, Plato, and Demosthenes.

After rhetoric comes the first examination for the bachelor's diploma; then follows the class of philosophy, which offers a choice between letters and science; from this class the student passes to the final examination. It will be seen that this programme is comparable to that of an American preparatory school, with two years of college added.

The communal colleges, which are established by local authorities with the aid of the State, offer, so far as practicable, the same course as the lycées. Few of them, however, are able to cover the complete programme.

Rivalry between State and church secondary schools.—Since the secondary establishments are in reality the colleges or schools of liberal culture, exercising through their graduates an immense influence upon society, the State has every motive for seeking to draw students to its own secondary schools; hence it views with alarm the growing ascendency of the clerical establishments. By reference to the table given below it will be seen that while the number of pupils in the public secondary schools has remained nearly stationary for the four years compared, the attendance in the two classes of church schools has greatly increased, rising from 75,035 in 1892 to 82,657.

Classes of institutions.	Enrollment.				Number of institutions in 1895.
	1892.	1893.	1894.	1895.	
Lycées (public)	52,945	53,974	53,490	53,962	109
Communal colleges (public)	32,508	32,700	32,421	33,161	227
Church schools	51,087	51,377	56,265	57,250	397
Small seminaries (clerical) (petits seminaires)	23,948	23,849	25,354	25,407	142
Private establishments	16,306	14,028	14,214	13,011	218

The causes of the movement indicated by the above statistics have been set forth in an official statement, which does not, however, pretend to be exhaustive. They are, as enumerated, increase in tuition fees and living expenses; the cost of books and apparatus; too frequent changes in the courses of study; uncertainties respecting the position of the répétiteurs or tutors, who sustain close relations to the pupils; the want of united interest and sympathies on the part of the officers and professors; the excessive officialism and consequent diminution of the personal influence of professors, and the want of relations between the State secondary and primary schools. It is also recognized that the development of the superior primary schools (public high schools) has had some effect in reducing the attendance upon public secondary schools. From details furnished in the report it appears that the day pupils (externes) are at a peculiar disadvantage, as they must buy the text-books, at a cost of about $10 a year, or $100 for the complete course, whereas these are furnished gratuitously to boarders (internes), save that the parents must pay a small charge (about $2.40 a year) for the wear of the books. This is regarded as an unjustifiable discrimination that should be corrected. Already a revision of the fees for tuition is in progress, with a view to reduction, but this can not be accomplished at once, as it necessitates changes in the appropriation. The other causes that are believed to prevent the growth of the State schools are inherent in the system and can be reached only through a transformation, which seems to be gradually taking place.

While the status of the State schools with respect to attendance is not wholly satisfactory, it is noted in the official report that they contribute a much larger proportion of students to the special schools of the highest order, than the rival institutions. This is an important matter, as these graduates enter eventually into the most influential public services. The following table is presented to show the comparative standing of the several classes of schools in this particular:

Name of special school.	Number of students entering the special schools from—											
	Lycées, colleges, and other establishments of the State or of the city of Paris. (Prytanée, Chaptal, etc.)				Private establishments having special relation to the State schools. (Ste. Barbe, Stanislas, etc.)				Private establishments, lay and clerical.			
	1892.	1893.	1894.	1895.	1892.	1893.	1894.	1895.	1892.	1893.	1894.	1895.
Superior Normal School	41	41	42	41	1	1	1	1	.....	.....	.....	.....
Polytechnic School	185	180	174	165	41	38	26	32	38	31	23	35
School of Saint Cyr	301	316	416	365	34	41	49	51	90	121	139	136
Naval School	43	40	44	42	7	12	6	13	20	23	25	21
Central School	138	150	160	145	27	45	24	27	97	63	71	74
Agronomic Institute	.....	25	44	44	.....	18	21	14	.....	2	29	30

It is an interesting fact that while clerical influence seems just now to threaten the ascendency of the lycées, the State secondary schools and classes for girls established under the law of 1880 appear to be

overcoming the prejudices which they at first encountered. At least such is the inference from the growth in enrollment shown in the following statistics:

Public lycées, colleges, and secondary courses for girls.

Date.	Enrollment.	Date.	Enrollment.
1892	12,744	1894	14,140
1893	13,514	1895	14,436

The administration and studies of these institutions are managed with special reference to the aptitudes, needs, and probable careers of young women. Pupils enter at 12 years of age. The course is divided into two periods of three and of two years, respectively, thus allowing five years for the full period. A sixth year may be added for students who desire to prepare for admission to superior institutions or for special vocations.

State appropriations.—For buildings and equipments alone the State has contributed to secondary institutions since 1878 the sum of $22,173,333, of which a little above $2,000,000 went to the secondary schools for girls. The annual appropriations for the current expenses of the lycées and communal colleges (for boys) and the public secondary schools for girls have been as follows for the years named: 1894, $4,038,248; 1895, $4,073,165; 1896, $4,096,447.20.

The distribution of the appropriation for 1896 was as follows:

Administrative purposes	$29,200.00
State lycées	2,190,400.00
Communal colleges	730,756.80
Secondary schools for girls	410,090.40
Scholarships and funds for remitted fees	736,000.00

The receipts from the lycées are turned into the State treasury. About one-third of the lycées contribute to the treasury more than they receive from it. The remainder do not cover their own expenses. However, the total annual receipts are in general in excess of the current expenditures, the balance accruing to the State being $18,633 in 1896.

The number of State scholarships accorded in 1896 was 3,315 in the lycées and 1,636 in the communal colleges. These are secured by competitive examination. Remission of fees is made in favor of the sons and grandsons of teachers and professors in public schools—that is, in the university service. Complaint is made that the number of scholarships and gratuities has become excessive. It is urged, on the other hand, that the church makes liberal provision, the exact extent of which is unknown, for poor but promising youths and that the State can not at this time afford to diminish the inducements it holds out to students entering upon secondary instruction.

Proposed changes.—The difficulties in the way of desirable changes

in the system of State secondary education are very great, as shown by the efforts of half a century. The most important measure now under consideration relates to the baccalaureate. This diploma has been the subject of proposed reforms for the last decade. Successive ministers of public instruction have embodied their ideas in projects of law, which have been submitted, provoked discussion, and then abandoned. The latest project emanates from the present minister, M. Rambaud, who, without attempting radical changes, would greatly reduce the element of chance in the conditions upon which the diploma is secured. To this end he proposes to give greater weight to the student's record, as shown in his report book (livret scolaire), and to reconstitute the examining bodies so as to include therein "agrégés" or assistant professors who actually teach in the secondary schools. As the project will probably suffer the fate of its predecessors, its details need not be rehearsed. American readers will be more interested in the discussion of the scholastic and social bearings of the diploma called forth by these projects. These are graphically presented in recent articles by M. E. Boutmy, the distinguished writer on moral and political sciences and director of the Paris School of Political Science.

The immediate occasion of M. Boutmy's articles was a project of law offered by the minister preceding M. Rambaud and differing substantially from his own. As this project failed, it will suffice to say here that it proposed to reduce the obligatory part of the baccalaureate examination and to increase the electives, and, further, that the diploma should indicate precisely the subjects in which the candidate had achieved success. The project was favored by M. Boutmy as a means of eliminating the caste tendencies of the diploma and also of freeing the courses of secondary instruction from a paralyzing dependence upon the State examinations.

Extended citations from these articles are presented in an appendix to this chapter.

As regards the programme of studies for the lycées, these have remained unchanged since 1890. Slight modifications have been attempted, one, the introduction of Latin a year earlier than that assigned in the programme, namely, in the seventh or highest class of the preparatory section.

The experiment has, however, been abandoned, as has also that of using the modern pronunciation in Greek classes, which was given up after four months' trial.

The removal of Greek from the class of obligatory subjects has been seriously urged from time to time, but the proposition serves only as an occasion for arguments pro and con. The prevalence of the same discussion in our own country gives interest to a recent address of M. Michel Bréal on the importance of Greek, which is included among the appended papers.

DEPARTMENT OF PRIMARY INSTRUCTION.

The latest official report of the department of primary instruction is for the year 1894–95, a résumé of which was presented in the Commissioner's last report (1895–96). The principal statistics are also repeated in this report (tables, p. 32).

New law respecting teachers' salaries.—The law with respect to the classification and salaries of teachers passed July, 1893, goes into effect the present year. The chief modification which it introduces is in the classification of teachers of the elementary primary schools. The teaching force consists of probationers (stagiaires) and full teachers (titulaires). The former, under the new law, comprise 15 per cent of the total number in place of 20 per cent, as under the previous law, and the annual salary is raised from $160 to $180.

The "titulaires" are divided into five classes. The proportion that each class bears to the total force under the two laws, and the salaries which remain unchanged under the new law, are as follows:

Classes of teachers.	Percentage of total number in each class.		Annual salaries.	
	Law of 1893.	Law of 1889.	Men.	Women.
Fifth class	25	35	$200	$200
Fourth class	25	25	240	240
Third class	20	15	300	280
Second class	10	5	360	310
First class	5		400	320

Observation.—An additional sum of $40 is allowed principals in charge of a school of three or four classes, and of $80 for a school of more than four classes. Communes may and often do supplement these salaries. Moreover, every commune must provide its teachers with free residence or with a money indemnity for the same at fixed rates.

It will be seen that the increase of the proportion of teachers in the third, second, and first classes increases the advantages that the service offers, and at the same time calls for larger appropriations from the State, which pays the salaries.

The principle of a fixed proportion of teachers in each class met with decided opposition in the Chamber of Deputies, and the abolition of these "percentages" in the classification of the teachers of the superior primary (high) schools and in the primary normal schools is regarded as an important triumph.

The salaries of directors and directresses of the two classes of schools remain unchanged. They are as follows:

	Superior primary schools.	Normal schools.	
	Men and women.	Men.	Women.
Fifth class	$360	$700	$600
Fourth class	400	800	700
Third class	450	900	800
Second class	500	1,000	900
First class	560	1,100	1,000

The salaries of assistant teachers in the superior primary schools and of professors in the normal schools are fixed at the following rates:

	Superior primary (assistant teachers).	Normal schools (professors).	
	Men and women.	Men.	Women.
Fifth class	*a* $240	*a* $500	$440
Fourth class	*a* 280	*a* 540	480
Third class	320	*a* 580	520
Second class	380	620	560
First class	*a* 440	680	600

a Increase of $20 over the former salaries.

The State is responsible only for the legal salary of the primary teachers (elementary and superior), and as a rule these are increased by the communes. Thus in Paris the directors of the higher primaries receive as a minimum salary $1,400; maximum, $1,800; full professors from $760 to $1,000.

Scope and progress of superior primary schools.—Superior primary (high) schools are nonclassical high schools which carry the instruction of pupils for two, three, or four years beyond the elementary primaries. They were authorized by Guizot's law of 1833, which also prescribed a programme comprising an extension of the subjects of the lower primaries, with the addition of linear geometry with its useful applications, surveying, elements of the physical sciences, and natural history, with their practical applications. It was further provided that the courses should be specially developed in subjects required by local conditions. The establishment of schools of this grade was made obligatory for communes of more than 6,000 inhabitants. The execution of the law was long delayed by political vicissitudes, and, outside of a few cities which established high schools of the general character indicated without aid from the State, they had no existence until a comparatively recent date. The municipal high schools soon became noted for the excellence of their scientific courses and the artistic and technical skill manifested by their graduates.

In 1878 the General Government indicated its purpose of fostering higher primary schools by a credit of $22,000 to aid communes in their establishment. This appropriation has been augmented year by year, and has proved a great stimulus to local effort.

Peculiar complications arose from the endeavor to class in the same category schools for general instruction and a class of schools industrial or commercial in their character (écoles professionelles) that had been established in a few cities. The development of both classes of schools was retarded until the school law of 1886 prescribed explicitly the scope, studies, and general management of all schools classed as primary.

It soon became evident that high schools with a purely literary curriculum were likely to crowd out those having a technical character, and as this was regarded as a national misfortune measures were taken to increase the provision of the latter class. Accordingly, in 1892 a department of technical instruction was created in the ministry of commerce and industry, and appropriations covering salaries and many other expenses were offered through this ministry for schools giving instruction in commerce and industry to pupils from the elementary schools. Such schools were also transferred to the jurisdiction of the ministry of commerce and industry, and are known as practical schools of commerce and industry. By this arrangement the minister of education was left free to develop higher primary schools of a more educative character.

The purpose, however, was not to increase the literary influence of higher primaries, and the regulations issued since 1892, especially the official programmes of 1893 and also the actual course which these schools have taken, show a strict adherence to the purpose of making them schools for practical training.

Under the regulations of 1893 every higher primary school may have, in addition to its general course, special sections—industrial, commercial, or agricultural. Schools in which these technical departments are distinctly developed come under the direction of the minister of commerce and industry with respect to the same, but as regards teachers and general programmes remain under the minister of public instruction. The various measures indicate the double purpose of fostering manual skill and technical knowledge among the more promising youth of the laboring classes and at the same time extending the scope of their general education.

The initial stage of the higher primary school is often an advanced course (cours complémentaire) annexed to the lower primary and under the same director. These higher primary schools are supported by the combined efforts of the State and the communes. The State assumes the legal salaries of the regular staff, which amounts to about five-sevenths of the total salaries required to maintain the full complement of teachers. The municipality (commune) must pay the

salaries of teachers in charge of the workshop and also of the persons employed as technical and industrial teachers.

The expense for buildings, furniture, apparatus, etc., must also be met by the commune.

The State assists in bringing the provision within the reach of poor but promising youth by a system of scholarships. These are of three classes:

(*a*) "D'internat," to cover or partially cover the expenses of pupils in boarding schools, not to exceed $100 per annum.

(*b*) "Familiales," to pay for boarding out the scholar in a private family when his home is at a long distance from the school and the latter has no boarding house; value, $100.

(*c*) "D'entretien," to pay the parents for the scholar's food, clothes, traveling expenses, etc., and to help toward making good the sacrifice of his wages while he is kept at school (varying from $20 to $80).

Candidates must not be less than 12 or more than 15 years of age. The scholarships are tenable for three years, with possible extension to a fourth year.

These scholarships are secured by strict competitive examination and only by successful candidates who can prove that they would be unable without the assistance to continue their studies. The number of State scholarships awarded in 1892 was: To boys, 674; to girls, 436, or a total of 1,110. The departments and communes also provide scholarships.

Under the admission requirements prescribed by the minister for all pupils, no child can enter the higher primaries unless he has obtained the "certificate of primary instruction" and has passed a year in the highest standards of the elementary schools, or if educated privately can prove equivalent attainments.

The recent increase in the number of these establishments is indicated by the following statistics:

In 1878 they numbered only 40. In 1887 there were 255, besides 431 complementary courses. At this date 47 private schools of the same grade were reported. The total enrollment, public and private schools, was 38,441. In 1892 the situation was as follows:

France and Algiers.

	Number of schools.			Enrollment.		
	Boys.	Girls.	Total.	Boys.	Girls.	Total.
Public schools:						
Two years' course	71	30	101	20,461	7,415	27,876
Three or more years	133	47	180			
Private schools	10	11	21	2,305	1,360	3,755
Complementary courses:						
Public	351	131	482	9,950	4,018	13,968
Private	151	380	531			
Grand total	716	599	1,315	32,806	12,793	45,599

The increase in enrollment in five years, it will be seen, was 7,158 pupils.

Among the public schools are included 47 which are essentially technical, and as such under the joint control of the two ministers, as already specified.

The following additional particulars with respect to this feature of the primary-school system of France are from a very exhaustive report on the subject by Mr. R. L. Morant, assistant director of the recently created department of special inquiries and reports in the English department.[1]

Organization.—One very important point should here be noted; both the "cours complémentaires" and the higher primary schools are, in intention, "écoles régionales;" that is to say, though their creation and maintenance is decided upon and paid for by one commune or town, most of them serve the needs, not only of the town itself, but of all the surrounding districts. Many of them draw pupils from a radius of several leagues, and, though the town itself has borne all the expense of establishing and maintaing the schools, no restrictions are as a rule placed upon the district from which scholars are admitted.

As a result of being "écoles régionales," a large number both of the higher primary schools and of the "cours complémentaires" have boarding houses. These are built by the town at the same time as the rest of the school.[2]

Sometimes they are managed by the town under a salaried "économe" or burser and bring in actual profits to the town budget; but in the vast majority of cases, in the provinces at least, they are left to the charge (and profit) of the director of the school. Half the boys' higher primary schools and two-thirds of those for girls have "internats," i. e., are at least partly boarding schools. This is the case also with half the boys' "cours complémentaires" and nearly one-third of those for girls. There is thus in France practically a widespread system of municipal boarding schools, with the staff supplied at the expense of the State.

The fees for the boarding houses vary from $80 to $150 per annum, the greater number ranging about $125. For the externes or day boys there is also in most schools a system of "études surveillées;" that is to say, pupils may stay at the school beyond the fixed school hours (usually 8 a. m. to 11 a. m., and 1 p. m. to 4 p. m.), under the supervision of the school staff, from 5 to 7 p. m. A charge is made for this in most schools, but not in all, amounting to $10 or $15 a year. In Paris great discussion has arisen upon this point, the progressive members on the council insisting that these charges are contrary to the spirit of the free-education act, and tend to place hindrances in the way of the spread of higher primary instruc-

[1] The report is published in the first volume issued by the new department, pages 290–336.

[2] In many cases the higher primary schools have previously been private schools, taken over at a valuation by the municipality, the original director and staff being often retained.

tion among the working classes. The outlay for books and other requirements varies considerably. In the larger towns this is generally provided by the municipal funds free. No fees may be charged for "instruction," for the higher primary schools and the "cours complémentaires" are held to be included under the term "public establishments for primary instruction," in which "gratuité" was enforced by the free-education act of 1881.

The higher primary school is open to all comers without distinction who come up to the prescribed standard of knowledge. Children who, having been educated privately, do not possess the elementary certificate are submitted to an examination equivalent to it in the subjects of the upper standards of the elementary school. But, as a matter of fact, about 90 per cent of these schools are recruited entirely from the public elementary schools, and it is only in those country districts where no means of obtaining any form of secondary education exist within any reasonable distance that the contrary is the case.

As regards the standard of admission to the school, the central authority has attempted to raise the general level by various means, and to confine the admission more strictly to the élitê of the elementary schools, by requiring that no pupil be admitted unless, besides holding the elementary certificate, he has passed a year in the highest standard of the elementary school. In many places there is also an entrance examination, the standard of which is practically decided upon by the local authority, and sometimes considerably raises the standard of the school. And in a few of the largest towns, where the number of candidates is greater than the number of vacancies, this examination comes to be a competitive examination. In Paris there is one simultaneous public examination for all the higher primary schools. The successful candidates, i. e., those who pass a certain standard of marks, are ranged in order of merit, and are then called upon (in this order) to choose the school to which they prefer to go, according to the number of vacancies that are available in each. There is also an examination at the end of each quarter, of which the results are sent to the parents. These examinations are a great stimulus to hard work, and assist also in pointing out the pupils who would be unable to profit by a continued stay at the school. These are invariably "advised" to leave. It is very generally understood, and is carried into practice, that one of the most important duties of the director is to advise parents for and against the continuance of the children's attendance at the school, as also in the matter of choosing the particular section (commercial, industrial, etc.) which he shall enter. The director's opinion is invariably (and, indeed, statutorily) decisive on the former point, besides being very generally paramount as to the latter.

The school is divided into "years" of study, and promotions into each division or "year" take place only once in twelve months. For this purpose there is an annual examination of a very searching nature, called "examen du passage;" and it is only upon passing this examination that a pupil is moved into the next "year." Anyone failing to pass has either to leave or to "redoubler," i. e., to stay another year in the division in which he has already been working. This occurs in a great number of cases, especially at the end of the first "year."

This annual examination and its consequences is one of the most striking features of the system, and admirably prevents any waste of public funds and of teacher's energy in vain attempts to educate children who are not capable enough to profit by their opportunities.

Mention must also be made of the important part played in the actual management of each school by its "comité de patronage." The composition of each committee of managers is fixed by the education department on the nomination of its local representative. The director or directress of the school is an ex officio member, as also is the primary inspector of the district and the chief inspector of the province. In the case of girls' schools there must be a certain number of ladies on the committee. The committee nominates its own president and secretary. It

meets at least twice in each year, at the summons of the president, and in special cases when convened by the president or by the provincial inspector. At its ordinary meetings it nominates a subcommittee to visit the school at least once a month and report to the committee at the next meeting. The committee is intrusted with the general supervision of the schools and of all that pertains to its efficiency and the interests of the pupils. It takes the latter under its patronage and endeavors to settle them in suitable occupations at the end of their school course. The pupils holding State scholarships are especially under the care of the committee.[1] It further deals with all matters of school requisites and furniture and decides on the measures to be taken to adapt the special instruction to the local requirements, industries, manufactures, agricultural or other occupations. For this purpose all prominent business men in the locality are nominated on these committees.

Curriculum.—The first year's course is the same for all pupils who enter the school, no specialization being permitted till the commencement of the second year. It is then that the student decides, generally under the advice of the director, the particular section in which he will pursue his course. The particular characteristics of each of the sections (general, commercial, industrial, and agricultural) appear in the number of hours allotted to the different subjects in each section respectively. There are six subjects, however, which do not vary at all, being considered to represent the basis of all instruction, and to be, therefore, necessary to every section alike. Thus morals, handwriting, history, civic instruction, gymnastics, and singing are taught one hour a week each, both to boys and girls, in all three years and in all the sections, and boys have two hours and girls one hour for physics and chemistry in all three years in all sections. Elementary notions of common law and political economy are taught one hour a week in the third year of each section both to boys and girls.

The other subjects of instruction vary considerably in the different sections.

Thus, for modern languages, the general section has three hours a week in all three years both for girls and boys, while in the commercial section this is raised to four hours for both and in the industrial section it disappears entirely for boys, being replaced by additional mathematics, science, and manual work. The girls' industrial section, however, retains three hours a week for modern languages and does not increase the mathematics.

Similarly, drawing and modeling, both for boys and girls, is given four and a half hours a week in the industrial section, three hours in the general section, and only one and a half in the commercial section. Both the commercial and industrial sections make up for their increase of special subjects by reducing their French language and literature.

Each section, has of course, its own specialties. The chief characteristic of the general section is the amount of time given to French language and literature—from three to five hours a week for boys and girls alike. It is from this section that the normal colleges are largely recruited, and "general culture" is considered its main purpose.

The industrial section is naturally characterized by more mathematics and technical drawing, and also by its manual work, "travaux manuels," which take six hours a week, as contrasted with two hours in the commercial section.

The characteristics of the commercial section are, as would be expected, bookkeeping and languages, the former being represented by three hours a week, as compared with one hour in the other sections, and the latter by four hours a week. There is also an additional hour for commercial geography.

The agricultural section, in its turn, has no modern languages, very little draw-

[1] See Elementary Education in France. Simpkin, Marshall & Co., London, 1891, page 85.

The causes of the movement indicated by the above statistics have been set forth in an official statement, which does not, however, pretend to be exhaustive. They are, as enumerated, increase in tuition fees and living expenses; the cost of books and apparatus; too frequent changes in the courses of study; uncertainties respecting the position of the répétiteurs or tutors, who sustain close relations to the pupils; the want of united interest and sympathies on the part of the officers and professors; the excessive officialism and consequent diminution of the personal influence of professors, and the want of relations between the State secondary and primary schools. It is also recognized that the development of the superior primary schools (public high schools) has had some effect in reducing the attendance upon public secondary schools. From details furnished in the report it appears that the day pupils (externes) are at a peculiar disadvantage, as they must buy the text-books, at a cost of about $10 a year, or $100 for the complete course, whereas these are furnished gratuitously to boarders (internes), save that the parents must pay a small charge (about $2.40 a year) for the wear of the books. This is regarded as an unjustifiable discrimination that should be corrected. Already a revision of the fees for tuition is in progress, with a view to reduction, but this can not be accomplished at once, as it necessitates changes in the appropriation. The other causes that are believed to prevent the growth of the State schools are inherent in the system and can be reached only through a transformation, which seems to be gradually taking place.

While the status of the State schools with respect to attendance is not wholly satisfactory, it is noted in the official report that they contribute a much larger proportion of students to the special schools of the highest order, than the rival institutions. This is an important matter, as these graduates enter eventually into the most influential public services. The following table is presented to show the comparative standing of the several classes of schools in this particular:

Name of special school.	Number of students entering the special schools from—											
	Lycées, colleges, and other establishments of the State or of the city of Paris. (Prytanée, Chaptal, etc.)				Private establishments having special relation to the State schools. (Ste. Barbe, Stanislas, etc.)				Private establishments, lay and clerical.			
	1892.	1893.	1894.	1895.	1892.	1893.	1894.	1895.	1892.	1893.	1894.	1895.
Superior Normal School	41	41	42	41	1	1	1	1	.....	.....	.....	.....
Polytechnic School	185	180	174	165	41	38	26	32	38	31	23	35
School of Saint Cyr	301	316	416	365	34	41	49	51	90	121	139	136
Naval School	43	40	44	42	7	12	6	13	20	23	25	21
Central School	138	150	160	145	27	45	24	27	97	63	71	74
Agronomic Institute	.....	25	44	44	.....	18	21	14	.....	2	29	30

It is an interesting fact that while clerical influence seems just now to threaten the ascendency of the lycées, the State secondary schools and classes for girls established under the law of 1880 appear to be

overcoming the prejudices which they at first encountered. At least such is the inference from the growth in enrollment shown in the following statistics:

Public lycées, colleges, and secondary courses for girls.

Date.	Enrollment.	Date.	Enrollment.
1892	12,744	1894	14,140
1893	13,514	1895	14,436

The administration and studies of these institutions are managed with special reference to the aptitudes, needs, and probable careers of young women. Pupils enter at 12 years of age. The course is divided into two periods of three and of two years, respectively, thus allowing five years for the full period. A sixth year may be added for students who desire to prepare for admission to superior institutions or for special vocations.

State appropriations.—For buildings and equipments alone the State has contributed to secondary institutions since 1878 the sum of $22,173,333, of which a little above $2,000,000 went to the secondary schools for girls. The annual appropriations for the current expenses of the lycées and communal colleges (for boys) and the public secondary schools for girls have been as follows for the years named: 1894, $4,038,248; 1895, $4,073,165; 1896, $4,096,447.20.

The distribution of the appropriation for 1896 was as follows:

Administrative purposes	$29,200.00
State lycées	2,190,400.00
Communal colleges	730,756.80
Secondary schools for girls	410,090.40
Scholarships and funds for remitted fees	736,000.00

The receipts from the lycées are turned into the State treasury. About one-third of the lycées contribute to the treasury more than they receive from it. The remainder do not cover their own expenses. However, the total annual receipts are in general in excess of the current expenditures, the balance accruing to the State being $18,633 in 1896.

The number of State scholarships accorded in 1896 was 3,315 in the lycées and 1,636 in the communal colleges. These are secured by competitive examination. Remission of fees is made in favor of the sons and grandsons of teachers and professors in public schools—that is, in the university service. Complaint is made that the number of scholarships and gratuities has become excessive. It is urged, on the other hand, that the church makes liberal provision, the exact extent of which is unknown, for poor but promising youths and that the State can not at this time afford to diminish the inducements it holds out to students entering upon secondary instruction.

Proposed changes.—The difficulties in the way of desirable changes

in the system of State secondary education are very great, as shown by the efforts of half a century. The most important measure now under consideration relates to the baccalaureate. This diploma has been the subject of proposed reforms for the last decade. Successive ministers of public instruction have embodied their ideas in projects of law, which have been submitted, provoked discussion, and then abandoned. The latest project emanates from the present minister, M. Rambaud, who, without attempting radical changes, would greatly reduce the element of chance in the conditions upon which the diploma is secured. To this end he proposes to give greater weight to the student's record, as shown in his report book (livret scolaire), and to reconstitute the examining bodies so as to include therein "agrégés" or assistant professors who actually teach in the secondary schools. As the project will probably suffer the fate of its predecessors, its details need not be rehearsed. American readers will be more interested in the discussion of the scholastic and social bearings of the diploma called forth by these projects. These are graphically presented in recent articles by M. E. Boutmy, the distinguished writer on moral and political sciences and director of the Paris School of Political Science.

The immediate occasion of M. Boutmy's articles was a project of law offered by the minister preceding M. Rambaud and differing substantially from his own. As this project failed, it will suffice to say here that it proposed to reduce the obligatory part of the baccalaureate examination and to increase the electives, and, further, that the diploma should indicate precisely the subjects in which the candidate had achieved success. The project was favored by M. Boutmy as a means of eliminating the caste tendencies of the diploma and also of freeing the courses of secondary instruction from a paralyzing dependence upon the State examinations.

Extended citations from these articles are presented in an appendix to this chapter.

As regards the programme of studies for the lycées, these have remained unchanged since 1890. Slight modifications have been attempted, one, the introduction of Latin a year earlier than that assigned in the programme, namely, in the seventh or highest class of the preparatory section.

The experiment has, however, been abandoned, as has also that of using the modern pronunciation in Greek classes, which was given up after four months' trial.

The removal of Greek from the class of obligatory subjects has been seriously urged from time to time, but the proposition serves only as an occasion for arguments pro and con. The prevalence of the same discussion in our own country gives interest to a recent address of M. Michel Bréal on the importance of Greek, which is included among the appended papers.

DEPARTMENT OF PRIMARY INSTRUCTION.

The latest official report of the department of primary instruction is for the year 1894–95, a résumé of which was presented in the Commissioner's last report (1895–96). The principal statistics are also repeated in this report (tables, p. 32).

New law respecting teachers' salaries.—The law with respect to the classification and salaries of teachers passed July, 1893, goes into effect the present year. The chief modification which it introduces is in the classification of teachers of the elementary primary schools. The teaching force consists of probationers (stagiaires) and full teachers (titulaires). The former, under the new law, comprise 15 per cent of the total number in place of 20 per cent, as under the previous law, and the annual salary is raised from $160 to $180.

The "titulaires" are divided into five classes. The proportion that each class bears to the total force under the two laws, and the salaries which remain unchanged under the new law, are as follows:

Classes of teachers.	Percentage of total number in each class.		Annual salaries.	
	Law of 1893.	Law of 1889.	Men.	Women.
Fifth class	25	35	$200	$200
Fourth class	25	25	240	240
Third class	20	15	300	280
Second class	10	5	360	300
First class	5		400	320

Observation.—An additional sum of $40 is allowed principals in charge of a school of three or four classes, and of $80 for a school of more than four classes. Communes may and often do supplement these salaries. Moreover, every commune must provide its teachers with free residence or with a money indemnity for the same at fixed rates.

It will be seen that the increase of the proportion of teachers in the third, second, and first classes increases the advantages that the service offers, and at the same time calls for larger appropriations from the State, which pays the salaries.

The principle of a fixed proportion of teachers in each class met with decided opposition in the Chamber of Deputies, and the abolition of these "percentages" in the classification of the teachers of the superior primary (high) schools and in the primary normal schools is regarded as an important triumph.

The salaries of directors and directresses of the two classes of schools remain unchanged. They are as follows:

	Superior primary schools.	Normal schools.	
	Men and women.	Men.	Women.
Fifth class	$360	$700	$600
Fourth class	400	800	700
Third class	450	900	800
Second class	500	1,000	900
First class	560	1,100	1,000

The salaries of assistant teachers in the superior primary schools and of professors in the normal schools are fixed at the following rates:

	Superior primary (assistant teachers).	Normal schools (professors).	
	Men and women.	Men.	Women.
Fifth class	*a* $240	*a* $500	$440
Fourth class	*a* 280	*a* 540	480
Third class	320	*a* 580	520
Second class	380	620	560
First class	*a* 440	680	600

a Increase of $20 over the former salaries.

The State is responsible only for the legal salary of the primary teachers (elementary and superior), and as a rule these are increased by the communes. Thus in Paris the directors of the higher primaries receive as a minimum salary $1,400; maximum, $1,800; full professors from $760 to $1,000.

Scope and progress of superior primary schools.—Superior primary (high) schools are nonclassical high schools which carry the instruction of pupils for two, three, or four years beyond the elementary primaries. They were authorized by Guizot's law of 1833, which also prescribed a programme comprising an extension of the subjects of the lower primaries, with the addition of linear geometry with its useful applications, surveying, elements of the physical sciences, and natural history, with their practical applications. It was further provided that the courses should be specially developed in subjects required by local conditions. The establishment of schools of this grade was made obligatory for communes of more than 6,000 inhabitants. The execution of the law was long delayed by political vicissitudes, and, outside of a few cities which established high schools of the general character indicated without aid from the State, they had no existence until a comparatively recent date. The municipal high schools soon became noted for the excellence of their scientific courses and the artistic and technical skill manifested by their graduates.

In 1878 the General Government indicated its purpose of fostering higher primary schools by a credit of $22,000 to aid communes in their establishment. This appropriation has been augmented year by year, and has proved a great stimulus to local effort.

Peculiar complications arose from the endeavor to class in the same category schools for general instruction and a class of schools industrial or commercial in their character (écoles professionelles) that had been established in a few cities. The development of both classes of schools was retarded until the school law of 1886 prescribed explicitly the scope, studies, and general management of all schools classed as primary.

It soon became evident that high schools with a purely literary curriculum were likely to crowd out those having a technical character, and as this was regarded as a national misfortune measures were taken to increase the provision of the latter class. Accordingly, in 1892 a department of technical instruction was created in the ministry of commerce and industry, and appropriations covering salaries and many other expenses were offered through this ministry for schools giving instruction in commerce and industry to pupils from the elementary schools. Such schools were also transferred to the jurisdiction of the ministry of commerce and industry, and are known as practical schools of commerce and industry. By this arrangement the minister of education was left free to develop higher primary schools of a more educative character.

The purpose, however, was not to increase the literary influence of higher primaries, and the regulations issued since 1892, especially the official programmes of 1893 and also the actual course which these schools have taken, show a strict adherence to the purpose of making them schools for practical training.

Under the regulations of 1893 every higher primary school may have, in addition to its general course, special sections—industrial, commercial, or agricultural. Schools in which these technical departments are distinctly developed come under the direction of the minister of commerce and industry with respect to the same, but as regards teachers and general programmes remain under the minister of public instruction. The various measures indicate the double purpose of fostering manual skill and technical knowledge among the more promising youth of the laboring classes and at the same time extending the scope of their general education.

The initial stage of the higher primary school is often an advanced course (cours complémentaire) annexed to the lower primary and under the same director. These higher primary schools are supported by the combined efforts of the State and the communes. The State assumes the legal salaries of the regular staff, which amounts to about five-sevenths of the total salaries required to maintain the full complement of teachers. The municipality (commune) must pay the

salaries of teachers in charge of the workshop and also of the persons employed as technical and industrial teachers.

The expense for buildings, furniture, apparatus, etc., must also be met by the commune.

The State assists in bringing the provision within the reach of poor but promising youth by a system of scholarships. These are of three classes:

(*a*) "D'internat," to cover or partially cover the expenses of pupils in boarding schools, not to exceed $100 per annum.

(*b*) "Familiales," to pay for boarding out the scholar in a private family when his home is at a long distance from the school and the latter has no boarding house; value, $100.

(*c*) "D'entretien," to pay the parents for the scholar's food, clothes, traveling expenses, etc., and to help toward making good the sacrifice of his wages while he is kept at school (varying from $20 to $80).

Candidates must not be less than 12 or more than 15 years of age. The scholarships are tenable for three years, with possible extension to a fourth year.

These scholarships are secured by strict competitive examination and only by successful candidates who can prove that they would be unable without the assistance to continue their studies. The number of State scholarships awarded in 1892 was: To boys, 674; to girls, 436, or a total of 1,110. The departments and communes also provide scholarships.

Under the admission requirements prescribed by the minister for all pupils, no child can enter the higher primaries unless he has obtained the "certificate of primary instruction" and has passed a year in the highest standards of the elementary schools, or if educated privately can prove equivalent attainments.

The recent increase in the number of these establishments is indicated by the following statistics:

In 1878 they numbered only 40. In 1887 there were 255, besides 431 complementary courses. At this date 47 private schools of the same grade were reported. The total enrollment, public and private schools, was 38,441. In 1892 the situation was as follows:

France and Algiers.

	Number of schools.			Enrollment.		
	Boys.	Girls.	Total.	Boys.	Girls.	Total.
Public schools:						
Two years' course	71	30	101	20,461	7,415	27,876
Three or more years	133	47	180			
Private schools	10	11	21	2,395	1,360	3,755
Complementary courses:						
Public	351	131	482	9,950	4,018	13,968
Private	151	380	531			
Grand total	716	599	1,315	32,806	12,793	45,599

The increase in enrollment in five years, it will be seen, was 7,158 pupils.

Among the public schools are included 47 which are essentially technical, and as such under the joint control of the two ministers, as already specified.

The following additional particulars with respect to this feature of the primary-school system of France are from a very exhaustive report on the subject by Mr. R. L. Morant, assistant director of the recently created department of special inquiries and reports in the English department.[1]

Organization.—One very important point should here be noted; both the "cours complémentaires" and the higher primary schools are, in intention, "écoles régionales;" that is to say, though their creation and maintenance is decided upon and paid for by one commune or town, most of them serve the needs, not only of the town itself, but of all the surrounding districts. Many of them draw pupils from a radius of several leagues, and, though the town itself has borne all the expense of establishing and maintaing the schools, no restrictions are as a rule placed upon the district from which scholars are admitted.

As a result of being "écoles régionales," a large number both of the higher primary schools and of the "cours complémentaires" have boarding houses. These are built by the town at the same time as the rest of the school.[2]

Sometimes they are managed by the town under a salaried "économe" or burser and bring in actual profits to the town budget; but in the vast majority of cases, in the provinces at least, they are left to the charge (and profit) of the director of the school. Half the boys' higher primary schools and two-thirds of those for girls have "internats," i. e., are at least partly boarding schools. This is the case also with half the boys' "cours complémentaires" and nearly one-third of those for girls. There is thus in France practically a widespread system of municipal boarding schools, with the staff supplied at the expense of the State.

The fees for the boarding houses vary from $80 to $150 per annum, the greater number ranging about $125. For the externes or day boys there is also in most schools a system of "études surveillées;" that is to say, pupils may stay at the school beyond the fixed school hours (usually 8 a. m. to 11 a. m., and 1 p. m. to 4 p. m.), under the supervision of the school staff, from 5 to 7 p. m. A charge is made for this in most schools, but not in all, amounting to $10 or $15 a year. In Paris great discussion has arisen upon this point, the progressive members on the council insisting that these charges are contrary to the spirit of the free-education act, and tend to place hindrances in the way of the spread of higher primary instruc-

[1] The report is published in the first volume issued by the new department, pages 290–336.

[2] In many cases the higher primary schools have previously been private schools, taken over at a valuation by the municipality, the original director and staff being often retained.

tion among the working classes. The outlay for books and other requirements varies considerably. In the larger towns this is generally provided by the municipal funds free. No fees may be charged for "instruction," for the higher primary schools and the "cours complémentaires" are held to be included under the term "public establishments for primary instruction," in which "gratuité" was enforced by the free-education act of 1881.

The higher primary school is open to all comers without distinction who come up to the prescribed standard of knowledge. Children who, having been educated privately, do not possess the elementary certificate are submitted to an examination equivalent to it in the subjects of the upper standards of the elementary school. But, as a matter of fact, about 90 per cent of these schools are recruited entirely from the public elementary schools, and it is only in those country districts where no means of obtaining any form of secondary education exist within any reasonable distance that the contrary is the case.

As regards the standard of admission to the school, the central authority has attempted to raise the general level by various means, and to confine the admission more strictly to the élitê of the elementary schools, by requiring that no pupil be admitted unless, besides holding the elementary certificate, he has passed a year in the highest standard of the elementary school. In many places there is also an entrance examination, the standard of which is practically decided upon by the local authority, and sometimes considerably raises the standard of the school. And in a few of the largest towns, where the number of candidates is greater than the number of vacancies, this examination comes to be a competitive examination. In Paris there is one simultaneous public examination for all the higher primary schools. The successful candidates, i. e., those who pass a certain standard of marks, are ranged in order of merit, and are then called upon (in this order) to choose the school to which they prefer to go, according to the number of vacancies that are available in each. There is also an examination at the end of each quarter, of which the results are sent to the parents. These examinations are a great stimulus to hard work, and assist also in pointing out the pupils who would be unable to profit by a continued stay at the school. These are invariably "advised" to leave. It is very generally understood, and is carried into practice, that one of the most important duties of the director is to advise parents for and against the continuance of the children's attendance at the school, as also in the matter of choosing the particular section (commercial, industrial, etc.) which he shall enter. The director's opinion is invariably (and, indeed, statutorily) decisive on the former point, besides being very generally paramount as to the latter.

The school is divided into "years" of study, and promotions into each division or "year" take place only once in twelve months. For this purpose there is an annual examination of a very searching nature, called "examen du passage;" and it is only upon passing this examination that a pupil is moved into the next "year." Anyone failing to pass has either to leave or to "redoubler," i. e., to stay another year in the division in which he has already been working. This occurs in a great number of cases, especially at the end of the first "year."

This annual examination and its consequences is one of the most striking features of the system, and admirably prevents any waste of public funds and of teacher's energy in vain attempts to educate children who are not capable enough to profit by their opportunities.

Mention must also be made of the important part played in the actual management of each school by its "comité de patronage." The composition of each committee of managers is fixed by the education department on the nomination of its local representative. The director or directress of the school is an ex officio member, as also is the primary inspector of the district and the chief inspector of the province. In the case of girls' schools there must be a certain number of ladies on the committee. The committee nominates its own president and secretary. It

meets at least twice in each year, at the summons of the president, and in special cases when convened by the president or by the provincial inspector. At its ordinary meetings it nominates a subcommittee to visit the school at least once a month and report to the committee at the next meeting. The committee is intrusted with the general supervision of the schools and of all that pertains to its efficiency and the interests of the pupils. It takes the latter under its patronage and endeavors to settle them in suitable occupations at the end of their school course. The pupils holding State scholarships are especially under the care of the committee.[1] It further deals with all matters of school requisites and furniture and decides on the measures to be taken to adapt the special instruction to the local requirements, industries, manufactures, agricultural or other occupations. For this purpose all prominent business men in the locality are nominated on these committees.

Curriculum.—The first year's course is the same for all pupils who enter the school, no specialization being permitted till the commencement of the second year. It is then that the student decides, generally under the advice of the director, the particular section in which he will pursue his course. The particular characteristics of each of the sections (general, commercial, industrial, and agricultural) appear in the number of hours allotted to the different subjects in each section respectively. There are six subjects, however, which do not vary at all, being considered to represent the basis of all instruction, and to be, therefore, necessary to every section alike. Thus morals, handwriting, history, civic instruction, gymnastics, and singing are taught one hour a week each, both to boys and girls, in all three years and in all the sections, and boys have two hours and girls one hour for physics and chemistry in all three years in all sections. Elementary notions of common law and political economy are taught one hour a week in the third year of each section both to boys and girls.

The other subjects of instruction vary considerably in the different sections.

Thus, for modern languages, the general section has three hours a week in all three years both for girls and boys, while in the commercial section this is raised to four hours for both and in the industrial section it disappears entirely for boys, being replaced by additional mathematics, science, and manual work. The girls' industrial section, however, retains three hours a week for modern languages and does not increase the mathematics.

Similarly, drawing and modeling, both for boys and girls, is given four and a half hours a week in the industrial section, three hours in the general section, and only one and a half in the commercial section. Both the commercial and industrial sections make up for their increase of special subjects by reducing their French language and literature.

Each section, has of course, its own specialties. The chief characteristic of the general section is the amount of time given to French language and literature—from three to five hours a week for boys and girls alike. It is from this section that the normal colleges are largely recruited, and "general culture" is considered its main purpose.

The industrial section is naturally characterized by more mathematics and technical drawing, and also by its manual work, "travaux manuels," which take six hours a week, as contrasted with two hours in the commercial section.

The characteristics of the commercial section are, as would be expected, bookkeeping and languages, the former being represented by three hours a week, as compared with one hour in the other sections, and the latter by four hours a week. There is also an additional hour for commercial geography.

The agricultural section, in its turn, has no modern languages, very little draw-

[1] See Elementary Education in France. Simpkin, Marshall & Co., London, 1891, page 85.

ing, and is stronger in the natural sciences and in manual occupations bearing upon soil culture. It is of more recent foundation than the others, and is destined to play a great part in the technical education of the French agriculturist, especially while true "technical" classes in agriculture are still so rare. * * *

For girls the programme of subjects, as regards the detailed curriculum, differs but little from that of the boys. They are given one hour a week in the third year for domestic economy, and the practical side of this subject forms an important part of their "travaux manuels." In the industrial, commercial, and agricultural sections the curriculum for girls is purposely left to be decided according to the needs of each locality. Thus the departmental instructions say: "It will be very necessary to take local needs into consideration for the determination of this supplementary programme and for fixing the extra hours of teaching, so that the entry of pupils into industrial or commercial schools of the district may be made as easy as possible."

But perhaps the most interesting, and certainly the most controversial, question in the curriculum of the higher primary schools is that of the "travaux manuels." There is no doubt that in the intention of the education department the higher primary schools are not to teach, or even to prepare for, any one particular trade. Thus M. Brunel, director of primary instruction for the northern departments, says: "The general character of the teaching which obtains in higher primary schools applies equally in the matter of the manual work, in spite of the varied occupations dealt with. The object of the manual work is, first, to educate the eye and hand. In applying this education there is a gradual tendency toward a more special object. But the special sections do not prepare either artisans, or commercial clerks, or agriculturists, but find out and develop in each student the aptitude to become some one of these. They give the students an inclination, so to speak. They put them at the point of entrance into the calling in which they will have to pass their lives, having furnished them with a better provision for life's journey."

When the "travaux manuels" or any other part of the school course give instruction in the definite practice of any particular industry, the school ought, according to the statutes, to be classed as an "école pratique d'industrie" and placed under the minister of technical instruction, and similarly also if it teaches the practice of any special commercial business.

So that it is in the programme of the "travaux manuels" that the general character of the instruction given in higher primary schools (properly so called) is perhaps most apparent. In carrying out the programme considerable variety of application is possible, and, in fact, exists; but there are a certain number of recognized models, both in woodwork and ironwork, which are practically in universal use and serve sufficiently to demonstrate the general course of the study adopted. Moreover, the fact that every section alike—general, commercial, and industrial—is put through the same course of "travaux manuels" conclusively shows that no specialization or trade apprenticeship is intended or attempted; and though the industrial section has six hours a week for travaux manuels, and the commercial section only two, and the general section four, the same curriculum is required in each, the special directions for the special sections being simply as follows: "For the commercial section the programme is to be confined to the most usual and elementary exercises. For the industrial and agricultural sections the programme is to be the same as in the general section, but covering rather more ground."

By article 39 of the decree of December, 1893 (the latest regulations for the organization of these schools), every higher primary school and every "cours complémentaire" must have a workshop, and every pupil is put through the wood course as well as the iron course; and the object always to be held in view is to develop skillfulness of hand and eye and general acquaintance with the use of

tools and with the properties of wood and iron in every child before leaving the school, whatever his vocation in life may be. There is to be no attempt to simulate a genuine apprenticeship.

The drawing and modeling courses are in general the same for each section. The industrial section only adds working models of simple machinery made from sketches and scale drawings, and in the commercial and agricultural sections some additional scale drawing is given, so that in this subject, too, the student is not intended to specialize. Thus M. Le Blanc says: "The 'école primaire supérieure,' and even the 'école professionnelle,' does not prepare draftsmen. Industry provides herself with these by other means. It educates the prospective workingman so that he shall know both how to read and how to execute drawings of the kind generally used in workshops, but it does not turn out skilled draftsmen such as are produced in architects' studios."

At the same time exceptions may be made for local requirements. Thus M. Brunel says: "The elasticity of the organization of higher primary education leaves room for innovations necessitated by local needs. Thus in one of our 'écoles supérieures' for girls in the north we inaugurated a course of industrial drawing, intended to prepare artists whose talent would enable them to find assured employment in the manufacture of textile fabrics."

It should be added that there is an important note in the official programme of the "travaux manuels" which requires every exercise to be done after a sketch and scale drawing, a point which is held of great importance in fixing the educative value of all woodwork training as apart from mere carpenter's dexterity.

Mention must also be made of the excellent foreign-travel scholarships—"bourses de séjour à l'étranger." These date from 1883, and owe their origin, like so much of the best parts of French primary education, to M. Buisson. The first candidates were sent to Switzerland on an allowance of $20 a month, and were chiefly intended to enter the teaching profession on their return to France. The results achieved were so satisfactory that the system was rapidly extended. Various changes have occurred in the arrangements from time to time, and the whole history of the movement is well worthy of study. This memorandum will, however, deal only with the present arrangements as applicable to students of the higher primary schools.

In these schools the traveling scholarships are given upon a public competitive examination. The candidates must be between 16 and 19 years of age, and must prove that their parents are unable to send them abroad at their own expense. The scholarships set apart for pupils of higher primary schools are given solely to those who intend to follow a commercial or industrial career, the "general" students (most of whom enter the teaching profession) being sufficiently provided for by the traveling scholarships set apart for members of the staff of normal colleges. The scholarship holders enter as students in commercial schools or general schools in other countries to which they are sent, and sometimes as apprentices or clerks, without pay, in business houses. They are obliged to write monthly theses in the language of the country where they are residing. These are examined by the "comité de patronage," who are responsible in France for the general arrangements of the scheme and for placing the scholars.[1] The scholarships are usually tenable for a year, with possibility of extension. They vary in amount for the different countries where they are held, those in England being much the highest. There are at present three in Germany (Bremen, Hamburg, and Munich) and nine in England (Clifton, Manchester, Birmingham, Exeter, London, Newcastle, and Liverpool). The experiment has been a great success. Thus M. Armagnac says: "If we glance through the correspondence of the scholarship holders from the

[1] Some of the reports written by normal-college scholarship holders have been very valuable, and have been published in the Revue Pédagogique.

écoles primaires supérieures, we find a sentiment which is expressed nearly everywhere under an almost identical form: 'I am treated like a child of the house;' 'I am here in the position of a son;' 'It seems just as if I were one of the family.' And everywhere the intellectual and moral effects are on a par with the material comforts with which the scholar is surrounded. He is encouraged, upheld, and counseled. While he is allowed a great deal of liberty, the company he keeps is watched. He is put into communication with good comrades and respectable families. In fact, in every respect he is treated as a good father would treat him. These are services which can not be forgotten, and for which their authors can not be sufficiently thanked. And while learning the language of the country which receives them the scholars learn at the same time their manners and customs."[1] "I am surprised at the earnestness of your young men," writes the head of an English training college to a member of the committee, and a few days later one of these young men wrote in his turn: "I imagined the English to be the coldest natured people in the world. They seem so at first, but how pleasant they are when the ice is broken. I am loaded with kind attentions and surrounded with friends."

It is intended in the future to send scholars also to Spain, Italy, the Netherlands, and Russia. Already the municipalities have followed the example of the State, and many now set apart municipal funds every year for these traveling scholarships. In 1889 there were as many as 67 pupils of higher primary schools who had been sent to England and Germany by these means.

Social class of the students.—Perhaps the next point of importance in gauging the work of the higher primary school system in France is to discover how far the schools are frequented by the class of children for whom they were intended. The answer to this question must vary to a certain extent with the locality. There are instances where the "well-to-do" classes have made considerable use of the admirable instruction provided in the higher primary schools, but it seldom happens that they are numerous enough to keep out the most intelligent of those who in a pecuniary sense need it more; for wherever there is an insufficiency of places it is open competition that decides admission, so that the cleverer pupils always get in first; and the cleverer pupils of the elementary school have every chance of success, since the subjects and methods of the examination are strictly on the lines of the elementary school upper standard and certificate work.

Moreover, the fact of "gratuité" has an immensely potent social influence in France. By the act of 1881 all "primary instruction" was made free, and by the act of 1886 higher primary schools and apprenticeship schools were specially named as being parts of primary instruction; hence fees may not be charged for the instruction given in them. And in France there is still sufficient "amour propre" of a peculiar kind to prevent any large use of free schools by any social class higher than the "petit bourgeois"—firstly, from a dread of "promiscuité" (i. e., the mixed character of the children who will be found there), and, secondly, from a feeling of social pride, which hesitates to make use of free schools provided out of public funds.

As a general rule, it may be safely said that in the larger towns the higher primary schools are frequented solely by children who enter them direct from the elementary schools, for there is sufficient provision both for preparatory and for higher education in the lycées and in private schools for those who dislike the "promiscuité" of the free higher primary school. But in the provincial districts, where the higher primary school is sometimes the only available means that exists for any efficient higher education for many miles around, and especially where a well-managed "internat" removes the difficulty of distance, a higher social class have

[1] M. Bréal says: "Ils apprennent la Suisse et l'Angleterre, et ils font connaître la France."

learned to avail themselves of the excellent instruction which is there provided without cost, so far as the actual teaching is concerned.

Movement for adult education.—The higher primary schools do not reach the great mass of children whose education terminates as soon as the obligatory course of elementary instruction is completed. The movement for adult education, by means of Sunday and evening classes, lectures, etc., is intended to save such from moral and intellectural degeneracy.

Since the publication of the Commissioner's report for 1894–95,[1] which contained the synopsis of a special report on this movement, a second report has appeared. This shows a continuance of the enthusiasm and of the efforts, public and private, by which the movement is supported.

The creation of adult classes at local expense had been authorized as early as 1850, and State appropriations allowed for them from 1867. Owing to various causes, chiefly the complete provision of elementary schools, these classes had declined, but resting as they did upon a legal basis, their revival seemed to offer the best means of carrying on the work of adult instruction. This provision of systematic instruction is supplemented in the present movement by populuar lectures, profusely illustrated by magic-lantern views, by public readings from standard works, and by the use of public libraries. In his second special report on the movement M. Petit sums up the results achieved in 1896–97 as follows: 24,578 courses of instruction for adults and adolescents in public evening and Sunday classes, 5,000 courses offered by societies, boards of trade, etc., 97,313 lectures, 110 school societies of mutual aid formed, 1,575 associations of former pupils constituted, 648 school "patronages" (societies for the moral and industrial care of youth) formed, 1,200 societies of popular instruction in full operation, 33,000 teachers engaged in the work, and 417,421 youths in regular attendance upon the instruction. Many and ingenious efforts are used to attract the pupils in the first instance. Handbills are displayed; letters sent; visits are made by the teachers; in fact, a regular crusade is conducted. The young people are brought together in a preliminary session. Eloquence and arguments are employed to excite their interest. Once secured, however, the pupils are retained by the importance of the work and the attractive manner in which it is carried on.

It is of interest to note the character of the instruction thus imparted. Here the experience of the older societies is suggestive. The constant increase in the number of their pupils shows the wisdom of combining general culture with industrial or technical training. These societies even go so far as to teach special industries.

The same course is pursued in the classes maintained by chambers of commerce and boards of trade, even in the smaller municipalities. Following these precedents, the endeavor is made to give the public

[1] Vol. 1, pp. 298–305

classes for adults something of the same practical character, and thus they are rooted, as it were, in the life of the community.

The contrast between the present programmes and those formerly offered in the adult classes is indeed striking. They are no longer limited to the three R's or to a mechanical drill in the subjects of the elementary school. Dictation is employed as a spelling exercise, but the matter is selected for its educational value. Short compositions are required, but upon subjects drawn from the daily life. Short lessons are given in a conversational manner on temperance, thrift, civil obligations, business correspondence, etc. Arithmetical problems are related to the local industries. For exercises of this kind no text-books are at hand. They are a perpetual drain upon the ingenuity and intelligence of the teacher. Often the pupils are consulted as to the subjects in which they desire instruction, and their suggestions prove of the greatest interest.

It is generally the case in cities that there is a section for illiterates. Thus M. Petit reports that at Bordeaux he saw masons, their fingers stiffened by the handling of the mattock, making strenuous efforts to manage the pen. Elsewhere he found soldiers who could neither read nor write, and who had been sent to the classes by their commanding officers.

The tendency to give a practical character to the instruction can be best shown by extracts from answers given to the question, What programme has been generally followed?

"Notions of surveying and study of the general plan of land registry (plan cadastral); practical notions of agriculture and of horticulture" (department of Allier). "In the majority of the schools the effort is made to give a very practical character to the courses. Boys are taught surveying and the general plan of land registration" (Basses-Alpes). "Land registry, agriculture, and common law in the rural communes; drawing and the elements of the sciences applicable to industry in industrial centers" (Ardennes). "Contracts, leases, conduct of sales, common law" (Aube). "(1) Notions of rural law, leases, registries, rentals; (2) business letters, claims; (3) surveying, accounts, bills of exchange; (4) fertilization and improvement of land and of stock; analysis of soils" (Indre et Loire). "To fix and extend the knowledge already acquired and to meet the individual needs of students, as specified in the class register" (Nord). Similar citations could be indefinitely multiplied. There are also many examples of special courses, as at St. Nazaire, in the department of Loire-Inférieure, mechanical courses in naval construction, carpentry; at Brest, in Finistère, courses preparatory for the workshops of a military post, etc.

M. Petit advises that, as additional inducements to attend the classes, prizes should be offered, such as medals, books, even agricultural implements, tools, drawing implements, and in the richer com-

munes savings banks certificates and certificates on the pension fund for the aged. Such awards have already been made in several places, notably at Reims and at Havre, the cost being borne by the municipalities or by private benefactors. The moral effect has proved excellent, and the experience of private societies confirms the value of these expedients.

M. Petit favors also some form of certificate for those who complete regular courses, and believes that in time these would be of great use to their possessors in securing employment, and even special favors, with respect to the obligatory military service. The report states that, although the classes for young women have been less successful than those for young men, they also show increase, rising from 966 in 1894–95 to 1,808 in 1895–96, and to 4,429 in 1896–97. Some departments have formed no classes for women; others very few. The departments which stand highest in this respect are Aisne, with 253 classes, and Seine-et-Oise, 153, in the northeast; Haute-Garonne, 191, in the south; and Vosges, 128, in the east. These seem to have nothing in common but a determined spirit for the initiative. On the contrary, the conditions that interfere with classes for women, which, like those for men, must generally be held in the evening, are the same everyhere—household cares, reluctance to go out in the evening without protection, and weariness after the toil of the day. Mixed classes, it should be said, are little in favor outside of Paris. As to the programmes in the classes for women: In addition to general instruction, which, by universal testimony, makes a deeper impression upon young women than upon young men, large space is given to subjects of special value for women. These include domestic economy and hygiene, sewing, cutting and fitting, and housework. It is urged that instruction in cookery, in nursing, and in the legal status of married women would be of great value, but these subjects can be treated more successfully in weekly reunions on Thursday and Saturday than in evening classes.

The funds for maintaining this work in its various departments are derived from private donations, from fees, municipal appropriations, departmental subventions, and from the State. The private donations do not go to the teachers, but are used in the purchase of material. From this source were derived $11,250 in 1895–96 and $38,000 in 1896–97. Fees contributed in the pay courses were reported from 73 departments in 1895–96 to the amount of $11,250; from 81 departments in 1896–97 to the amount of $12,500.

Although there is a gradual increase in pay courses, there is no prospect that they will supplant the free courses. The classes of the population most in need of moral and industrial guidance are those which can not possibly be reached in this way; hence M. Petit concludes that tuition fees do not promise the solution of the financial problem of adult instruction.

The third and most important source of income for the work under consideration is municipal appropriation. From this source in 1895–96 were derived $230,000; in the following year $264,450. In many departments—those, for example, which include no large cities and in which, as is frequently the case, the communes are burdened with debt—very little is realized from local appropriations. The department of the Seine inscribed in its budget for 1896–97 a total of $94,248, of which $50,248 went directly to the teaching force and $44,000 as subventions to societies engaged in the work. In contrast with this liberality the Basses-Alpes allowed only $62; the Hautes-Alpes, $101; Lozere, $40. In addition to the municipal or communal appropriations the departmental councils (conseils généreux) also make grants for the work, which tend somewhat to equalize the resources of the different communes within their respective limits. The amount from this source in 1896–97 was $8,800.

The contributions of the State for the work of adult instruction are made directly to the teachers, who devote themselves to it, and consist of payment in time, decorations, and prizes. The payment in time is made either by prolonging the vacation or reducing the number of hours per day. The latter course is taken only in exceptional cases.

The honors most coveted are the academic palms and ribbons, "palmes d'officier d'académie", of which 60 are offered each year; "palmes d'officier de l'instruction publique," 20 each year. M. Petit urges that these numbers be increased.

THE REFORM OF THE BACCALAUREATE.

[Citations from articles by M. Boutmy; Revue Bleue, April 18 and 25, 1896.]

The baccalaureate, a social institution; sources of its strength and tenacity.—The baccalaureate is violently attacked just now by an élite of bold spirits. It has pronounced enemies outside of the university. It has them also—and they are not less ardent—in the universities themselves. Whatever be the number and the authority of those who lead the assault, I do not believe that the moment of capitulation is near. The baccalaureate has on its side the strongest claim and the greatest force in the world—possession and custom. It has become a veritable social institution. It is incorporated in our legislation. Innumerable regulations make mention of it, and to it are attributed rights and privileges. The imagination of the reformer is troubled, and his arms fall in view of the enormous work of tearing down and rebuilding the public acts of which the baccalaureate is an integral part. Our bourgeoisie would be struck with a sort of stupor if suddenly they no longer saw the beacon that guides them and by which they direct their sons. They would groan like animals after a sudden darkening of the heavens; they would complain bitterly from knowing no longer which way to go.

Moreover, either from instinctive feeling or from reason, two classes

of persons usually arrayed against each other are united in support of the baccalaureate—representatives of free education and, at least in part, the theorists, desirous of ever-increasing interference and control on the part of the State. These, after all, are in possession. They do not care to dispossess themselves; there is too much of the unknown in the substitutes which are offered them; they fear to lose by change and think it safer to maintain existing conditions.

Representatives of free education are attached to the baccalaureate for other reasons that may be summed up in one sentence. The suppression of that examination would restore the complete monopoly of the university (i. e., the monopoly of education by the State).

The faculties of medicine and law, the public service, are the goal of bachelors. They absorb almost the total number produced. The baccalaureate suppressed, nothing will prevent these faculties from deciding voluntarily or upon compulsion that they will admit to their examinations, degrees, or employment only the young men furnished with diplomas from a State lycée. Deprived of their principal outlet, free establishments will be deserted and have nothing to do but shut their doors. The baccalaureate is their protector against such acts of intolerance. It procures for them two considerable advantages: first, a dignified jury whose impartiality is above all suspicion; second, a uniform title that serves as a shield between them and authorities whose enmity they might dread. The diploma of a bachelor, granted by the State on the proposal of a jury of the State, is sufficient and answers for all. There is no occasion to go beyond that and ask about anterior preparations. Thus the baccalaureate, an official test, has become the best safeguard of the liberty of secondary education, and for this reason the representatives of free secondary instruction are its most faithful and earnest defenders. If the monopoly of the university had continued, it is nearly certain that the baccalaureate would have disappeared long ago. The establishment of the principle of common right is what has done most to conserve it; the impossibility of renouncing that régime is the best guaranty of the maintenance and perpetuation of an institution decried or discredited among many good people. The baccalaureate is efficiently protected also by the complexity and the divergence of those interests and rights which must be conciliated by any system that should be substituted for it. It is as difficult to dispense with it as to supply its place. Thus projects of reform have remained for many years in the state of aspiration and dreams. Until a very recent date no competent authority has consented to take the risks of adopting any one. * * *

Class distinctions fostered by the baccalaureate.—I here mention an important fact too often passed over by the most determined adversaries of the baccalaureate. That examination is not merely the sanction of secondary studies; it is an institution of much social and political consequence, and the effect which it produces by this relation

greatly surpasses in extent and importance its pedagogical effects. A century ago we made a revolution to abolish castes and their privileges; now we are indifferent to the fact that the baccalaureate is reestablishing what we have overthrown. It divides the nation into two classes; one having "parchments," the other not having them; one having sole entrance into liberal careers, the other excluded and confined to the old plebeian avocations—commerce and industry. This division takes place about the eighteenth year. The separation is clear and positive. One either does or does not belong to the privileged class, and it is the baccalaureate that determines. The distinction is definite and for life. At that age one does not recommence his entire education. The young man who has started on another line, who has passed, for example, through a school of commerce or one of agriculture, rarely will have the heart to return to his point of departure and consume in elementary studies time which he could more usefully and manfully employ. Without such return he is excluded; no equivalent of merit and of title is admitted. Such an organization is in manifest contradiction with two principles well established—one economical and social; the other juridical and political. The first of these principles is that talents of every order should be left as free as possible to change their places and remove to those for which they believe themselves best adapted or where they can render best service. Only for the most grave and peremptory reasons should this free circulation be hindered. The juridical and political principle is that of the equal admissibility of all citizens to positions without other distinctions than those of virtue and ability. No derogation that can not be fully justified should be allowed from that standard of right, I would go so far as to say, of public order. To found in reason and in justice the privilege of some and the exclusion of others there would be needed nothing less than a criterion of perfect justness, having the measure of all that makes up the value of a man; I mean his physical and moral as well as his intellectual attitudes. The baccalaureate should not be accepted as a means of social demarcation, of qualification or disqualification for the high liberal careers, unless its possessors were one and all, in the opinion of the world, the only, or almost the only, men fit for those superior positions. The world holds no such opinion.

I will show in a moment that even from the point of view of learning and culture the baccalaureate is a very imperfect test; but were it perfect, it would still be an unsatisfactory principle of social demarcation, because it does not reach every man, nor even the best men. Indeed, I know not if the fact of belonging to a certain family would not form a criterion less fallible or a test of classification more sure than the baccalaureate; hereditary transmission of quality of body and intellect, fireside education and examples, and noble obligation to an illustrious name would guarantee an average of physical, moral, and

intellectual aptitudes more surely than that average of learning and ability which the best judge can discover in an examination of a few hours.

We have created, without doubt, a privileged class, and, what is more grave, we have no assurance that the privilege of the new "noblesse" will be much better qualified than that of the old and that society, country, state will really be benefited by the change.

The baccalaureate thus conceived is a veritable social evil; it largely increases the number of the unclassed, and it is the cause of the multiplication of positions without absorbing or satisfying the ever increasing crowd of candidates. * * *

Has the baccalaureate in effect the virtue of diminishing the crowd, the prospect of which terrifies the authorities who dispose of places? I believe not. I even suspect the contrary. We have seen that the baccalaureate effects a sharp division of the nation into two classes, analogous to the "populus" and the "plebs" of the Roman Republic. Hence its importance, worthy of the full attention of a statesman. A young man seeks the baccalaureate not so much that he may be prepared for a career which he has in view as that he may obtain admission into the higher class. Once admitted, the idea never comes to the candidate of engaging in any profession not comprised within those to which his degree gives him access. He would blame himself for having taken so much pains to obtain a title from which he gets no profit; he would believe that he had failed if he made no use of his privileges; if he were, so to speak, to retrace his steps to one of those courses open to nonbachelors. On the whole, the baccalaureate tends to obscure in the mind this verity of good common sense that there is no unworthy employment except that which one unworthily pursues, no inferior profession except that in which one fails of the requirements. It implies between careers a division and a hierarchy, in great part artificial, which in most cases would be effaced if the baccalaureate did not exist or were it differently organized.

We see, then, how the baccalaureate serves to augment the mass of candidates for public employment. If for every employment the number of postulants is multiplied, it is because, first of all, that the number of persons provided with general qualifications is multiplied. The number of candidates, without doubt, would be fewer if their ranks were not increased by crowds of young men who have taken the baccalaureate only to advance themselves socially, and who afterwards find themselves bound by a sort of duty to themselves to choose one of those careers to which their degree admits them as a matter of privilege. Nobody more carefully avoids what is below his rank than he who has been recently raised to it. In short, the baccalaureate, serving as a means of social classification, tends to accentuate among careers an order of dignity in great part arbitrary and contestable, and thus to increase the number of aspirants to liberal

careers; in fine, to prevent the diminution of this number and the thinning of its ranks. I am right, therefore, in saying that it multiplies the unclassed (déclassés).

Description of the evil in respect to that which is most grave and characteristic indicates clearly where the remedy is to be sought. If the baccalaureate seems to divide the nation into two classes, it is, in the full sense of that term, a grade—that is to say, a "unique degree." One does or does not pass the stage, and upon this depends his qualification or disqualification. He is wholly one thing or the other. Everyone belongs either to the portion above or that below this single stage; he is reputed the equal or the fellow of all in the one or the other division. Here indeed is caste. One enters by effort and the chance of a day, even of an hour, by a sort of accident like that of birth. Beginning with that, all is said, all is done; classification by examination allows no other difference, no other alternative. * * *

Difficulties in the way of reform.—A first erroneous conception brings on a sequence of others, and all taken together form a circle from which there is no escape. The fact that the bachelor's degree procures marked advancement in the social hierarchy inspires ambition in multitudes of young men who otherwise would not care for it. Naturally, the more the number of candidates increases, the more decreases the average of capacities by which involuntarily the examiners regulate the average of requirements. The standard of examinations tends to become lower itself, and there is danger lest mediocrities pass it in crowds. To stop this surging wave no better means is imagined than to make examinations more difficult, and for this no better means can be found than to make them more varied. Many times and much, since the creation of the baccalaureate, has it been modified. It has been reduced and divided into series. Through all transformations its programme has changed only to be enriched. At all events the list of subjects has not been shortened. At present the classical baccalaureate comprehends thirteen tests, extending over ten or twelve subjects, including four languages and three literatures, history, geography, philosophy and history of philosophy, mathematics, physics, chemistry, and natural history. The programme of the "modern" baccalaureate is yet more exacting. The idea seems to be that the dignity and convincing force of examination are to be measured by the diversity of subjects and questionings.

All such expedients have been vain. The standard of examination is not elevated, but the contrary, as, in truth, it was easy to foresee. There is a point on which one need not be deceived; we have obtained what we desired, an examination that apparently stands for large culture and has an air of being difficult. It would be so, indeed, if the tests were serious. But to possess and be able to present at a given moment that array of knowledge would suppose in the candi-

date an acuteness and versatility of intelligence or powers of application and labor infinitely beyond the capacity of even an able youth of 18 years. The requirements are more than enough to embarrass young men of the best endowments and make their success uncertain, even though little is required in the different subjects. It is not desirable to expose such to the risk of failure; that would serve to endanger the recruitment of higher liberal careers; therefore the examinations are really made very simple. Thus, the able are sure to pass, but many young men who, for the honor of the degree, should be eliminated, pass also. Incapacity, ignorance, or extreme laziness alone fail. The body of bachelors continues to be a caste, but it is a caste discredited through the feebleness of a king who bestows the honor too lightly. * * * Examiners are, besides, made distrustful of themselves by a sort of confusion that is produced, particularly in Paris, by the great number of examinations and the requirements in each. After they have seen pass before them hundreds of inanities, they lose or nearly lose the sense of the limit below which they ought not to descend. They know no longer how to judge nor whether they judge well or ill. Like the razor long used in cutting the feathers of the goose, they have lost the edge. It is not astonishing, in this state of doubt and obscurity, that the consciousness of authority fails them and they decide not to put an eliminatory note on the record of examinations. The evil, therefore, is apparently without remedy, unless the baccalaureate should undergo an important modification affecting not only its form, but its nature and spirit. * * *

Furthermore—and this is the second truth that the present system fails to recognize—the intelligent, laborious candidate has no need of so many subjects to balance his bad chances with the good, as they say. Let him have five or six subjects, and if he must take more, let those be according to his own election. This would suffice for him to acquit himself with honor. The existing system appears to have been created in favor of mediocrities. At all events, it operates to their advantage. It is for their sake that studies are multiplied, because, having nothing to expect save by hazard, they increase their chances at every additional throw of the dice. * * *

The form of the diploma.—The form of the diploma is an additional cause of dissatisfaction. The parchment bestowed by the minister carries no other mention except that the candidate has satisfied the requirements at examination. All other information is omitted. The 6,000 bachelors who go out every year from our faculties of letters bear the same title, and they can call and believe themselves equal to one another. That nominal equality is most contrary to reality and verity. It is surprising that the State should make itself the ratifier and consent to admit evidence so empty and so false. In its context, as it is at present, the diploma shows only that a mean has

been attained; it indicates neither the elements of which that mean is composed, nor how it has been passed. Take one example only: A candidate in the first part of the classical baccalaureate, on condition of obtaining a mark not even above 15 in other studies, can be absolutely nothing in Greek, history and geography, mathematics, and physics, or know next to nothing of any living language. The diploma leaves the public in entire uncertainty on all those important points. I am mistaken; for since no note, no branch of studies, is inserted in the diploma, the public, as it were, is invited to refer to the programme of examination, and is led to suppose that all of the courses included within that programme have been studied and mastered by the bachelor. Nothing could be more easy than to speak the truth concerning him. It is among the files of examination papers. It is hidden therein with care, and it is with deliberate purpose that one is denied precise and significant information that would be of service. The differences between one bachelor and another as to scope and character of acquirements may be enormous; not less enormous, frequently, is the range of difference resulting from the indulgence or severity of juries at Paris and in the provinces, all of which disappears under the deceptive, absurd commonplace of a uniform diploma. To this the State is resigned and is encouraged to be at once dupe and deceiver.

The foregoing considerations place us in the presence of a perfectly clear alternative. Either the State should refrain from interference and leave to every one the charge of verifying capacities, or else it ought so to provide that the title bestowed by it be of signification strictly exact and minutely precise. The best way to acquit itself of its responsibility would be before all to attest to ascertained facts—that is to say, indicate explicitly the subjects really known by each bachelor. That condition would be complied with if it were the rule to include in the diploma the subjects on which the candidate has given satisfactory answers, and those subjects only. An examiner who easily suffers himself to raise the mark of a candidate so as to allow him to pass would hesitate to do this if such indulgence should have as a consequence certification upon the diploma bestowed that the bachelor had mastered a subject of which he was ignorant. The more of seriousness in examinations and sincerity in notation the more the convincing value of the diploma. There are two considerable gains, and enough to make the qualified baccalaureate which we propose of greater signification and merit than that now in existence. Optional studies mentioned in the diploma would add further indication. They would furnish a more precise and individual characterization of the intellectual tastes of each candidate. As to the marks "good" and "very good," they would serve to distinguish and make clear among the multitude of bachelors those who are leaders—a number not very numerous, but constituting a veritable élite. Effective

division into two categories, if it were made, would have this result. It would not separate bachelors from nonbachelors, but capable bachelors from the ordinary and mediocre. It would distinguish from the mass not all that pass, but only those who pass well. For the persons, the faculties, corporations, and administrations that have to pronounce upon the admission of bachelors to certain employments, studies, and examinations, the baccalaureate would cease to be a vain, commonplace, and well-nigh insignificant recommendation upon which no reliance can be placed. At present it is nothing else. It would become a means of information, a sort of "état descriptif," which might be made as explicit, as exact, and as complete as possible. It would give information to the proper authorities as to the general competency, qualification actually acquired, direction of intellectual tastes and vocations, and would thus facilitate a more judicious distribution and adaptation of candidates for different careers.

The effect of the diploma upon the studies.—I promised myself not to touch upon the direct effect of the baccalaureate on studies, but without contradicting my purpose I may consider the action at a distance that the prospect of examination exercises on the formation not only of the intelligence, aptitudes, and tastes of the students, but of his character—by which word I mean constitution of will, habitudes that serve as its point of support, springs from which it receives impulse. Of the two, character is assuredly the most important, for if it is energetic and its aims are elevated it furnishes to a man the force and the tenacity necessary to subsequent completion of insufficient education, and in case of need it alone will create for him beautiful ideals of a useful and honorable life. To make clear that capital question, one must consider what constitutes the moral worth of a man. That worth results from and depends upon the habit, slowly and gradually contracted, of looking at life, its surface and its depths, and regarding it down to its close as a series of obstacles to be overcome, of duties to be assumed and performed. That habit can not be formed unless at the age when he was capable of understanding them a man has had a prospect, direct, clear, and open, of the greatest, noblest realities in this world, if education, far from interposing any obstacle between them and himself, has not been devoted to bringing them freely and largely into view. Defense of country, its colonial expansion, development of a branch of human science, free exercise of creative intelligence in philosophy and art, active energy in a profession, are all examples of these actualities. The highest aim of all pedagogy is to so dispose everything about a child that he can see these without effort, in a manner direct and more and more distinct. Upon this condition only will it become natural to him, and, as it were, spontaneous, to incorporate himself with those noble ideals, there to mingle and enlarge his own paltry personality, to feel within himself somewhat of their grandeur and follow their conserving law in prefer-

ence to his own self-interests. To keep constantly before the eyes the vast horizons of life, peopled with collective existences greater than one's own, to grow to admire and love them, to accustom oneself if possible to accept as a blessing, to regard as a sovereign goal the sacrifice that one may make of his personal satisfaction—this, in its last analysis, is the substance of all morality.

These "optical" conditions, if I may so call them, of all moral education the baccalaureate suppresses. Between the child and that vast horizon that it is so important to open before him it raises a barrier that intercepts the view, a low door and an archway through which he must pass for a price before meeting the divergent routes of manful activity. Instead of disentangling him entirely and moving him unconsciously by the life whose contemplation makes a young man a valiant soul, and by those abstracting, distant prospects which excite and exalt his imagination, and those grand creations of reason—country, sciences, arts, dignity of manhood, duty of a citizen, professional honor—sublime figures, veiled only by a distance that the course of years gradually diminishes—his attention is claimed, lowered, and closely fixed upon an object purely arbitrary and artificial, which responds to nothing in life—an obstacle, a sort of steeplechase, or, as I have said, a tollgate or a turnstile—and upon compulsion he spends his time in collecting and getting ready his money. Then he loses all chance that he had of perceiving great impersonal objects, of interesting himself, of attaching himself to them, to make them enter into the perspectives of his future. Of commerce he receives a selfish ideal, which excites within none but egotistic thoughts and constantly occupies his mind with a calculation of chance or with petty recipes and practices of a nature to achieve success. In that order of ideas examinations and competitions for entrance into different careers, however narrow and positive they may appear, are not like the baccalaureate, demoralizers; they open at least one way to a certain type of useful life, embracing a number of duties. For those young men destined to a military life—in the Navy, for example—thoughts and dreams of the future are rich enough in idealism to satisfy the most exacting moralist. In the baccalaureate the ideal and the real fail simultaneously; everything is arbitrary, factitious, commonplace, transient, without any connection with positive, substantial ideas that the young may form of the life awaiting them. That which is placed in perspective at the end of their studies is less an end than a barrier to be overleaped or to be turned by force or address, and this end, unceasingly recalled by the nervous anxiety of parents, is made yet more mischievous by their commentaries. * * *

It is vain to say that most young men do not look so far before them; it is at least necessary to afford them the opportunity. They should get a glimpse of, sound, and divine the great realities which every

year brings near to them. That alone would be an inestimable blessing, and more than abundantly compensate for the sacrifice of an artificial and injurious stimulant. The direct action of the baccalaureate on the moral and intellectual future of a youth appears not less harmful from another view. If there is one incontestable truth, it is that the benefit of secondary education is not measured by the acquirements which a youth may prove himself possessed of when he leaves college, but by all the acquirements which that instruction has put him in the condition and disposition to make in after life. The total result at 18 years, after eight or ten years at school, is necessarily inconsiderable, unstable, soon fading, and, one may say, of the least value compared with the total that may be attained during thirty or forty years correspondent to the period of full maturity. That which is important is the long after work and its results; that which ought to count in the first education is what prepares and disposes a youth to regard the cultivation of his understanding as a work only commenced, and to pursue it as one of the ends constantly proposed for his manful activity. At present, as conceived and organized, the examination tends more or less by its effect upon the imagination, against which it is impossible to guard, to subdue and destroy the natural curiosity of the mind, to dull the edge of stimulants that support and keep it renewed, and, in fine, to diminish the sum of general culture in the majority of individuals. * * *

In conclusion I will limit myself to expressing the profound conviction which conscientious study of the question has served only to strengthen. Secondary studies have no need of the baccalaureate; they have only to gain by being independent, by drawing from themselves alone their force, their attraction, their credit. If the lycées on that account lose a portion of their clientele, that is precisely the portion which it is desirable to see turn from them. They lower the standard of education and the moral tone of youth. The baccalaureate "ordinaire" being estimated at its true worth, would be very modest, and when opening no other door except for one who has passed very well, or who has added certain special matters that he has really mastered, would no longer be the only goal for ambition. It would then seek its natural course; it would turn alike to the higher primary or technical schools; better yet, it would push out into practical life, which, we often forget, is also a school.

THE ASSOCIATION OF GREEK STUDIES.[1]

[Address by Michel Bréal.]

GENTLEMEN: In calling me to the honor of presiding over this great society you have desired to indicate your appreciation of one who has been among its friends from the beginning. There are no longer very many of our confrères who, one day in the year 1867, met at the house of M. Gustave d'Eichthal, in order to lay the foundation of our association. You may not know, perhaps, what was the immediate cause of that meeting. It had been bruited abroad that Greek studies were menaced in our institutions of secondary education. At that news a certain anxiety was felt by the friends of Hellenism. Egger, Brunet de Presle, Beulé, d'Eichthal (I mention only those who have since deceased), resolved to protest. Fortunately, the rumor was ascertained to be false, and it could not have been otherwise with a minister of public instruction like M. Duruy, who, while improvising with keen sagacity new creations that had become indispensable, scrupulously conserved all that was best in the university patrimony. Besides, with the best grace possible, he gave proof of his favorable disposition toward Greek, for he made haste to enter the association wherein his name figures as one of its founders.

No less impulse was given also for another reason. As the cause of Greek studies was, on the whole, the cause of higher education, as it was dear to all cultivated minds, new members were not slow in coming. Men of the world enrolled themselves in great numbers, regarding their adhesion as a duty and an honor. At the end of the first year we were more than four hundred. These figures were doubled at the end of the second year. I know of few associations whose increase has been so rapid. We must conclude that this was a response to the aspirations of the best representatives of our French society.

More than once, since Henri Estienne, has been pointed out the conformity of French with Greek genius in one and another respect. We are conscious of that relationship the more sensibly since the progress of studies has removed the veil of respect, somewhat superstitious, by which epochs of imitation had obscured the image of primitive Greece. Thanks to the researches of history and archæology, thanks also to the increased facilities of travel, we are to-day nearer to that primitive Greece than we have ever been. It may be that students in our colleges are not more familiar with the Greek language than were their predecessors at the period of the Restoration and of Louis Philippe; but this is certain, this which impressed me more than once within these last years, that Hellenic genius has

[1] The Association for the Encouragement of Greek Studies in France held on Thursday, June 3, their annual public session. On that occasion was heard the Second Hymn of Apollo, sung by an artist of great talent, Mlle. de Klin. We reproduce the discourse pronounced by our colleague, M. Michel Bréal, president of the association. (Revue Bleue, June 12, 1897.)

become more generally understood—has grown more popular. At classic matinées in our theaters I hear young girls giving their impressions of a drama of Æschylus or a tragedy of Euripides. Excavations from Delphos, from Delos, attract to the Louvre or to the School of Fine Arts crowds of the elegant and curious. Through the statuettes of Tanagra, Greek sculpture is taking its place in our salons. Even Greek music, as we may perceive in our own time, affords French men and French women artistic emotions of which our ancestors could have had no anticipations. This is not all. We have seen the Greek dance, with movements that have nothing of the academic, become a subject of discussion among professors at the Sorbonne.

One fact summarizes this whole progress. This year, at news of the fêtes which were to celebrate the fiftieth anniversary of the French school at Athens—fêtes that unhappily events have prevented or delayed—such a concourse of visitors was announced that the event began to assume the proportions of a national commemoration. Thus to the Greece that was little admired and revered beyond its own borders has succeeded a Greece better known, with whose life, whose habits, and whose customs we have become familiar, and which we admire more since we know them more intimately.

Since it has pleased you to place in the president's chair a philologist, it will seem to you natural that he should not ignore the Greek language. You will not reproach me, I hope, if I conduct you for a few moments to the past, since the present moment for those who love Greece is not without sadness. We shall return to it presently, if you will, after we have been comforted by a view of all the wonderful things of that favored land, yet destined, I have no doubt, for a long and glorious future.

The Greek language has undergone that sort of change which consists alike in bringing it nearer to ourselves and in stripping it of that which is extraordinary and unique. It no longer seems to us as a miracle; as a sort of divine word created by the genius of Homer and the Oracles. We know that it had, as it were, a cortège of sisters which, after a fashion more or less exact, recalls its traits. We know that many centuries before there was a Hellenic people that language was already in possession of a great portion of its riches; but since science has replaced it in the environment in which it grew, we see more distinctly all that it has added to its primitive foundation, and also all that it has had the good fortune to preserve. We see how it has fructified its part of the heritage, and how it has filled up from its own spirit the forms that otherwise would have remained useless or inanimate.

Let me mention two special felicities which, in my opinion, are attached to the Greek language, and which have made it—

> "Ce langage sonore aux douceurs souveraines,
> Le plus beau qui soit né sur des lèvres humaines."

One of these felicities was to have an epic poetry, a lyric, a theater, historians, orators, long before a grammarian was born. That is a rare felicity; for if you turn your eyes to other languages, you will note that nearly always grammar has been in advance of literature, or, at least, that the earliest writers had before their eyes and in their minds the writings of a former age, words and constructions of another language, that served them for guidance and rule. To the absence of all imitation, all constraint, is to be attributed that ease of movement, that grace which is not conscious of itself, whose charm it is more easy to find than to explain. We may say of it what Sainte-Beuve somewhere said of modern romance, that it had the good fortune to escape the rules of Aristotle, Horace, and Boileau. "It has never been imprisoned, and has known no other discipline than that which is natural; one may say that it grew up in full liberty." The same is true of the Greek language. It astonishes us constantly by its unexpected turns, its liberty of syntax, by phrases which in other languages would seem impossible or inexcusable. But the legislators came too late; its constructions have passed for authority, have received learned names, and been proposed as exemplars.

The second felicity of the Greek language is that, for a long time, no one dialect gained precedence over neighboring dialects and became the official language. On the contrary, with a liberality that has never since been seen, the Greeks of separate states, separate commonwealths, were mutual borrowers; the Athenians employed in the lyrical strophes of their tragedies the Doric dialect; Herodotus, though a native Æolian, wrote his histories in the Ionic. We see how that free exchange enriched its language, multiplied the resources of its poetry, added to the number of those turns which carry with them, as it were, the perfume of the native land. A lesson this for modern peoples to consider and one which I would commend to the Hellenes of to-day, who, while fixing their language, as is proper, would be wrong to exclude what the popular speech of the several divisions may offer that is racy and expressive.

I need not say that these two happy circumstances would have served little purpose without the genius of that wonderful people. Thanks to that genius in times the most ancient, the language is full of expressions which speak to the imagination and which, like the eyes in some portraits, seem to make luminous the objects around them. Solemn or familiar, the Greek language has all tones; the instrument, without effort, is found always worthy of those who have touched its strings to music.

I might add that one can not love the ancient Greek without having some tenderness for the modern, which, whatever some may say of it, has preserved many traits of resemblance to its ancestor. Yet it has not had the same felicity. When it lifted the stone from the tomb and began to take its place among the living, models were not

lacking. It found so many things to guide it that its own originality has been impaired. But it is only just to leave it time to recover itself. It will find its way to lie between those who would force it to remain a simple patois and those who would too soon impose upon it the uniform of our old European tongues. When we recall the time and effort necessary for the formation of French, English, or German, it must necessarily be very unjust to taunt the neo-Hellenic idiom with its first irresolute attempts.

It is characteristic of our association that since the first day of its existence it has united in the same spirit of union and concord admirers of ancient and the most distinguished representatives of modern Greece. Other nations have done as much as France for the advancement of learning, but one will not readily find elsewhere that fraternity which has joined in one purpose the sons of the Hellas of to-day and the disciples of ancient Greece. If you run over the list of our confrères you will notice their names mingled throughout its pages. Only last year we had for president M. Démétrios Bikélas, one of those men who by force of character, patriotism, and dignity of life do honor to the nations to which they belong. In the list of those who have died this year and whose loss we mourn will be found the same commingling.

After noticing a number of distinguished members who had deceased, M. Bréal thus proceeds:

And now how shall I avoid speaking of that which is present in our minds, and which weighs upon our hearts and consciences? It is not for me to recur to the beginnings of a conflict which, without doubt, it would have been possible to prevent, a conflict whose issue in other times could not have turned to the detriment of Greece. To him who compares Europe of 1897 with the Europe of 1827 there is no place for pride nor felicitation at the new orientation imposed by the diplomacy of the great powers. Yet, whatever be the present exigencies, while making proper allowance for circumstances and without pretending to judge the situation, which in some points escapes our examination, we have the right to lift our thoughts higher, to put ourselves at a point of view more elevated, which will be also the point of view of history.

The war which we are witnessing is an episode in the conflict of a century. The lot of the people of Greece, since the earliest times of their history, has been to confront the pressure and menaces of the East. Situate at the extremity of Europe, facing the continent of Asia, that small country—the memory is of yesterday—has been the advanced guard and the savior of civilization. Nothing that we possess, nothing in our associations, nothing that contributes to the dignity and value of our life, nothing of all these would have existed if Greece had not, by an immortal heroism, confronted in bygone times an enemy twenty times superior in numbers. Nor is this all.

It proceeded afterwards to find within itself, not for the pleasure of finding, but for bringing forth, all the acquisitions and treasures of its genius. Can we then complain of Greece if she has recognized her destiny in that behoof, if she has always held herself ready to renew the same combat, and if, as was said long ago by the poet Aristophanes, she has not the habit of counting the numbers of her enemies?

Destiny, for the time, is against her. She is vanquished; she has also the mortification of undergoing a concert of remonstrances. It would have been more generous to have spared her this humiliation. Eye-witnesses professing to be impartial affect to hold an equal balance between the two adversaries. But it is not fitting now to compare the personal virtues of the Ottoman subject with those of the Hellenic citizen—a comparison always delicate, always difficult, and which easily becomes delusive in arbitrarily choosing types. For the present, let us regard the two nations side by side. Then what do we behold? On one side we have a small nation that within seventy years has created a town like Athens, open to all the sciences, all the arts, where one feels himself to be in a complete European capital; on the other hand a vast, somnolent empire, which in four hundred years has produced neither an artist nor a writer, and which never rouses from its lethargy but to appall the world by the cruelties of a former age.

Between these two antagonists the ultimate choice of Europe can not be doubtful. Despite the anguishing trials of the present, the future is for civilization. The close of the nineteenth century will not witness the humiliating spectacle of a return of power conceded to Mussulman despotism in Europe.

But, before we conclude, the friends of Greece may address to her one last word. We do not doubt her, and as we have confidence in her, we say to her that she should be ready with an ample provision of energy, for she must prepare for another struggle, more formidable in one sense than that of yesterday—a peaceful struggle, where the victory will be for the most intelligent, the most laborious, for the one that is most a master of itself. Close neighboring to the Hellenic peninsula are nations young, ambitious, aspiring to the patronage of the great powers. It is here that thoughtful Greeks of to-day should direct their attention. If they wish to keep for themselves the resources with which nature has endowed them, they should not hide them from their rivals. May they make more and more fruitful those gifts of activity and intelligence characteristic of the Hellenic race. It is often that on the morrow of catastrophes come periods of progress and abundant development. We say, therefore, to the patriots of Greece, "Let not your hearts abide in sadness. Have faith in the future. Justice is there." *Πενθεῖν οὐ χρή, νέμεσις γάρ.*

CHAPTER III.

EDUCATION IN DENMARK.[1]

TOPICAL OUTLINE.—Population and administration.—Earlier presentations.—General features of the school system.—Schools of Copenhagen.—Rural schools and those of other cities.—People's high schools and agricultural schools.—Secondary schools (includes statistical presentation of growth of real schools as compared with the classical schools).—The University and special schools.—The teacher: preparation for position; associations and conferences.—Historical data.

AUTHORITIES CONSULTED.—Love og Expeditioner vedkommende Kirke og Skolevæsen.—Statistiske Meddelelser om Skolevæsenet i Danmark. (Udarbejdede i Anledning af det syvende nordiske skolemøde i Stockholm, August, 1895.)—De gældende Retsregler for det höjere Skolevæsen i Danmark, ved A. P. Weis og H. Hage.—Slöjdsagen i Danmark: Aarsberetning, 1886–1895.—Vor Ungdom, 1892–1895.—Deutsche Zeitschrift für ausländisches Unterrichtswesen, Jahrgang I, Heft I–II.—Oesterreichischer Schulbote, Dezember 1894.

INTRODUCTORY STATEMENT.

Constitutional monarchy; area, 14,124 square miles; population, 2,185,335 in 1890; capital, Copenhagen; population (without suburbs), 312,859; minister of ecclesiastical affairs and public instruction, V. de Bardenfleth; chief of the division of education, A. F. Asmussen; chief of the royal archives, A. F. D. Jörgensen; chief of the royal library, Dr. C. W. Brunn; chief of the Museum of Antiquities, C. F. Herbst; director of the Academy of Fine Arts, F. Meddahl.

The liberal constitution, based upon a charter of June 5, 1849, was modified and revised in 1855, 1863, and 1866. The executive power is vested in the King, with eight ministers as aids; acting in conjunction with the King in carrying out the laws is the Rigsdag (the Landsthing og Folkething). Denmark is divided into provinces, varying in size from 221 to 9,597 English square miles; there are 18 counties (Amter), subdivided into 60 districts and numerous school districts—2,399 in 1867; of these, 1,081 in the islands and 1,318 in Jutland. The seven provinces correspond to the church dioceses, and religious affairs are under the superintendence of bishops, although there is toleration of all creeds.

The State religion is Evangelical-Lutheran, and 99 per cent of the population belong to that church, of which the King must be a member. The centers of population, Copenhagen excepted, are the 66 cities (Kjøbstæder). The principal cities are Odense, on the island of Fionia; Helsingfor, in Seeland; Aarhus, Aalborg, Randers, and Horsens in Jutland, and Viborg. In Denmark proper the town population increased from 515,758 in 1880 to 663,121 in 1890, or 28.7 per cent; the rural population increased from 1,453,281 in 1880 to 1,509,084 in 1890, or 3.77 per cent. With a population in 1890 of 2,185,157, the pupils enrolled in city and rural schools numbered 231,940, or about 10 per cent of the population. In 1881 the illiterates to 100 recruits numbered 0.36.

GENERAL FEATURES OF THE SYSTEM.[1]

The schools, an establishment of the State, with a required attendance of all children between 7 and 14 years of age, are divided into elementary grades of two kinds in the larger cities, namely, pay schools (Betalingsskolerne) and free schools (Friskolerne). In the country they include ambulatory schools and people's higher and agricultural schools (Folkehøjskoler og Landbrugsskoler), the last mentioned being a continuation of the common schools (Almueskolevæsenet) of rural districts. Then there is a connecting link—the burgher school in the cities—leading to the secondary grade ("Real" and "lærde" schools). The former prepare for practical life, the classical divisions for the uni-

[1] The school system in detail is presented in the report of the Commissioner of Education for 1889–90, pages 519 to 548. The main facts are here reproduced, with statistics to date of 1893–94.

versity. The normal schools (Seminarier) prepare teachers for desired positions. The special schools include polytechnic, veterinary, agricultural, and navigation schools. There are also schools for the defective classes.

As in the other Scandinavian countries, religious instruction is a main element in the schools and the clergy exercise parochial and general supervision over all educational institutions.

At the head of the school system is the minister of ecclesiastical affairs and public instruction,[1] to whom the bishop of each diocese reports annually concerning educational affairs of this diocese. An inspector-general for the whole Kingdom in charge of music and an inspector for gymnastic training complete the list of higher school officers, who, by means of the reports forwarded to them by local officers, are kept advised of educational affairs throughout the Kingdom.

In each rural commune or parish and in each town the administration of public schools is in the charge of a school commission.[2] Outranking the school commission in each district or subdivision of the county is the school board.[3] The school council (Skoleraad) of each county[4] and the county school board (Amts skoledirektion), which comprises the school boards of the district, have control of the financial side of educational affairs.[5]

In Copenhagen the school board includes the mayor, a member of the aldermanic council, and an ecclesiastical functionary designated by the minister of ecclesiastical affairs and public instruction.

A director, or inspector, who is a consulting member of the school board (composed of three members), is especially charged with all that concerns the administration of the schools. Each of the wards of the capital has a school committee of three members.[6] Each public school has an inspector, who is a teacher. He has fewer hours of recitation than his colleagues and receives higher pay. His special duty is to look after absentees and to notify the parents of such negligence.

---

[1] In this ministry there are two sections—the one for supervision of ecclesiastical affairs, elementary and normal schools, blind and deaf-mute instruction; the other for the supervision of secondary and higher schools, libraries, museums, and academies.

[2] Composed of the pastor, as presiding officer, and two members appointed for three years by the communal council.

[3] This includes the sheriff (Amtmand); the district provost, or first ecclesiastical dignitary; and a third member, designated by the county school council. It generally appoints teachers and arranges the programme of studies, although teachers are allowed much freedom of action.

[4] Composed of the members of the county administrative council (Amtsraad) and of several members elected by the towns or cities.

[5] From Love og Expeditioner vedkommenden Kirke og Skolevæsen.

[6] These are a clergyman appointed by the minister of public instruction, a member elected by the communal council, and a third member appointed by the school board.

The law of 1814, upon which the school system is based, makes it obligatory on all parents that children attend school or receive home instruction. Fines or imprisonment are imposed upon parents or guardians for non-enforcement of this law. The State requires each commune to be provided with suitable accommodation for all children of school age, gratuitous instruction being given to those who can not afford to pay tuition fees. The expenditure per inhabitant for elementary instruction averages about $1.54 throughout the Kingdom.

For the maintenance of schools there are various agencies. Finances, as they pertain to educational affairs, are subject to the control of the minister of public instruction. The main support of elementary schools depends upon county or district funds, with governmental subsidies for stated purposes. Normal schools are maintained by State funds. Secondary schools and the university have their own funds, and are independent of the annual amounts voted for the ministerial budget by the Rigsdag. The necessary funds for construction and repairs, heating, purchase of school material, and for teachers' salaries in the elementary schools are voted by the district or communal authorities. The annual increase in teachers' salaries, their pensions and those for the widow and orphan, are paid from a county school fund, which also supports people's high schools, drawing schools, etc. This fund, formed by an annual subsidy from the State and from revenues from taxation and contributions, is divided among the counties, and is under direct control of the county school board and the school council. The former meets annually to determine the required amounts for the ensuing year; the latter sanctions its decisions if favorable thereto.

A statement in tabulated form of the expenditures for different years indicates the total amount in the schools of Copenhagen, in other cities, in county schools, and in parishes during the years 1880 through 1889. The average for a five-year period, expressed in dollars, permits one to observe the increase in every class of expenditure except in extraordinary expenditures for parishes and commercial centers, but this may be explained by the tendency of the population toward centers of civilization, like cities, where there are special objects of study in view.

[Amounts expressed in crowns. The crown is valued at 26.8 cents.]

SCHOOLS OF COPENHAGEN.[1]

The finely developed school system of Copenhagen forms a general model for all schools of Denmark. The free and pay schools (see table below) of elementary grades controlled by the school board had

[1] The presentation for the schools of Copenhagen and for the whole of Denmark is taken from the "Statistiske Meddelelser om Skolevaesenet i Danmark, Kjøbenhavn, 1895," which was prepared for the seventh meeting of the General Teachers' Association (of Sweden, Denmark, and Norway), held in August, 1895, in Stockholm. This association meets every five years in one of the three capitals. The statistics for Denmark are more complete than at any previous period, and hence are quite fully presented in this essay.

33,000 pupils in the year 1893 (16,778 boys and 16,222 girls); in private schools, 7,276 (boys, 2,499; girls, 4,777). There are separate classes for boys and girls, although in the free schools and in the three lower classes of pay schools the sexes are educated together, but they are again separated in the higher classes. Each class—from 30 to 35 pupils—has its male or female teacher, each school its inspector or inspectress, or vice-inspector or vice-inspectress, whose duty it is to see that the school-board regulations are carried out. In 1893 the programme of study comprised religion, Danish, mental exercises, German, history of Denmark and universal history, geography, natural history and natural sciences, mathematics, reckoning, bookkeeping, writing, drawing, singing, gymnastics, and manual training. A marked increase in pupils in the public schools of Copenhagen is noticeable during the forty years (1850–1890), as compared with private schools (see Table 2). Reckoned in per cent of population there were in the various years:

Year.	Public schools.	Private schools.	Total.	Year.	Public schools.	Private schools.	Total.
	Per cent.	*Per cent.*	*Per cent.*		*Per cent.*	*Per cent.*	*Per cent.*
1850	3.03	5.3	8.33	1880	5.89	4.66	10.55
1860	3.78	4.77	8.55	1890	9.12	2.62	11.74
1870	5.24	5.53	10.77	1893	10.15	2.24	12.39

Thus it will be seen that, as compared with population, there was a gradual diminution of students in private schools and a threefold increase in attendance upon the Copenhagen public schools. The statistics in pay and free schools are here presented:

Year.	I.—Public schools.	Boys.		Girls.		Total.		Pupils to a class.
		Classes.	Students.	Classes.	Students.	Classes.	Students.	
1850	Pay schools	42	1,643	30	1,220	72	2,863	39.8
	Free schools	12	495	13	584	25	1,079	43.2
	Total	54	2,138	43	1,804	97	3,942	40.6
1860	Pay schools	48	1,900	36	1,413	84	3,313	39.4
	Free schools	32	1,326	29	1,217	61	2,543	41.7
	Total	80	3,226	65	2,630	145	5,856	40.4
1870	Pay schools	65	2,570	61	1,930	126	4,500	35.7
	Free schools	63	2,503	62	2,487	125	4,990	39.9
	Total	128	5,073	123	4,417	251	9,490	37.8
1880	Pay schools	99	2,965	90	2,654	189	5,623	29.8
	Free schools	133	4,270	126	3,945	259	8,215	31.7
	Total	232	7,239	216	6,599	448	13,838	30.9
1890	Pay schools	165½	5,040	150½	4,548	316	9,588	30.3
	Free schools	308½	9,680	298½	9,271	607	18,951	31.2
	Total	474	14,720	449	13,819	923	28,539	30.9
1893	Pay schools	172	5,514	160	4,989	332	10,503	31.6
	Free schools	370½	11,264	360½	11,233	731	22,497	30.8
	Total	542½	16,778	520½	16,222	1,063	33,000	31

In order to more thoroughly understand the private-school grouping during the years 1850–1893, the statistics for private schools of Copenhagen of different kinds are tabulated:

Year.	II.—Private schools.	Students.		Total.		Pupils to a class.
		Boys.	Girls.	Classes.	Students.	
1850	Schools supported by their own funds	305	316	26	621	23.9
	Schools having funds, but aided by societies	745	873	67	1,618	24.1
	Schools supported by students' fees	2,228	2,434	335	4,662	13.9
	Total	3,278	3,623	428	6,901	16.1
1860	Schools supported by their own funds	352	341	33	693	21
	Schools having funds, but aided by societies	1,161	897	82	2,058	25.1
	Schools supported by students' fees	1,968	2,667	286	4,635	16.2
	Total	3,481	3,905	401	7,386	18.4
1870	Schools supported by their own funds	513	610	49	1,123	22.9
	Schools having funds, but aided by societies	1,157	932	96	2,089	21.8
	Schools supported by students' fees	3,012	3,701	445	6,803	15.3
	Total	4,682	5,333	590	10,015	17
1880	Schools supported by their own funds	468	573	53	1,041	19.6
	Schools having funds, but aided by societies	585	756	68	1,341	19.7
	Schools supported by students' fees	3,701	4,875	531	8,576	16.2
	Total	4,754	6,204	652	10,958	16.8
1890	Schools supported by their own funds	383	351	38	734	19.3
	Schools having funds, but aided by societies	982	821	97	1,803	18.6
	Schools supported by students' fees	1,467	4,165	366	5,632	15.4
	Total	2,832	5,337	501	8,169	16.3
1893	Schools supported by their own funds	381	360	38	741	19.5
	Schools having funds, but aided by societies	1,114	805	99	1,919	19.4
	Schools supported by students' fees	1,004	3,612	327	4,616	14.1
	Total	2,499	4,777	464	7,276	15.7

The gradual increase in students in these years was followed by an increase in teachers, especially in those who had received normal-school training. In 1860 there was 1 teacher to 47 pupils; in 1893, 1 to 36 students. Women teachers increased from 14 to 504; men teachers from 111 to 425.

General regulations appertaining to teachers are as follows: By law of July 25, 1867, a commission composed of eleven members, appointed by the Government, attends to the examination of persons who desire to obtain a teacher's position. Such persons must present themselves for examination, whether they have received the diploma of a normal school or not. This commission meets annually in Copenhagen and in two other cities of the Kingdom. The teachers are usually appointed to the elementary grades by the school board of the district, according to the suggestion of the communal council and the bishop. The public elementary school-teachers in Copenhagen are reported in the different years according to the examinations which they have passed, and it is interesting to observe the growth of the normal-school idea

by the increase from 21 to 257 of those passing such examination since 1860.

Year.	Theological examination.	Examen artium.	Other scientific examination.	Normal-school examination.	No examination.	Not given.	Total.
1860	40	3	14	21	a33 (14)	.....	111
1870	44	.....	19	34	41 (19)	.....	138
1880	36	.....	18	81	65 (51)	1	201
1890	33	.....	25	215	97 (83)	5	376
1893	40	.....	21	257	104 (95)	3	425

a Drawing, singing, and gymnastic teachers are included in the parentheses.

Given the number of pupils in the years 1860–1893 in the Copenhagen schools, it is interesting to observe the salary given. The largest salary for women teachers is 1,600 crowns ($428); the highest salary for men is 3,900 crowns ($1,045). In the early years the greater proportion of teachers received 1,000 crowns ($268), while in 1893 the amount of $428 was paid to the greater number of both men and women.

MEN TEACHERS.

Year.	Total number of pupils.	Having permanent places (salary in crowns).														Teaching by the hour (timelærer).			Special teachers.			Total.

RURAL SCHOOLS AND THOSE OF OTHER CITIES.

The different laws which have governed the schools throughout Denmark are referred to later under historical data, and were cited in the report of the Commissioner for 1889–90, pages 520–522.

The foundation of the common school (Almueskole) was by law of 1814, which gave children between 7 and 14 years of age the right to gratuitous instruction in the common schools.

The gradual growth of the school system for Copenhagen and other cities was referred to in the above-mentioned report, but statistical information for rural districts, as well as for some cities, has been lacking, owing to the fact that the educational authorities had not for years collected such information. From the "Statistiske Meddelelser om Skolevæsenet i Danmark," published in Copenhagen in 1895, the following detailed and comparative statistics are taken. The number of children of school age in rural districts (including commercial centers or trading stations) were:

	1867.	1893.
In Seeland and Bornholm	59,676	72,841
In Funen and Laaland-Falster	37,085	40,027
In Jutland	103,300	130,769
Total	200,761	243,637

In accordance with the attendance or nonattendance in public or private schools, the figures read thus:

	In 1867.			In 1893.		
	Taught in public schools.	Taught in private schools.	No instruction.	Taught in public schools.	Taught in private schools.	No instruction.
In Seeland and Bornholm	53,125	5,098	1,453	60,065	12,603	173
In Funen and Laaland-Falster	35,022	2,056	617	35,743	4,187	97
In Jutland	96,051	6,840	499	118,589	11,870	310
Total	184,198	13,994	2,569	214,397	28,660	580

Thus it is seen that an increase of 16 per cent of the school population was instructed in public schools; in private schools it doubled; the number not under instruction was only about one-fifth as large as in 1867.

The following is the school population in Kjøbstæderne (seaports, market towns, or cities):

	1867.	1893.
Towns on the islands	18,540	29,122
Towns in Jutland	15,096	30,527
Total	33,636	59,649

Of this number those receiving schooling and those receiving no instruction were:

	In 1867.			In 1893.		
	Taught in public schools.	Privately instructed.	Having no instruction.	Taught in public schools.	Privately instructed.	Not instructed.
Towns on the islands *a*	12,773	6,055	Not given..	20,644	8,406	72
Towns in Jutland	10,579	4,354		21,565	8,895	67
Total	23,352	10,409		42,209	17,301	139

a It is of some interest to observe the size and population of the islands, the peninsula of Jutland, etc., in presenting school population, number of pupils under instruction, etc. The following figures are taken from the Statesman's Yearbook for 1897:

Division.	Area (English square miles).	Population, 1890.	Population per square mile.
City of Copenhagen (without suburbs)	7.7	312,859	40,569
Islands in the Baltic	5,024	917,401	183
Peninsula of Jutland	9,473	942,120	99
Faroe Islands (17 inhabited)	514	12,955	25
Total	15,289	2,185,335	143

Here, again, public school instruction predominates, and has about doubled in the years under discussion.

Grouped in accordance with the proportion to 100 of school population, there were either privately instructed or instructed at home:

	1867.	1893.
In rural districts of the islands	7.2	14.8
In rural districts of Jutland	6.6	9
In Kjøbstæderne of the islands	32.7	32.8
In Kjøbstæderne of Jutland	28.8	29.1

The number of public schools in the thirty-six years of 1857–1893 are as follows:

	Public schools.		
	1857.	1867.	1893.
In rural districts of the islands	1,026	1,156	1,397
In rural districts of Jutland	1,494	1,625	2,066
Total	2,520	2,781	3,463

Or a total of 23.4 per cent—for the islands, 20.8 per cent; Jutland, 25.2 per cent.

In Kjøbstæderne, for two different years, there were:

	1867.		1893.	
	Number of schools.	Classes.	Number of schools.	Classes.
In Kjøbstæderne of the islands	74	368	85	619
In Kjøbstæderne of Jutland	39	284	48	705
Total	113	652	133	1,324

In 1893, in rural districts (Landdistrikterne), the following tabulations were made:

	School population.	Taught in public schools.			Taught in private schools.	Taught at home.	Not instructed.
		In districts.	Outside of the districts.	Total.			
In the islands	104,345	87,826	2,646	90,472	10,241	3,367	265
In Jutland	128,435	114,341	2,560	116,901	6,521	4,711	302
Per cent on the islands				86.71	9.81	3.23	0.25
Per cent in Jutland				91.02	5.08	3.67	.23

If this tabulation is continued for Kjøbstæderne, these additional figures are observed for the year 1893:

	School population.	Taught in public schools.			Taught in private schools.	Taught at home.	Not instructed.
		In cities.	In towns.	Total.			
In the islands	37,645	25,583	397	25,980	10,863	725	77
In Jutland	32,861	23,081	172	23,253	9,013	520	75
Per cent in the islands				69.01	28.86	1.93	0.20
Per cent in Jutland				70.76	27.43	1.58	.23

It has heretofore been stated that the school age commences with the seventh year, but there are children in school under that age.

	Number of children taught in public schools.	Number of children under 7 years.	
		Absolute number.	To 1,000.
Towns of the islands	25,980	617	23.75
Towns of Jutland	23,253	407	17.50
Rural districts of the islands	90,472	558	6.16
Rural districts of Jutland	116,901	860	7.36
The whole country	256,606	2,442	a9.52

a Statistiske Meddelelser om Skolevæsenet i Danmark, Kjøbenhavn, 1895.

Subdivided into grades, the following statements are given:

	Principal schools.	Continuation and ambulatory schools.	Winter schools.	Preparatory schools.	Girls' schools.	Total.
Rural districts of the islands	1,204	9	.....	37	143	1,393
Rural districts of Jutland	1,732	142	28	10	119	2,029
Total	2,936	151	28	47	262	3,422

The subdivisions of higher and mixed schools are as follows:

	Communal Real schools.	Pay schools.	Mixed pay and free schools.	Free schools.	Girls' schools and preparatory schools.	Other schools.	Totals.
In Kjøbstæderne of the islands.	14	11	7	44	9	4	89
In Jutland's Kjøbstæderne....	7	8	1	32	5	2	55
Total.....	21	19	8	76	14	6	144

In proportion to the population there was in Kjøbstæderne of the islands 1 school to 2,500 inhabitants and in Jutland 1 to to 3,440 inhabitants.

The classes in higher and people's schools (Borger-og Almueskolevæsenet) in rural districts were as follows:

	Number of schools with—									Total number of classes.
	One class.	Two classes.	Three classes.	Four classes.	Five classes.	Six classes.	Seven classes.	Eight classes.	Several classes.	
In rural districts of the islands..	8	845	60	269	7	17	1	2	4	3,172
In rural districts of Jutland.....	99	1,497	116	165	6	12	2	2	1	4,243
Total	107	2,342	176	434	13	29	3	4	5	7,415

As will be observed, the greater proportion of schools have two classes; the average number of classes to each school is, for the islands, 2.60; for Jutland, 2.23. Divided into schools for boys, girls, and coeducational schools, the numbers in rural districts (Landdistrikterne)[1] were:

	Classes for boys.	Classes for girls.	Coeducational (mixed) classes.	Total number of classes.
In rural districts of the islands.....	50	45	3,077	3,172
In rural districts of Jutland.....	29	28	4,186	4,243
Total	79	73	7,263	7,415

That is, in rural districts of Jutland 98.5 per cent of the classes are coeducational and in the island districts 97.7 per cent.

This represents in the rural districts of the islands 1,193 coeducational schools and in Jutland 1,885.

The classes in Kjøbstæderne are thus enumerated:

	Classes for boys.	Classes for girls.	Mixed classes.	Total.
Kjøbstæderne of the islands.....	412	319	108	839
Kjøbstæderne of Jutland.....	310	275	171	756
Total	722	594	339	1,655

[1] Statistiske Meddelelser om Skolevæsenet i Danmark, pages 29–31.

The average number of classes for each school was, for the island, Kjøbstæder, 10.1; for Jutland Kjøbstæder, 13.7, expressed in per cent.

The number of pupils to a school is indicated in per cent. There were less than 50 pupils in 20 per cent of the rural schools of the islands and in 36.6 per cent of Jutland rural schools; from 50 to 100 pupils in 62.3 per cent of schools in the islands and 54.7 per cent in Jutland; over 100 pupils in 17.7 per cent of the island rural schools and in 8.7 per cent of the rural schools of Jutland. In the Kjøbstæder the following table gives the best presentation of the number of pupils in school:

	Pupils.													
	Less than 100.	100 to 199.	200 to 299.	300 to 399.	400 to 499.	500 to 599.	600 to 699.	700 to 799.	800 to 899.	900 to 999.	1,000 to 1,099.	1,100 to 1,199.	1,200 to 1,299.	1,300 to 1,399.
Kjøbstæderne of the islands	19	25	12	8	6	3	2	2	3	4	....	1	....	1
Kjøbstæderne of Jutland	11	5	8	11	4	4	1	5	6	3	....	....	....	....
Total	30	30	20	19	10	7	3	7	9	7	....	1	....	1

According to the law of 1856, if there are more than 100 pupils to a teacher, then a second teacher shall be employed. There are in rural districts 1,247 schools with from 60 to 100 pupils, 624 with from 70 to 100 pupils, and 221 with from 80 to 100 pupils, and these numbers are under charge of one teacher. But counting by classes, three-fourths of the classes in rural districts have less than 35 pupils to a class. In Kjøbstæderne the per cent is even less in some cities; less than 30 pupils are under instruction in one class.

PEOPLE'S HIGH SCHOOLS AND AGRICULTURAL SCHOOLS.

The above-mentioned schools are of special interest in these northern countries, as they greatly aid in developing the hard-working population far from centers of civilization. The whole higher school movement has been, in a sense, independent of the State, yet connected with it through the subsidies which aid in maintaining its schools. The work of private initiative, these schools arranged their plans according to general methods found in State schools, if such methods were found by the directors to be available. By the law of 1892 the Government assumed direction of the people's high schools and agricultural schools (Folkehøjskoler og Landbrugskoler). Each recognized school was allowed 300 crowns ($80.40) from the governmental budget, average 10 crowns ($2.68) to each pupil, until this amounted to one-third of the fund for teachers and apparatus; but no school is to receive more than 3,000 crowns ($800), nor is the whole State budget to be over 120,000 crowns ($32,160). To receive aid, the school must

have at least ten pupils, and no pupil is to be admitted under 16 years of age. The boys, however, are more satisfactory as pupils when 18 years of age. For the maintenance of backward children the "recognized" schools receive a subsidy of 20 crowns ($5.36) monthly in proportion to the half of the pupils of the last financial year. The county school boards (Amtsskoleraadne) arrange for the amounts, so that the subsidy in toto does not reach over 180,000 crowns ($48,240). The minister of public instruction has the highest general superintendence of maintenance and plans of instruction.

The first people's high school was founded in Rødding in 1844. In 1892–93 there were in Denmark 77 high and agricultural schools receiving aid from the State. Other schools had existed, but had been given up. The high schools were divided in 1892–93 as follows, according to their studies: Agricultural studies, 52 schools; natural sciences, 73; land surveying, 59; drawing, 72; arithmetic, 75; Danish, 75; history, 72; geography, 71; constitution of the country, 33; gymnastics, 58; singing, 50; religion, 27; Slöjd, 51; foreign languages, 15.

School year.	Boys.	Girls.	Total.
From November, 1853, to November, 1854	.....	.....	200
Winter of 1863 to May, 1864	.....	.....	471
Last quarter of 1867 to March 31, 1868	.....	.....	1,100
Last quarter of 1868 to March 31, 1869	.....	.....	1,500
Last quarter of 1872 to March 31, 1873	2,093	840	2,933
Last quarter of 1873 to March 31, 1874	2,132	1,003	3,135
Last quarter of 1874 to March 31, 1875	2,308	1,108	3,416
From October, 1891, to August, 1892	2,789	2,019	4,808
In summer of 1893	.....	.....	2,300
In winter of 1893–94	.....	.....	3,500

Total number of pupils in the fifty years was 110,000, namely, 75,000 boys and 35,000 girls.[1]

In 1892–93 there were connected with the 77 schools 75 directors, 170 permanent teachers, and 140 teachers by the hour, 4 directresses, 82 permanent women teachers, 58 women assistants and teachers by the hour.

Of the women teachers 2 directresses, 3 permanent teachers, and 8 by the hour (Timelærerinder) had passed the teacher's examination; 29 permanent and 13 assistant teachers had passed the high-school examination; the others were without special instruction.[2]

In the fifty years since the opening of the people's high schools and the agricultural schools between 1,600 and 1,800 men and 500 and 600 women teachers have been employed in instructing the students pursuing courses here.[3]

[1] Danmarks Folkehøjskoler og Landbrugskoler, 1884–1894, ved H. Rosendal.

[2] Statistiske Meddelelser om Skolevæsenet i Danmark: Kjøbenhavn, 1895.

[3] Danmarks Folkehøjskoler og Landbrugskoler, 1844–1894, ved H. Rosendal, pages 175, 176.

The amount of State aid to such schools is shown in the following table:

STATE AID TO PEASANT HIGH SCHOOLS.[a]

Year.	Crowns.	Dollars.	Year.	Crowns.	Dollars.
1851–1853	4,000	1,072	1855–1857	10,000	2,680
1853–1855	6,000	1,608	1857–1860	20,000	5,360

[a] The peasant high schools of 1851–1860 appear to have been developed into the people's high schools of 1860–1892, although this is not explicitly stated.

STATE SUBSIDY TO PEOPLE'S HIGH SCHOOLS.

Year.	Crowns.	Dollars.	Year.	Crowns.	Dollars.
1860–1867	22,000	5,896	1886–1890	40,000	10,720
1867–1879	28,000	7,504	1890–1892	55,000	14,740
1879–1886	55,000	14,740	1892 on	120,000	32,160

As an aid to indigent pupils the State gave as follows:

STATE AID TO INDIGENT PUPILS.

Year.	Crowns.	Dollars.	Year.	Crowns.	Dollars.
1860–1871	12,200	3,537	1879–1886	100,000	26,800
1871–1875	22,000	5,896	1886–1892	90,000	24,120
1875–1876	44,000	11,792	1892 on	180,000	48,240
1876–1879	66,000	17,688			

In order to give teachers opportunities for improvement, and also to aid them, the State gave:

STATE AID TO TEACHERS.[a]

Year.	Crowns.	Dollars.	Year.	Crowns.	Dollars.
1856–1857	5,000	1,340	1884–1889	50,000	13,400
1857–1870	9,600	2,573	1889–1890	65,000	17,420
1870–1873	15,500	4,154	1890–1892	67,000	17,956
1873–1876	24,000	6,432	1892–1893	85,000	22,800
1876–1878	30,000	8,040	1893–1894	90,000	24,120
1878–1882	40,000	11,720	1894–1895	93,000	24,656

[a] Statistiske Meddelelser om Skolevæsenet i Danmark, page 42.

A writer in the London Times, describing these two classes of schools, gives some rather interesting details, which are here quoted:

Last Saturday (September 8, 1894) in a hamlet in south Jutland, not far from the German frontier, more than twenty teachers and leaders from every part of Denmark and Norway, from Sweden and from Finland, met to celebrate a double event—the one hundred and eleventh anniversary of the birth of Bishop Grundtvig, the founder of the Danish high schools, and the fiftieth anniversary of the first of these schools.

These schools are peasants' continuation schools, which have had a remarkable success in Denmark, more particularly since the war with Germany in 1864.

These schools, amounting now to 67, besides 18 agricultural schools conducted on similar lines, have succeeded in awakening the poorest peasants, the plowmen,

the hedgers and ditchers, the cooks and dairymaids, the sailors and fishermen, from their intellectual torpor and in imparting to them a wider and more intelligent interest in men and things.

Grundtvig's pupils, young teachers and theological students, have gone through the length and breadth of the land preaching an intellectual crusade, and by the help of homely illustration and apt repartee have succeeded in awakening the keenest desire for knowledge for its own sake.

Out of a working population of about a million and a half 6,000 young men and women, most of them between the ages of 18 and 25, flock every year to these schools and there live a common life under the same roof—the men for the five or six winter months and the women for the three summer months.

To enable them to do this the expenses are reduced to a minimum—about $75 for six months' instruction, board, and lodging, including all extras; and the poorer half of the students, on the recommendation of a clergyman or other authority, receive State bursaries that defray half the cost. * * *

Scientific education is professional and can never become the possession of the multitude. Children, perhaps also grown-up people, can be trained to pick up the crumbs that fall from the table of science, but intelligence derived in that way will only be fractional, will only become a demicivilization, a "boyish science," as Grundtvig liked to call it, and has just as little to do with real science as with real education. It is well to dilate on the means whereby all this interest is maintained from year to year. Science is of course taught, but that is not the mainstay. What is most relied upon is the lively teaching by the voice rather than by textbooks, of the "humanities" of history, language, and literature, particularly those of the native country, though not to the exclusion of the history and literature of other countries, both in ancient and modern times. * * * The Danish peasant, after a winter or two at the high school, may, as soon as his resources allow him, have a winter at the agricultural or technical schools. The 67 high schools and the 18 agricultural schools are closely related to one another, being united in one common association. * * * Not only the most but the best of the pupils in the agricultural schools have first been pupils of the high schools; that between 1870 and 1880, when Danish agriculture was on the brink of ruin and it became necessary to turn from corn growing to dairy work, and again in 1880, when cooperative dairies dealing with the milk of a score or two of farms were required in order to produce the finer qualities of butter for the English market, it was the bright ready intelligence of the old high-school pupils that enabled the requisite changes to be made with rapidity and success.

We in England recognize for our middle classes the necessity of grafting technical training on the humanities, if the graft is not to wither and die. Grundtvig's merit as an educationist was his seeing so clearly that, mutatis mutandis, precisely the same method was alike necessary and feasible for the humblest peasant or artisan. And so, as he had also the courage of his convictions, he had the happiness before his death, in 1872, of seeing his vision already a reality.

Very many thousands of young men and women have by this time passed through these schools of citizenship and patriotism, and it is easier to imagine than to estimate exactly their influence on the prosperity of agriculture and trade, on the removal of social barriers, and on the growth of constitutional and religious freedom.

SECONDARY SCHOOLS.

Convent and cathedral schools, dating from the introduction of Christianity in 965, were the predecessors of the famous Latin schools established in Viborg, Ribe, Odense, and Copenhagen for clericals and laymen of the higher classes. The establishment of two grades

of Latin schools under clerical supervision dates from the Reformation period. They admitted students from both urban and rural districts to their three or four classes. A third class of schools—the scholæ vulgare (Skriveskoler) or writing schools—omitted Latin, and were under the supervision of municipal authorities. At the commencement of the sixteenth century city schools predominated; the country population had almost no instruction except in the catechism from the sacristan or degn of the parish, who gathered together the neighboring children of a rural domain or "Gaard."

As early as 1537 the number of classical schools (lærde Skoler) was 39 (in Seeland, 15; in Jutland, 24).[1] During the centuries which followed this class of schools decreased and institutions developed which were more practical in instruction, or perhaps their funds were transferred to lower grade schools, wherein the Danish language, instead of Latin, became the medium of communication. In the middle of this century the classical schools were as follows:[2] The Metropolitanskoler in Kjöbenhavn, seven Katedralskoler in Roskilde, Odense, Nykjöbing near Falster, Aarhus, Aalborg, Viborg, and Ribe, and the schools of Randers, Horsens, and Hilleröd (Frederiksborg lærde Skole) and the Sorø academic secondary school[3] (Sorø Akademisk lærde Skole). The "lærde Skoler" were, as late as 1805, under the same general supervision as that of the university, but in 1848 the minister of ecclesiastical affairs and public instruction had charge. At the present time the laws governing these schools are those of 1871, with additions and modifications in 1882 and in 1893. The "lærde Skoler" now have six classes, and the students enter at the close of the twelfth year, remaining to the close of the eighteenth year of their age.[1]

The average number of students in these classical schools is as follows in various years:

RECEIVING CLASSICAL INSTRUCTION.

Year.	Students.	Year.	Students.	Year.	Stu. dents.	Year.	Students.
1821–1845	848	1870–1875	1,372	1883	1,837	1887	1,931
1843–1847	859	1880	1,514	1884	1,907	1888	1,892
1849–1860	1,374	1881	1,613	1885	1,970	1889	1,906
1863–1870	1,632	1882	1,719	1886	1,972	1890	1,871

The decrease in pupils between 1863–1870 and 1870–1875 was due to the outcome of the war of 1864.

[1] Statistiske Meddelelser om Skolevæsenet i Danmark.

[2] Retsregler for det höjere Skolevæsen i Danmark.

[3] The Sorø Academy was founded in 1580; changed to Knights Academy in 1749; a strictly classical school since 1849.

From that period the tendency was more toward practical instruction.[1] The private "Latin skoler" (the one at Herlufsholm dates from 1605) numbered 5 in the middle of this century; in 1882 there were 18, of the number 11 in Copenhagen and 1 in Frederiksborg. Among these are included communal schools of Fredericia Kolding, Vejle, and Helsingør, the pay schools of Herlufsholm and Birkerød, and latterly a pay school at Ordrup. The number of pupils of the private Latin schools reported for the years of 1849–1863 was 1,007; in later years the higher classes for the so-called students and real students (Studerende og Realistor) had the following quota:

NUMBER IN SIX UPPER CLASSES.

Year.	Pupils.	Year.	Pupils.	Year.	Pupils.
1882	1,929	1885	2,250	1888	2,110
1883	1,990	1886	2,228	1889	2,135
1884	2,075	1887	2,074	1890	2,229

The secondary schools, as stated above, include classical and real divisions. The former are divided into the philologico-historical section, and the mathematico-natural science section. Between the secondary and the elementary grades are burgher schools, with courses in Danish, French, German, and English languages, history, geography, arithmetic, geometry, natural history, penmanship, and drawing. These burgher schools are similar in character to the German Real schools, but not of as high grade as the Danish Real school.

In the "laerde" and Real schools the course of study is similar for the lower classes. The Real school does not require Greek; but three modern languages are obligatory. The classical (laerde) school has French obligatory for six years, German through four years, and that or English in the two upper classes. The following statistics indicate the trend of study for various years, whether toward the university or toward practical life:

IN THE STATE SCHOOLS.

Year.	Students.		Real students.	First and second classes.	Total.
	Philologico-historical.	Mathematico-natural science.			
1882	611	113	429	566	1,719
1883	646	126	463	602	1,837
1884	657	142	504	604	1,907
1885	678	162	546	584	1,970
1886	696	154	552	570	1,972
1887	709	167	536	519	1,931
1888	686	167	523	516	1,892
1889	643	194	543	523	1,903
1890	605	203	550	513	1,871

[1] Statistiske Meddelelser om Skolevaesenet i Danmark.

In other classical schools the proportion was as follows:

Year.	Students.		Real students.	First and second classes.	Total.
	Philologico-historical.	Mathematico-natural science.			
1882	539	89	737	564	1,929
1883	564	116	739	571	1,990
1884	580	158	748	590	2,076
1885	652	162	839	597	2,250
1886	621	180	859	568	2,228
1887	529	184	816	545	2,074
1888	518	205	840	547	2,110
1889	525	227	830	553	2,135
1890	563	256	883	527	2,229

A gradual progression is noticeable in the number of students of the mathematico-natural science section, although the numbers do not reach those of the philologico-historical section. The so-called "Realister"[1] outnumber all other students in the universities, indicating, doubtless, that there, as elsewhere, the tendency of study is toward practical life. In the years 1875–1892 (inclusive), 5,727 students were prepared for the university. In the period 1875–1888 there was an average of 261 annually, or 159 in 1875 to 406 in 1888. Of the total, 4,538 took the historico-philological examination, 1,189 the mathematico-natural science examination.

Since 1875, women have been permitted to enter the university, and from 1875 to 1892 (inclusive) 85 women entered. The percentages of students in these secondary schools, reckoned according to age, were as follows:

Year.	Class of schools.	16 years.	17 years.	18 years.	19 years.	20 years.	21 years.	22 years and over.
1893	State schools	.....	4.8	38.7	40.4	10.7	3.6	1.8
	Private schools	0.9	6.9	31.5	23.7	14.8	6.5	15.7
1885	State schools	.6	14.3	34.3	30.2	14.3	4.6	1.7
	Private schools	.....	15.7	33.3	22.9	10.5	5.2	12.4

The greater proportion of second classical students were from official and agricultural classes, although the children of business men gravitated in large numbers into the private classical schools.

The number of hours each week in the different classes is presented in tabular form below. Gymnastics and singing are omitted. The maximum is given in parentheses, the general average stands just above:

Years.	Class VI.	Class V.	Class IV.	Class III.	Class II.	Class I.
1855–1856	32.85 (30.35)	32.62 (28.35)	33.09 (32.34)	33.85 (32.34)	33.85 (32.34)	33.85 (32.34)
1877–1878	29.83 (29.30)	30	30	30	30	30
1893–1894	30.15 (30.32)	30.15 (30.32)	30	30	30	30

[1] It may be said here that there are 98 schools which prepare for the Real examinations, and 69 of them are exclusively Real schools or secondary schools leading to practical life.

According to the new plan of study established in 1871, the following table gives the time regulated as above in the different studies:

Studies.	1855–1856.

In these schools the year of study begins on August 19 and its length is 250 days; that is, there are 250 lecture days (Laesedage). The number of teachers in the royal classical schools, Sorø Academy excepted, was 144 in 1893 to 101 in 1848. Viewed according to the professions for which the teachers were preparing, it is observed that persons seeking philological and philosophical degrees increased from 1848 to 1893, while there was a distinct decrease in persons seeking theological preparation.

A new order pertaining to the pay of teachers of these classical schools was promulgated in 1892. The rectors were to receive, with free lodging, 4,200 crowns ($1,125), with an increase of 400 crowns ($107) in five years until 5,000 crowns ($1,340) is reached. Salary of the head teachers was 3,000 crowns ($804), increasing 400 crowns ($107) every five years until 4,200 crowns ($1,125) is reached.

Assistant teachers receive 1,800 crowns ($482), with increase of 200 crowns ($53) every three years until 2,400 crowns ($643) has been reached; thereafter 300 crowns ($80) extra every three years until 3,000 crowns ($804) is reached. The principal teachers must not exceed the assistant teachers by more than one-third. Similar regulations govern Sorø Academy.

The King appoints the rector, the principal teachers, and adjuncts, who receive pensions in accordance with the regulations governing teachers generally. The minister of public instruction appoints the teachers by the hour (Timelaerere), and no one of these can become an assistant teacher until after two years' trial; then the "Timelaerere" may receive an appointment from the King or he may be retired. Over 56 per cent of these "Timelaerere" receive 1 crown (26.8 cents) or more an hour; 20 per cent receive from 0.80 to 0.90 öre; others 40.2

[1] The Real schools proper are treated further on. These classes train the students more practically than the classical divisions.

cents. In the private "laerde" schools of Copenhagen the time and salary of the "Timelaerere" are thus presented:

Salary (in crowns) per hour.	United States currency.	Number of teachers.	Per cent of teachers.	Number of hours.	Per cent of hours.
4.00 to 5.00	$1.07 to $1.34	2	0.89	12	0.38
3.00 to 4.00	.80 to 1.34				
2.00 to 3.00	.53 to .80	6	2.68	82	2.25
1.50 to 2.00	.40 to .80	19	8.48	298	8.19
1.00 to 1.50	.26 to .40	89	39.73	1,625	44.66
.90 to 1.00	.24 to .26	21	9.37	372	10.25
.80 to .90	.22 to .24	24	10.72	365	10.04
.70 to .80	.18 to .22	20	8.93	284	7.80
.60 to .70	.16 to .18	25	11.16	265	7.29
.50 to .60	.14 to .16	10	4.46	187	5.14
Under .50	Under .14	8	3.58	147	4.05

As for the economic side, the school fees in the State classical schools were, as a rule, from 120 to 144 crowns ($32 to $38), with rebate if there were two or three brothers attending during the four years. In the coeducational classes of the Copenhagen Latin schools the boys pay from 6 to 12 crowns ($1.60 to $3.20); in the six higher classes from 14 to 18 crowns ($3.75 to $4.82). The registration fees are 4 crowns ($1.07); fuel, 4 crowns; slöjd, 1 to 2 crowns a year, in United States currency, 26.8 to 53.6 cents. The income and expenditures in the different years for the classical schools and for Sorø Academy is presented below. There are many free places in these schools.

Schools.	Years.	Income.	Expenditure.	Increase (+) or decrease (—).
		Crowns.	*Crowns.*	
Sorø Academy	1876–1881	592,743	526,776	— 65,967
Classical schools		563,117	519,958	— 43,159
Sorø Academy	1881–1886	575,711	566,178	— 9,533
Classical schools		579,791	586,384	+ 6,593
Sorø Academy	1886–1891	505,469	489,072	— 16,397
Classical schools		524,060	*a* 734,337	+210,277

a The noticeable increase here is on account of new schools, funds for honorarium, and prizes. The crown is valued at 26.8 cents.

Real schools.—There have been classical schools, with object of preparing for university study, under the care of the State for years; but it is only within a recent period that Real schools have been instituted. In the older laws at the beginning of the century the Real or practical side of training was associated with the elementary grades, the first beginnings being in the forties at Aarhus, Sorø, and Rønne. Royal resolutions of 1855 placed the Real school on a similar basis to that of State classical schools for a common examination. In 1838[1] there was a preparatory examination at the university for those who intended to take special courses. In 1859 it was found necessary to have an

[1] Statistiske Meddelelser om Sholevaesenet i Danmark, Kjøbenhavn, 1895.

examination—of a lower grade—as a maturity examination for the real schools, that is, in such schools as did not seem to come under the plan of 1855. Finally, in 1857, a preparatory examination of a higher grade in the university was decided upon as an outcome of the graduation examinations for the Real schools ("Real Afgangseksamen") of 1855. Again, in 1881, all these examinations were done away with and a common preparatory examination (almindelig Forberedelseseksamen) was held before a commission appointed for such purpose, or in the schools. The differences in the examinations were shown somewhat by the fact that some students took two or three foreign languages, while others did not. English is obligatory in both cases. A decree of 1882 gave women the right to take this examination.

In 1891 a burgher school examination was instituted, in part equivalent to the former lower grade examination of the Real schools. It permitted children of confirmation age to enter the practical training schools. This gave no public rights, but only indicated an extension of the communal school studies. Since 1886 the State has assumed control over this practical side of education. The Real school[1] subsidies are given to the communal and private Real schools and to that subdivision of the classical school. The examinations are controlled by the State and there is a Real school inspector (Undervisningsinspektor for Realskolerne).

The following table indicates the status of Real school instruction to June 1, 1894. It is headed "Meddelelser om Realundervisningen," but seems to include all schools where practical training is given in accordance with Real school methods:

Schools.	Number.	Students.	Boys.	Girls.	From other places.	Parents' position.				
						Officials and business men.	Merchants and tradesmen.	Mechanics (Handverkere).	Artists.	Private scientific men, etc.
Boys' schools in Copenhagen	16	3,564	3,564	.....	97	572	1,249	603	64	32
Classical schools	12	574	574	.....	206	106	173	86	.....	3
Communal Real schools outside of Copenhagen	29	3,530	3,160	370	395	536	918	877	2	21
Private Real schools outside of Copenhagen	44	4,209	3,419	790	1,170	719	1,213	590	14	35
Girls' schools in and outside of Copenhagen	23	2,970	.....	2,970	252	550	1,069	257	30	25
Total	124	14,847	10,717	4,130	2,120	2,483	4,622	2,413	110	116

[1] Instruction for practical duties is given in these groups of schools: communal, private, in the Real subdivision of the classical schools, as well as in legally constituted Real schools.

Schools.	Parents' position.										
	Managers.	Private teachers.	Physicians.	Lawyers.	Agriculturists.	Seamen.	Day laborers.	Other trades.	Private individuals and pensioners.	Widows.	Orphans.
Boys' schools in Copenhagen	243	53	51	44	61	125	26	100	70	257	14
Classical schools	14	9	10	8	86	3	2	4	9	57	4
Communal Real schools outside of Copenhagen	95	11	59	51	247	191	123	81	27	202	29
Private Real schools outside of Copenhagen	225	64	80	42	572	121	70	106	50	266	42
Girls' schools in and outside of Copenhagen	200	30	100	99	95	36	8	101	58	279	33
Total	777	167	300	244	1,061	476	229	392	214	1,121	122

Of the total number of students (14,847) there were 6,454 in the Real classes proper, the remainder (8,393) in lower classes. Of the 6,454, the boys numbered 4,838, girls 1,616; that is, 25 per cent were girls; or of the total number of students 28 per cent were girls. As for the personnel of the teachers, the subdivision was as follows in twelve communal schools and 42 private Real schools in 1894:

Schools.	Permanent teachers.	By the hour. (Timelaerere.)	Of the permanent teachers.			
			Candidates in theology, philology, philosophy, polytechnic teachers, pharmacists.	From normal schools.	Other places.	Women teachers.
Communal	90	42	50	37	4	9
Private	237	94	67	95	13	62

The subsidies received from different sources in the year 1893–94 were as follows:

Schools.	State.	County.	Communal.	Other sources.
	Crowns.	*Crowns.*	*Crowns.*	*Crowns.*
Communal	46,000	7,300	32,000	17,000
Private	58,000	11,500	15,500	4,600
Total	104,000	18,800	47,500	21,600

The total amount was 191,900 crowns ($51,429). For the financial year 1894–95 some 33,900 crowns ($9,085) of the Sorø Academy fund were distributed to 19 communal schools, 68,600 crowns ($18,304) to 49 private schools, 6,800 crowns ($1,830) to 10 private schools for girls, or a total of 109,300 crowns ($29,294), while from the classical school fund a subsidy of about 30,000 crowns ($8,040) was given to

private schools and Real schools. The following number of persons passed the preparatory examination in 1883–1894:

Persons who have passed the "Almindelig Forberedelseseksamen" in 1883–1894.

Year.	In the schools.	Before the commission.	Total.	Year.	In the schools.	Before the commission.	Total.
1883	354	41	395	1889	735	326	1,061
1884	428	108	536	1890	760	352	1,112
1885	562	129	691	1891	815	308	1,123
1886	735	136	871	1892	877	280	1,157
1887	819	181	1,000	1893	876	243	1,119
1888	689	339	1,028	1894	900	274	1,174

As will be observed, the number of those passing the examination trebled in ten years.

Schools.	Number of schools on Apr. 1.	Number of pupils on Apr. 1.	Within the town on Aug. 15.	Without the town on August 15.	Position of parents. Officials and functionaries.	Merchants and tradespeople.	Mechanics.	Agriculturists.	Seamen.	Other positions.
Outside of Copenhagen.

To more thoroughly understand the course of study in the Real and classical schools, it is here stated that in the four lower classes the courses are identical, with this exception: The Real schools have no Greek and the "laerde skoler" no geometrical drawing or science in these classes. Attendance is from the twelfth to the eighteenth year. In the classical schools French is obligatory for all six years; German through the fourth class, although the student may continue it or take English instead in the upper classes. The Real schools have three modern languages obligatory. At the closing examination a written French exercise is required, and the pupils give oral demonstration of the German or English language. The Real-school students who wish to go to the polytechnic or the academy of forestry pass an examination in three languages; other students in English, with either German or French.

THE UNIVERSITY AND SPECIAL SCHOOLS.

The university in Copenhagen (with its courses of study in law and political science, theology, medicine, philosophy, literature and philology, and mathematical sciences) was so fully described on pages 534–536 of the Report of the Commissioner of Education for 1889–90 that only slight mention will be made of it here.

Founded in 1479, it has 40 professors and about 1,300 students; women have been admitted to its faculties (except theology) since 1875, when a royal decree accorded them "le droit de cité académique."[1]

A college of pharmacy was founded in 1892; 7 teachers are engaged in instructing the pupils. In the same year a veterinary and agricultural college was founded in Copenhagen, which has 22 teachers. Twenty-one agricultural and horticultural schools have a course of study leading to the college course. A royal academy of fine arts dates from 1754; connected with it are 7 teachers.

Institutions for the blind, deaf-mutes, and idiots are fully described on pages 542–546 of the above report. These institutions are national or subsidized and are under control of the ministry of public instruction.

THE TEACHER: PREPARATION FOR POSITION; ASSOCIATIONS.

The new Danish normal school law of March 30, 1894,[2] seems to permit the training of both men and women for the position of teacher in the State normal schools, situated in Fionia, Jutland, and Seeland. Private normal schools are also reported for both sexes; and in the last decade these were the only schools to which women were admitted when desiring to fit themselves for a teacher's position.

The State schools have, as formerly, a three years' course, to be admitted to which the individual must be fully 18 years of age.

[1] La femme au point de vue du droit public, par M. Ostrogorski.

[2] Vor Ungdom, 1894. Hæfte 2-3.

Practice schools are connected with the normal departments, and there are examinations from class to class. The final examination, after the three years' course, is held by a board of examiners, who determine what written proofs of knowledge shall be given, with the minister of ecclesiastical affairs and public instruction as chairman. The diploma indicates whether the normal student has prepared himself (or herself) for general teaching or for special branches. Pupils of "recognized" private normal schools pass similar examinations to those of the State schools. The minister has also general oversight. Admission to the State normal schools is granted after an examination is passed. The written theses for such examination include dictation, Danish composition, methods of recitation, the explanation of a proverb, moral teaching, writing, arithmetical computations, etc. The oral examination covers questions about grammar, grammatical analysis, arithmetical questions, Danish history, universal geography, religion, and sacred history. Normal school instruction is not gratuitous. Formerly the charges varied at different schools. Now 40 crowns ($10.72) is the fee, but there are free places, and children of teachers have free admission. The State and recognized private normal schools (anerkendte Privatseminarier) receive annual subsidies for aid to teachers, school material, etc. The amounts vary according to the designated purpose, from 1,200 to 5,000 crowns ($321 to $1,340).

A law of March 30, 1892, also established a State school for the training of women teachers to fill positions in preparatory schools (Forskolen), where the children are from 7 to 10 years of age, and the classes include 25 pupils. Instruction from one to one and a half years is considered sufficient for such teachers.

As an additional preparation for the teacher's position, there are opportunities for travel, with consequent broadening of the mind, conferences and associations for the discussion of pertinent educational topics. For instance, "Danmarks Lærerforening" is working for the increase of teachers' salaries, which are considered inadequate in rural districts; and even in Copenhagen the amount contributed by the State is not considered to be ample enough to repay the teachers for their educational efforts. In Copenhagen the discussions among the teachers and before the board of education cover the need of more remuneration for young teachers and for women teachers who act as substitutes, or who give hours of instruction each week beyond a certain limit.

The Danish ministry for ecclesiastical affairs and public instruction has decided that in case changes are to be made by the school committee of rural districts, that teachers be allowed a voice in the matter. Every teacher may not act as a member of the committee, but one may be duly appointed whose duty it will be to present the needs and requirements of the district, if there be changes of teachers, new

school buildings erected, etc. The Danish teachers' association desires to have one of the district teachers as a member of the committee, and to have all teachers of the district meet with the committee annually.

The ministry has also decided upon an annual subsidy at the expense of the commune for the purpose of purchasing books for teachers who may be in need of more advanced culture. The exact amount of subsidy is yet to be decided, and it rests with the school board to see that the plan is carried out. The teachers are to have a voice in the matter, however, and to signify what seems to them most needed.[1]

For the discussion of topics of general interest to all or many of their fraternity the teachers of Scandinavia gather together, in general assembly, every five years in one of these three northern countries. The first meeting was held in 1870 in Göteborg, and 630 teachers from Sweden, 250 from Norway, and 120 Danes took part. The sixth meeting was held in Copenhagen in 1890, with an attendance of 3,000 Danes, 1,100 Norwegians, 1,000 Swedes, and 160 Finns.[1]

In 1895 the teachers met in Stockholm for discussion of subjects interesting to those engaged in educational work in all three countries. The oldest association of teachers, "Paedagogiske Selskab" of Denmark, held its seventy-fifth anniversary in 1895. Many noted educators were present, among them the minister of public instruction.[2] This association dates from 1820, and its members at different periods have earnestly discussed scientific, pedagogical, and practical questions. At first there were 65 members. By degrees the association decreased in numbers and at last became simply a gathering for social enjoyment. In 1840 a new era was entered upon, and the discussions became quite practical in character. Again, toward the sixties, there came a period of retrogression. In 1890 women teachers were admitted to membership. This association is now recognized as a power in matters pertaining to the school system of Denmark. A library of 2,000 pedagogical works and a fund of 60,000 crowns ($16,080) for the aid of teachers in Copenhagen are due to its initiative. There are now 700 members.

On October 13–15, 1895, the Association of Higher School Teachers of Denmark met in Copenhagen. They discussed the need of more time for the study of English and less for Greek in the secondary schools; also the need of teaching the mother tongue, so that through the understanding of the history and literature a nearer bond of union between the three countries—Norway, Denmark, and Sweden—would result.

---

[1] Deutsche Zeitschrift für Ausländisches Unterrichtswesen, 1er Jahrgang, Heft I, pages 70–72.

[2] Deutsche Zeitschrift für Ausländisches Unterrichtswesen, 1er Jahrgang, Heft II, Page 181.

The Association of Teachers of Girls' Schools met for the third time in October, 1895, and discussed the need of higher education for women teachers, the object being to prepare them to teach in higher-grade schools. The pensioning of private-school teachers was also considered desirable.

HISTORICAL DATA.

965. Establishment of convent and cathedral schools, from which developed Latin schools (in Viborg, Odense, Ribe, and Copenhagen) for the clergy and laymen of the upper classes. In Iceland, which became subject to Denmark in 1380, the first school can be traced to 981.

1478–79. Founding of University at Copenhagen.

1537 on. Latin schools (instructing in Latin, Greek, religion, singing, and writing) improved and increased in number, giving one to each city; educational facilities lacking in rural districts, except as the clergyman of the parish gathered the children together and taught the catechism. Sorö Academy established in 1580; changed to a Knights' Academy in 1749. It is a strictly classical school since 1849.

1699–1730. Organization by King Frederic IV. of people's schools,[1] a royal decree of 1721 regulating such organization and requiring the attendance of children between 5 and 8 years of age.

1739. (January 23) Elementary instruction rendered obligatory through a decree promulgated by Christian VI (1730–1746); common schools, with instruction in the Danish language, to be established in all large villages; reading, writing, arithmetic, and religion to be taught, and the schools to be supported by a revenue fund, school taxes, fines, and contributions.

1784–1839. Educational reforms inaugurated by the Regent (afterwards) King Frederic VI, who succeeded in establishing a well-organized school system; in 1790–91 the first normal school established at Nörrebro (suburb of Copenhagen), thence transferred to Jönstrup in 1809; on July 29, 1814, decrees[2] promulgated which regulated elementary instruction in urban (Copenhagen excepted) and rural districts, and five normal schools were created.

1828–1840. Gymnastics introduced in 1828 in all schools; in 1835 the first asylum for children established in Copenhagen, and three others created between 1835 and 1842; higher-grade schools were created in 1838, and from 1840 date the present people's high schools (Folkehøiskoler).

1844–1855. Latin schools were transformed into gymnasia and Real schools in 1850; decrees of 1850, 1864, and 1869 regulated examination for admission to the University of Copenhagen; in 1844 and 1857 promulgation of decrees tending toward general improvement in the schools of Copenhagen; in 1855, 1856, and 1864 there were decrees pertaining to urban (Copenhagen excepted) and rural schools.

---

[1] At that period the nobility had their tenantry taught on their estates by the clergy or by some one designated for that purpose.

[2] These decrees, the principal features being still in force, established two-class elementary schools in rural districts (in localities rich enough to maintain them) and two schools in each of the larger villages. If feasible, burgher schools, higher-grade schools, and evening schools for adults were to be established, and obligatory attendance in elementary grades was recognized as a feature of the school system.

1856-1867. A law of March 8, 1856,[1] required the construction of class rooms so as to give 90 cubic feet of space and 2 meters 48 centimeters in height for each child. By decree of January 27, 1860, the minimum of school attendance was to be 240 days of 6 hours each. In 1865 institutions were established in Copenhagen for the education of idiots. By law of 1867 a commission (composed of 11 members) was appointed by the Government to examine candidates for the position of teacher.

1874. Iceland, the chief dependency of the Crown, has its own constitution and administration by a charter of January 5, 1874, which went into operation August 1, 1874, and by the terms of which the legislative power is vested in the "Althing." A minister for Iceland, appointed by the King, is at the head of the administration. The highest local authority is vested in a governor-general. Two Amtmænderne, or under-governors, superintend affairs in the northern and western districts.

1875. Women accorded academic rights, with the privilege of obtaining all university degrees, except theology.

1881. Introduction of the "Forberedelseseksamen," or preliminary examination, for both public and private schools of secondary grade. This examination admits to veterinary and agricultural colleges, schools of pharmacy, dentistry, and law, and to appointments (for men) in the post and telegraph service, etc.

1883. A decree required examination in three languages of all Real school students desiring to enter the polytechnic school or the academy of forestry. From 1883 dates the "Studenter Samfundets Aftenundervisning för Arbejdere," an association for the purpose of aiding the working classes to obtain an advanced educational training.

1886. The "Dansk Slöjdforening" first report on manual training schools according to the Aksel Mikkelsen system; object of the association to have manual training as a means of both hygienic and pedagogical development introduced into all grades of schools.

1887. Opening of Danish School Museum in Gladsaks, near Copenhagen; removed to that city in same year; its object to gather modern school material, books, maps, apparatus, etc., from Denmark and other countries; to present historical phases of education; to acquaint teachers and students with pedagogical literature; to make exhibits of school material, etc. The library possessed more than 2,000 volumes in 1894.[2]

---

[1] An improvement was noticed very soon after the promulgation of this law. Subsequently to that date we find the following conditions in 100 schoolrooms:

	On the islands.		In Jutland.	
	1857.	1867.	1857.	1867.
Less than 50 cubic feet	7.3	1.41	13.2	7.59
From 50 to 89 cubic feet	60.6	54.08	56.6	59.63
From 90 feet on	31.7	43.65	27.1	31.41
Not reported	.4	.86	3.1	1.28

The three most northern counties (Hörring, Thisted, and Aalborg) of Jutland were the worst off in this respect, for in 1867 (to the 100 school children) less than 50 cubic feet were accorded to 16.1, 14.2, and 7.7 in the respective counties. From 50 to 89 cubic feet were allotted, respectively, to 66.7, 60.5, and 66.9 of the hundred.

[2] Oesterreichischer Schulbote, Dezember 1894.

1890. Resolutions adopted by the Danish Slöjd (manual training) Association in November for the introduction of slöjd in rural schools. A "Dansk Slöjd Lærerskole," for the preparation of teachers of this branch of study, instituted by the Government.

1892. Law gives State control of agricultural and people's high schools (Folke- og Landbrugs Højskolerne); decree of March, 1892, established a school with one to one and one-half years' course for the purpose of training women teachers to take charge of preparatory training of children 7 to 10 years of age.

1894. New normal school law for men and women teachers, age of admission 18 years; course three years with practical instruction in model school; graduation diploma after examination before the board (Censorerne), and minister of ecclesiastical affairs and public instruction.

CHAPTER IV.

EDUCATION IN NORWAY.[1]

TOPICAL OUTLINE.—Population and administration.—Former presentations.—Historical data.—General features of the school system.—Statistics of 1892 compared with 1889.—Expenditures for 1889 and 1892.—Results of law of 1889 statistically considered.—Courses and methods of study.—Pedagogical congress: Discussions in 1894–95.—Physical training.—Coeducation and the transition period.

RÉSUMÉ OF EXISTING CONDITIONS.[2]

A constitutional monarchy vested in the Storthing as legislative power and in the King as executive power, with a council of state as aids. Area, 124,445 English square miles; population, 2,000,917 on January 1, 1891; capital, Christiania; population, 151,239 on January 1, 1891. Total number of youth in schools, 319,373 in 1892, or 15 per cent of the population; in elementary schools, 306,658, or 96 per cent of those in all grades; average of children to a teacher, 61; expenditures, $921,659, or $3.91 per capita for each child. Minister of ecclesiastical affairs and public instruction, J. L. R. Sverdrup; general secretary, M. R. Norby; chief officer in charge of educational affairs, J. C. Johanssen; keeper of the royal archives, H. J. Huitfeld-Kaas.[3]

For local government, Norway is divided into 20 districts, namely: The towns of Christiania and Bergen and 18 counties (Amter), each governed by an "Amtmand" or chief executive functionary. The "Amter" are subdivided into 39 towns and

[1] Prepared by Miss Frances Graham French, specialist in the school systems of northern and eastern Europe.

[2] The Norwegian educational system in extenso was presented in the Report of the Commissioner of Education for 1889–90, pages 475–517.

[3] Statesman's Year-Book, 1896; Almanac de Gotha, 1897.

56 "Fogderier," the latter comprising 22 ports (Ladesteder) and 494 rural communes (Herreder), which are mostly parishes or wards. The "Herred" is governed by a council and a body of representatives three times as large as the council. The councilors (Formændene)—3 to 9 in number—are elected from the different wards of the commune. These bodies elect conjointly, every year, a chairman and deputy chairman from among their number. The chairman, the "Amtmand," and the "Fogderier" or sheriffs form the county diet (Amtsformandskab), which holds an annual meeting to arrange for the county budget. The towns and ports form 58 communes, governed by a council (4 to 12 members in Christiania) and by representatives, who outnumber the councilors threefold. The members of both local governing bodies are elected for the Storthing by voters in towns and rural communes. The chief functionary of each county and the bishop of each diocese are members of a county board which looks after educational interests. The municipal council votes on the school budget, and some members belong to the district school board; a member of each local school committee is a clergyman.

HISTORICAL DATA.[1]

1397. Treaty of Calmar, which reunited Norway to Denmark and Sweden.
1527. A definite severing of that union, Norway being left dependent upon Denmark.
1536. Reformation gave first impetus to education, although not creating a systematic public-school system.
1736. Royal decree providing that no children be admitted to confirmation who had not been instructed in the elements of Christianity.
1739. Promulgation of school law, based on this provision.
1741. Modifications requiring the establishment of a school in each district.
1811. Founding of University of Christiania, although not organized until 1824.
1814. (January 14). By treaty of Kiel the King of Denmark ceded Norway to the King of Sweden, but the Norwegian people did not recognize this act and sought for independence.

[1] Larousse: Dictionnaire Universel, v. 11; Udkast til en forandret Ordning af det höiere Skolevæsen: Beretning om Skolevæsenets tilstand; Det kongelige Norske Frederiks Universitets Aarsberetningen; Lois du 20 juin sur l'École Primaire.

1814. Establishment of constitution of Norway, the Storthing first interesting itself in the furthering of educational progress.

1815. Promulgation of a charter (Rikssak) establishing new fundamental laws, the union of the two kingdoms to be indissoluble and irrevocable, without prejudice to the separate government, constitution, and code of laws of either Sweden or Norway.

1821. The title of noble abolished in this most democratic division of Scandinavia.

1824. Organization of the university faculties.

1825. National institute for the education of the deaf and dumb created in Trondhjem; the sign method is used. In 1848 the articulation method is used at Schafftellökken.

1827. Promulgation of school law dividing elementary schools into rural and urban schools, each having its own legislation. It also provides for the establishment of normal schools in the different dioceses.

1848. Law in regard to city schools, regulating the supervision, expenditure, number of schools, obligatory instruction, courses of study, teachers' salaries, etc.

1860. Law in regard to country schools, regulating administration, expenditures, length of school vacations, school age, and also establishing practice schools for teachers in connection with the higher elementary grades. At this date we first read of measures for the education of the blind.

1869 (May 22). Additions to law of 1860, permitting the employment of women teachers in lower grade elementary schools.

1869 (June 17). Law regulating secondary education, the courses of study arranged so as to determine the precise status of the middle schools and gymnasia.

1869 (July 31). Decree fixing course of study for the six normal schools of the different dioceses.

1869 (November 6.) Highest administration of higher public schools conceded to department of ecclesiastical affairs and education.

1870. Regulations for course of study in middle schools issued by department of ecclesiastical affairs.

1873. Law for public elementary schools in rural districts, supplementary to laws of 1860 and 1869, respecting subsidies to school or locality from State or local sources.

1878. Law for public elementary schools in rural districts, supplementary to laws of 1860, 1869, 1873. Includes possible additions to salaries of teachers and assistant teachers from governmental funds. Admits women to graduation examinations from the middle schools.

1881. Law appertaining to elementary schools, supplementary to earlier laws. Creates sufficient number of schools for the instruction of the defective classes.

1884. Law permitting women to enter for the *examen artium* and *examen philosophicum*.

1885 (March 1). Courses of study in secondary schools changed from plan of 1870.

1885 (December 22). The department of ecclesiastical affairs given the power to admit girls as pupils in the public schools providing such admission does not interfere with the instruction or discipline.

1883, 1885, 1886. Decrees concerning admission to the *examen artium* of gymnasia and Realschools, prerequisites of study, place and time of examination, etc.

1889. Law reorganizing elementary education in both urban and rural districts, the appointment of teachers being left to local boards, as also the plan of instruction.

1889 (June 26). Women eligible on school committees in towns and, if they are mothers, may vote for election of school inspectors. In rural communes, if tax payers, they may vote in the district assemblies, which decide upon school affairs, amount of school funds, inspectors, etc. They are also eligible as inspectors.

1890. Commission for reform of secondary schools appointed; the aim to bring about greater concentration of instruction, to stem the tide of overpressure, and to adopt the best reform movements in education. Special investigation is to be made regarding the amount of ancient language study as compared with the need of the modern languages.

1890 (January 18). Law for the protection of children, girls, and women employed in manufactories; children of school age not to be employed during the hours required for instruction nor during the hour immediately preceding such instruction, the employers being obliged to procure certificates from teachers indicating the regular attendance of such children in school; the hours of work to be limited so as not to interfere with the required teaching.

1890 (September 13). Bill, sanctioned by the King, dealing with modifications of the plan of study in secondary grades; more time to be given to modern languages and less to ancient languages.

1892 (July). Formation of Norwegian Elementary Teachers Association at Trondhjem; also of League of Norwegian Philologists and Scientists at Christiania (representing secondary education). Meeting of Pedagogical Society of Christiania, in November, to celebrate Comenius' life and work.

1894. Decree of June 12 places a teacher on the school committee in each city. In towns having thirty or more teachers, both men and women may be on the committee. In smaller towns either a man or woman may be elected to the position.

GENERAL FEATURES OF THE SCHOOL SYSTEM.[1]

The department of ecclesiastical affairs and public instruction (Kirke og Undervisnings Departmentet) has general control of the educational system, and furnishes a report every three years to the King and Storthing. Norway is divided into 77 deaneries, whose ecclesiastical authorities are vested with the higher inspection of schools and the control of school committees. The six dioceses have each a diocesan director and board, to whom the deans report. This directive board (Stiftsdirektion) includes the bishop, the chief county executive officer, and the school inspector, who is appointed by the King and paid by the State. The department of education expects an annual report from these higher school boards. For local supervision, each county has a council which acts as a county school board and meets annually; the chairmen of municipal councils are among its members. A school commission (Skolekommission) in each city or district, which includes as members the pastors and vicars of the parish, a member of the municipal council, and delegates of the communal council, has immediate supervision of schools. Each school district[2] is governed by dual authority, namely, by the school com-

[1] Lois du 26 Juin, 1899, sur l'École primaire; Larousse, Dictionnaire Universel, vol. 11; Beretningen om Skolevaesenets tilstand; Universitets og Skole annaler, etc.

[2] The ordinary school district has limits similar to the municipal district.

mittee, which includes women, and is purely administrative, and by the municipal council having charge of the school fund. Each rural district (Herred) is formed of one or more school communes[1] (Skolekommuner) subdivided into circles (Skolekredse), the size of which is determined by the communal school commission (Skolekommission).

Each circle is required to have an elementary school (Kredskole), or there are ambulatory schools (omgangsskoler) if the distances are too great for the children to come. Formerly there were many ambulatory schools, but by degrees they have been united with the stationary schools.

The different grades of schools include the elementary, divided into stationary (faste skoler) and ambulatory (omgangsskoler) and a higher grade elementary (höiere almueskoler), maintained by several Kredse.

Secondary schools established by the State include middle schools[2] (kommunale Middelskoler) and gymnasia, then there are subdivisions into Latin and real gymnasia (Latin og real skoler). Private schools of a secondary grade (privat borger og pigeskoler) are also reported.

The "Seminaria," or normal schools, are one for each diocese; all public school teachers (folkskolelaerere) are presumed to have passed the normal school examination.

The University at Christiania (Kongelige norske Frederiks Universitet); special schools for philological studies, physical and mathematical studies; mining and forestry schools; industrial (industriskoler) and commercial schools; agricultural schools in most counties; higher agricultural schools (höiere Landboiskole); navigation schools; military high schools; military and naval schools; the polytechnic, etc., complete the school system.

The schools are maintained by district, county, and State funds, the elementary schools being supported by a district school fund derived from interest funds, voluntary gifts, and fines; there are also State subsidies.

The twenty counties have each a school fund to pay the increase of salary to teachers, contributions to higher schools, and to work schools, to erect school houses and to purchase land for school teachers, to promote education in poor parishes, and to further compensate school teachers. City schools are supported by the municipal district; secondary schools are maintained by the municipality or by funds which have accrued to the department of public instruction and ecclesiastical affairs from the sale of church lands.

Sometimes the Latin schools have funds of their own, but the majority depend upon State and municipality. Normal schools are established and maintained by the Government. The university is

[1] A school district averages from 12 to 14 circles.

[2] These intermediate grades serve as a preparatory division to the secondary schools, and correspond in a measure to our grammar schools. Their course is referred to in the following pages.

maintained by the State or by its own funds, the student having no fees to pay. The agricultural schools are supported by State and district funds. For a summarization of the laws prior to 1889, see the Report of the Commissioner of Education for 1889–90, pages 477–481.

The modifications of former laws, apart from the local appointment of teachers and a possible reduction of school hours, were not of an extensive character.

Teachers are generally trained in one of six State normal schools or in a class of minor training schools (Laererskoler), attached to the higher elementary schools as a sort of practice course. Public school teachers are presumed to have passed an examination either in normal schools or elsewhere. The normal course comprises religion, the native tongue, arithmetic, music, geography, history, natural sciences, penmanship, drawing, and gymnastics; there are also practice schools. In city and rural schools, according to law of 1889, teachers can only be employed permanently when 20 years of age at least, speaking the language of the country, and members of the Evangelical Lutheran Church. If not engaged permanently they may be dismissed at the end of three months.

The settlement of teachers' pensions now depends on the local authorities, which pensions are voted as follows: 30 per cent of salary for ten years' service, 40 per cent for twenty years' service, 50 per cent for twenty-five years, 60 per cent for thirty years and upward. The teachers are required to secure annuities of 10 per cent to their widows and 20 per cent in case of an increase of 50 per cent of the teacher's salary before his 45th year.

STATISTICS FOR 1892 COMPARED WITH 1889.[1]

There are two distinct school laws in vogue in Norway, for city and for rural schools.

The context of these laws for 1889 was presented in the Report of the Commissioner for 1889–90, pages 481–486, and the reader is referred to that Report, although points of the law are found throughout this presentation. The statistics available when that essay was published were for 1888. That is the year prior to the promulgation of the law.

Compare them with those of 1892 or the close of the three years' period required for the adoption of that law by the city school authorities. In rural districts a five-year period was allowed.

The results of that law are here presented statistically. It is premised, however, that the effects were supposed to be felt more especially among the teaching fraternity, whose appointments depend on local boards, and in the course of study that of the rural schools being made to subserve the interests of a school population less alert

[1] Beretningen om skolevæsenets tilstand 1889–1892; Lois du 26 juin sur l'école primaire.

than that of the city. The gradations of the rural elementary schools are in two divisions; those of the city in three divisions.

The children of school age in 1889 numbered 318,585, or 16 per cent of the population (of 1880). In 1892 the school population was 356,114, or about 17 per cent of the population of 2,000,917 in 1891.

a Includes 434,149 crowns subsidy in conformity to rural school law.
b Abatement 124,719 crowns in the year 1889.
c Includes 341,700 State subsidy, conforming to city school law.
d In 1889 a State subsidy of 32,330 crowns was given to aid in carrying on schools in communes needing it; also of 14,459 crowns to aid teachers, the purpose of which is not specified.
e That is, of whole amount for schools in 1892 one-third came from Government funds.

OUTCOME OF LAW OF 1889 FROM THE STATISTICAL STANDPOINT.

An increase in enrollment in stationary schools in rural districts is noticed, with a decrease in the number of higher elementary schools, and in pupils attending schools in rural districts.

There is an increase in attendance in city schools of both elementary and secondary grades, while a decrease in the number of and attendance upon communal and higher schools is reported, although the girls in attendance have increased by 473, and in the secondary grades by 834.

Pupils in the lower-grade secondary schools increased and the tendency was toward instruction for practical life (Real schools) rather than to fulfill the requirements of the Latin gymnasia. The latter indicate decrease of 115; the former an increase of 60.

In normal schools the increased attendance of pupils is in the cities. Of the teaching force, an increase of 222 women teachers having full position and of 90 men is indicated.

Both rural and city districts received considerable subsidies from the State for carrying on the lower-grade schools. The increased amount in rural districts was $116,461 from State funds and $89,834 in cities.

Higher elementary schools in rural districts, county and evening schools decreased in number, or were possibly transformed into divisions of other schools, for there is decrease in expenditure. Communal middle schools and normal schools received an increase of funds from State and other sources. Increase in the stipends for traveling expenses and training courses for teachers, also in teachers' pensions is reported.

Art and manual training classes received larger amounts, while in industrial schools for girls, and apprenticeship schools there is a decreased endowment of $5,611. For military and gymnastic exercises the amount of increase is $1,608. University funds are also greatly augmented.

Viewed in toto the increased expenditures in 1892 over 1889 were $689,663, of which $189,622 were from State subsidies.

It is stated that "the number of children in public primary schools of Christiania at the end of the school year 1891–92 was 16,914, there being 547 in private schools of the same standard, of whom 539 were blind, deaf, or feeble-minded. There were 5,084 in private and public secondary schools; 242 received private tuition, and 126, of whom the majority were ill or mentally abnormal, received no instruction at all."[1]

Owing to the provisions of the new law for primary schools, the different school boards fixed the scale of payment for primary teachers. In many towns, especially in Christiania and Bergen, the salaries have been considerably raised.

[1] Journal of Education (London), May, 1892.

In Christiania the salaries of the so-called "second masters," who rank immediately below the school director, and of whom there is one for each school, have been fixed at $938, in addition to free lodging in the school. First-grade teachers receive $643 a year, female teachers only $388.60. Second-grade teachers, male and female, reach the same salary after fifteen years' service, their salary being increased every three years.

Another result of the new law is that a great many more masterships have been created in primary schools, for which, up to the present, there has been no lack of applicants, there having been a considerable surplus of trained teachers for several years.

The inference seems to be as follows: The Government is developing great interest in perfecting the school system; the teachers, both men and women, are to be completely trained to the duties of their position; opportunity is to be given them to study other school systems; training of both mind and body is a prerequisite to modern life, athletic sports being given a prominent place; the rural school problem is slowly being brought into conditions similar to those of the stationary schools of cities; school courses are to be arranged so as to bring about a more natural gravitation from elementary to secondary and higher courses, without too much strain upon the mental and physical development.

COURSES AND METHODS OF STUDY.[1]

Presented in extenso in the Report of the Commissioner of Education for 1889–1890, pages 500–510, the programme of study need not be repeated.

According to law of June 26, 1889, the special branches in city elementary schools are: Lowest division, religious instruction, Norwegian language, history, geography, arithmetic, writing, singing, gymnastic exercises, manual training for girls and boys; a continuation of the same in the second division, with manual training for both boys and girls, natural history, geometry, and drawing. In the highest (third) division, religious instruction, Norwegian language and history, with elementary studies concerning national institutions, natural history with elements of hygiene, arithmetic, and gymnastic exercises, also target practice.

In rural schools—law of 1889—the course includes religious instruction, Norwegian language, arithmetic, writing and singing, with oral instruction preparatory for the higher divisions. In the higher division the same studies; also geography, history, elements of instruction concerning national institutions, natural history, and the elements of hygiene, manual training, and physical exercises with target practice.

[1] Lois du 26 juin, 1889, sur l'école primaire; Udkast til en forandet Ordning af det höiere skolevæsen; Betænkning om Undervisningen i Latin og Græsk-af P. Voss; Vor Ungdom 1890–1895.

As in the city schools, backward children and those of feeble health are exempted from the full course, if the parents request it, and children of dissenters may omit the religious exercises. Special courses may be arranged, if permitted by the communal authorities for children who are incapable of taking the full course, the expense to be defrayed by the parents or guardians.

There may be optional courses in the higher division, but additional hours will be required and not more than six additional weeks a year are allowed. The studies are those of the elementary grades or similar ones. The duration of the continuation schools may be from one to six months.

In Norway, between the people's schools and gymnasia, there is an intermediate grade of school, the sixth-class middle school[1], based on a law of June, 1869, which aims to prepare for the gymnasia, and also to give a general education for practical life. There is an entrance examination, which has only been permissible to children who are fully 9 years of age, but, if suggestions of the Royal Commission be adopted, a change to 11 years of age may be made.

The secondary schools—Latin and real-gymnasia—endeavored to give a broader phase of education to the students, two-thirds of whom were Latin gymnasiasts and one-third real-gymnasiasts.

It is stated that—

The Royal Commission for Reform Movements in Secondary Schools has suggested a scheme for their better organization. In conformity with the express wish of the Storthing, secondary schools are in future to be a continuation of the elementary grades, and children are to receive elementary instruction till their eleventh year. As at present, secondary schools are to be divided into two divisions—middle schools and gymnasia. But while the pupil now enters the middle school at the age of 9 and remains there for six years, the new curriculum is to cover four years (from the eleventh to the fifteenth), that of the gymnasium extending, as now, from the fifteenth to the eighteenth. The Real-gymnasium is to undergo many alterations, but the Latin gymnasium is to be divided into two parallel divisions, with and without Greek. The requirements in Latin and mathematics are to be considerably reduced, while the native language, modern

With Class IV comes a subdivision into English (or Real) and Latin courses. In Classes V and VI German is studied for four hours in the Real and three in the Latin division; in Classes IV, V, and VI English is studied for five hours in the Real course, and Latin for seven hours in the Latin subdivision; in Class IV the Real-course drawing is studied two hours, and in Classes V and VI of the Latin course one hour each.

languages, geography, physics, and drawing are to receive much greater attention, and slöjd is to be made compulsory throughout the course of the middle school. This scheme was sent to the University of Christiania and to all public secondary schools, with the request that the professors and teachers comment upon it before the end of the year (1891) to the department of public instruction. The commission states that ancient languages take more time than necessary, that in middle schools there are too many subjects of instruction, and it requests a new gradation of studies.[1]

The university courses are liberal in character. For admission as a student, it is necessary to have passed the examen artium. Most of the candidates come from gymnasia and Real-schools, and are supposed to have a certificate from middle schools. The examining board, consisting of university professors, distinguishes between the "classiske examen artium" and the "real-artium," the latter being sufficient for those who intend following a course in mathematical, physical, and natural sciences; the former is required of those who enter the other faculties. There are five faculties; the faculty of philosophy has two divisions—that of historical and philosophical sciences and that of mathematical and natural sciences, the others being theology, law, and medicine. The length of course is six years in medicine, four in each of the other faculties. The courses of study in agricultural, military, technical, and industrial schools are not presented, but there are theoretical and practical courses aiming to produce a self-respecting and self-reliant people.

The blind and deaf mutes receive elementary instruction, and also education in certain trades. Defective children are tenderly cared for and, when possible, educated, the powers of observation being trained; the æsthetic side is cultivated through pictures, festivals, etc. They have practical gymnastic exercises.

Methods of study and recitations are as follows: The law implies that fifty or at most fifty-five minutes is long enough for the first recitations, and forty-five or forty minutes for later recitations. Recesses are interspersed with gymnastic exercises and singing.

The school is to be opened and closed with prayer, reading of Psalms or singing. The text-books are to contain nothing contrary to law, and no religious text-books can be employed other than those approved by the King. Instruction is to be given in the Norwegian language, although in the Tromsöe district[2] text-books in the Lapp and Finnish tongues may be used with those in the Norwegian language.

Promotion takes place from class to class and from grade to grade, after due examination, which occurs annually in the presence of the school committee, the parish clergyman, and other persons. All

[1] Journal of Education (London), May, 1892.

[2] In Finmark, on the island of Tromsöe, where the Lapp and Finnish tongues prevail.

children over 9 years of age are expected to take part whether they receive home instruction or attend public or private schools.

Pupils usually decide when in the middle-grade schools whether they intend to enter the Real-school or to follow the gymnasial course which prepares for the university, although pupils from both real-school and gymnasia are admitted to university faculties.

Saturday is a holiday; on other days not over six hours in school are allowable, and for fear of overpressure the commission studying this matter considers five hours enough for girls.

Three recesses are usually taken, two of ten minutes each and one of twenty minutes. Holidays and vacations cover twelve weeks annually, although they may be extended to sixteen weeks in cities, if the authorities so decide.

TEACHERS' ASSOCIATIONS.[1]

In July, 1892, at a well-attended meeting at Trondhjem, there was formed the first union of Norwegian elementary teachers. In the same month representatives of secondary and higher schools met in Christiania and formed the League of Norwegian Philologists and Scientists, the object of which is to promote the economic and social interests of the masters. The managing committee consists of seven persons, three of whom are chosen from among teachers of provincial schools. Only graduates of philology and science are strictly entitled to membership, though the committee has the power of admitting such nongraduates as hold appointments in secondary schools. A meeting is to be held at least once in three years, and in the meantime the committee informs the members by circular of matters of general interest. The league is to be the organ of teachers of secondary schools, and has already on two occasions sent in a protest to the department of public instruction against the appointment of principal teachers not possessing such qualifications as have previously been declared essential by the department itself.

On the 15th of November the Pedagogical Society of Christiania held a Comenius festival, the day of his death having been selected instead of that of his birth, as the latter occurred during vacation. Among the numerous guests were the prime minister, the minister and ex-minister of public instruction, and other distinguished people. Mr. Anderson, principal of a private secondary school in Christiania, delivered the chief discourse. He gave a summary of Comenius's life and work, declared it to be one of his chief merits to have placed higher instruction on a national basis, and pointed out how we, three centuries after, have not yet realized, far less distanced, his educational ideals. In conclusion he said:

There is scarcely a pedagogic truth or didatic rule of the present day upon which

[1] Vor Ungdom, 1893-1895; Revue Internationale de l' Enseignement, 15 Décembre, 1893; Journal of Education (London), April 1, 1893, page 203.

Comenius has not expressed an opinion, so full of vitality were his ideas, and therefore so profitable. To press steadily forward, that alone is the way to honor his memory.

The Rev. Mr. Romer, of the United Brethren, next delivered a lecture on "Comenius's Ecclesiastical Career," suggesting that his profession might possibly have had its share in making him the great pedagogue that he was. He then gave a very interesting elucidation of the growth of the United Brethren and of Comenius's life as a teacher, clergyman, and bishop.

PHYSICAL TRAINING IN NORWAY.[1]

The movement in favor of physical education, which has extended all over Europe, had special development in Norway. It commenced in the hospitals, in councils of revision, in statistical lectures on medical subjects. The effort was made through scientific and hygienic investigation to train children physically.

The physicians have undertaken the medical supervision of generations to come. The Government intended to order the examination of all school children in Norway, but the gathering together of facts was commenced in the public and people's schools. Papers were prepared for each school, so that the answers of each pupil to questions similar to the following could be compiled:

What are the hours of recreation, of class recitation, for singing and gymnastics? How many hours a day must the pupil work at home in order to prepare the lessons indicated by the teacher? The size, weight, and height of pupil? Is he afflicted with nervous diseases, headaches, bleeding at the nose? Has he lung troubles, scrofula? Is he anæmic? Has he curvature of the spine, etc.?

The hygienic conditions of the school; the health of parents; the general appearance of the pupil; age of father and mother; what are the hygienic conditions of the home? Are the maladies with which the children are afflicted due to home or school surroundings?

In August, 1892, some 2,000 children (one-third girls) had submitted to these investigations, each one having been before the board of inspection three times, so that fairly correct records could be kept. Many considered these examinations to be an encroachment upon individual liberty, and in most cases the requests were handed to the family physician. Sometimes the answers regarding the health of parents, etc., were omitted, but the answers were such that it was possible to obtain information concerning the effects of hereditary and school influences upon the young Norwegians.

Deplorable hygienic conditions were found. The long winters, when windows were not open to admit the air, the conditions of drainage, the horrors of alcoholism, all were investigated.

---

[1] Condensed from article by Hugues de Roux in Revue Pédagogique, août, 1895, pages 143–155.

It is stated that physical training in these northern countries has been of such a character that it fortified and hardened the child, so that, for instance, if he were stranded on a desert island he might be prepared for such emergency.

Exercise with the "ski," or snowshoe, is in vogue instead of skating, and frequently a hundred kilometers can be covered in twelve hours.

Even the dance is not a mere desultory pleasurable movement, but becomes a violent exercise with the Norwegians. The whole training of the child is toward self-reliance. Some idea of this training may be obtained from the fact that a child of 8 and one of 4 years may be out driving; the vehicle is overturned; they unharness the pony, lift the cart, mend the break, and start off again. Such is the practical kind of training that is given even to the youngest members of the family circle.

The present movement is to more thoroughly elucidate modern ideas of physical culture, which tend to form an athletic body of people, and this movement is watched with interest, as it is conceded that the Scandinavians have degenerated physically when compared with past periods of history, when, in point of corporal strength, they were recognized as the masters of Europe (les maïtres de l'Europe).

One of the sources of this physical degeneration is said to be the lack of properly prepared food, and the northern races have suffered from this cause. So neglected has this branch of domestic service become that of late years classes in cooking have been established in most of the schools. Each girl in the elementary grades is given a sum of money by the mistress to buy what would be required for a meal. In addition to a practical display of the instruction given, her accounts are rendered on the blackboard, and thus serve as an arithmetic lesson for the whole school. Through experience the girls learn where the little economies come in from day to day. Girls of good families go into the cooking schools to be instructed in domestic economy.

The practical good sense demonstrated by the parents in thus giving their daughters, no matter what their class of society, an opportunity to thoroughly train themselves in the art of cooking is indicated. It has been said that the taste for stimulants[1] has been greatly enhanced by the lack of nutritious food, hence this branch of teaching in elementary grades tends toward preparing a home table so tasteful in quality that even the need of going to a general "Damp-Kjøkken," for sundry nutritious foods will be no longer felt, and little by little the cause of alcoholism will be pushed farther away until the people

[1] In 1833 statistics assigned to each Norwegian (women and children included) 16 quarts of brandy per capita per year, and this was simply an average. In 1875 the figures had decreased to 6 quarts and a fraction, but the evil aggravated by heredity had taken deep root amongst the people of that cold climate. (Revue Pédagogique, août 1895, p. 146.)

again stand before the world as a hardy, strong race, with no indications of the possible degeneration of physical force which some writers indicate to be their normal condition.

COEDUCATION AND THE TRANSITION PERIOD.

An interesting report on the coeducational movement was presented in 1895 to the minister of ecclesiastical affairs and public instruction of Norway by Hulda Hansen.[1] A condensation of that report is here presented, as it clearly indicates the trend of modern educational movements in Norway.

The Norwegian school system is for the time being in a transition state. The people's school is a communal school, the higher grade schools are in part communal, in part public,[2] and they embrace the following divisions: A preparatory division (three classes), a middle school (six classes), and a gymnasium (three classes), which has Real and Latin sections. As in the other Scandinavian lands, Norway arranged its schools, from the Reformation period on, upon the basis that boys were to be trained for citizenship while a girl's life was centered in the home and family. The schools for boys carried on their education from childhood to manhood, while, as a rule, the instruction of girls was limited to the most elementary branches. In course of time girls demanded a higher grade of education, or at least such as could be obtained in the grammar or "middelskole." In 1877 the principal of a private school for girls presented a request to the department of education for the promulgation of a law permitting middle school examinations for girls. At that date it was considered by the authorities that such action would bring the education of girls outside the woman's sphere.

However, in 1884 the Storthing decided more advantageously for woman and the authorities of several communes requested a State subsidy to carry on a grammar (middelskole) school of a coeducational character. From that date on the discussions in the Storthing and among the educational authorities being quite earnest in character, it was decided not to put any hindrance in the way of coeducation in communal, middle, or State schools. The coeducational schools render a more complete class division possible and more extended instruction for both sexes.

The local school officials have interested themselves in the matter. In the smallest towns, where economic conditions have to be considered, the authorities have proven the value of each step, new methods have been tried and the authorities have cast aside whatever did not produce good results, and they have introduced as a part of the system whatever seemed most satisfactory. These experiments rendered it possible for Mr. Knudsen, the chief official of the Norwegian school

[1] Vor Ungdom, Haefte 1-2, 1895: Résumé of report to the minister of public instruction and ecclesiastical affairs, by Hulda Hansen.

[2] Governmental or State schools.

system, to arrange that there should be no absolute uniformity in methods, but that the best be chosen. The central authorities have observed these different efforts and have adopted whatever seemed best for the whole school system.

As an outcome of these investigations, coeducation was introduced into a private school in Christiania, into some of the public Latin schools, and into twenty communal schools; also in several private high-grade schools in Christiania, where young girls are studying for the gymnasia, and in the highest class of middle schools in places where for the time being there are no girls' schools of this grade.

Many educators have interested themselves in the last few years in reforms in higher and lower schools for girls, and it is thoroughly understood that the schools have claims which should receive attention. Both boys and girls have a right to expect aid from the State in obtaining a classical education. In that respect there is unity of sentiment. Some individuals take the ground that it is preferable to have the education go on in the old way, others discussed economic and moral phases.

As for the intellectual side, coeducation has shown very clearly that a girl's intelligence is fully equal to that of a boy. Special aptitude for language has been noticed among girls in some schools but less aptitude for physics and mathematics; in other schools the reverse is the case. To date, more girls are found in the Real gymnasia than in the Latin gymnasia, for as yet girls are apprehensive as to the outcome of the study of mathematics and natural sciences. While it is observed that they are especially studious, yet they have less confidence than boys. Their industry has a good effect, however, upon the boys, and, in studying together, more rational methods of study are noticeable. Of course there is a difference in individuals, but there is no hindrance to the giving an equally thorough education to both.

There is said to be danger that girls will exert every faculty for little purpose, because they are outnumbered by the boys, but these proportions will equalize themselves gradually.

The following figures are presented in various years at middle-school examinations:

Year.	Boys.	Girls.	Year.	Boys.	Girls.
1890	793	315	1892	850	401
1891	863	359	1893	953	450

For the examen artium the figures were as follows:

Years.	Students.	Of these, girls.	Years.	Students.	Of these, girls.
1889	268	14	1892	255	16
1890	249	16	1893	213	9
1891	236	12			

If, then, coeducation is permissible from the intellectual side, there is still another side—the moral—and teachers admit that there seems to be no bad influence in thus educating boys and girls together. A species of cameraderie is engendered by this mingling day by day in school; courtesy is as apparent in the school as elsewhere. The presence of boys does not tend to produce coarseness among the girls, but their presence has a refining home influence upon the boys.

In 1890 the department of education and ecclesiastical affairs requested a report from institutions which had tried coeducation, so as to determine upon the merits or demerits of the system. No school demanded its abolishment, but each school indicated that such form of education is more economical, and from the pedagogical standpoint is warrantable.

The general complaint has been that teachers are not thoroughly trained to carry on coeducational establishments; but the school authorities are strenuously endeavoring to improve this condition of affairs. A drawback to the coeducational middle-grade schools has been the seven-year course for girls and the six-year course for boys. The health of the girls was found to be so excellent that it seemed desirable to do away with the upper class for girls and to allow the boys and girls to pursue their studies throughout the course together, and to arrange the middle-school examinations in accordance with this plan.

The investigations concerning coeducational schools proved that girls suffered more than boys when the hygienic conditions were not satisfactory; that they have less power of resistance than boys when epidemics break out, and that overpressure of work has more lasting effect upon the organism of girls than upon boys. In the Latin and real coeducational schools of Frau Roque Mielsen the thirty hours of school work are similar for both boys and girls. There is a separate upper class for girls who desire to continue a course of study leading to the middle-school examination, or, if the girls prefer, they enter the sixth class with the boys. Domestic economy and feminine handiwork enter into the course for girls. In the middle-grade schools it is not considered advisable to limit the mathematical course or to supplant it with work of more interest to women.

The number of hours per week is thirty (boys have thirty-four hours), and slöjd, gymnastics, and singing are included for all.

According to Royal decree of February 23, 1889, two higher schools[1] for girls have a right to hold the middle-school examination. In some of the schools the examinations take place after the ninth year. In the tenth class the course of study is as follows: Norwegian, French, English, and German, two hours each; arithmetic, four hours; phys-

[1] Those of the Misses Wolfsberg and Bordaes in Drammen and of Miss Storm in Trondhjem.

ics, chemistry, dietetics, and domestic economy, six hours; history and manual training, two hours each; singing, one hour.

The girls' schools have good hygienic arrangements; the maximum in a class is 30; in the schools from 200 to 300 pupils; annual school fees from 50 to 200 or 240 crowns ($13.40 to $53.60 or $64.32), which is similar to the private higher schools for boys. In proof of the fact that higher-grade study is not detrimental to the health of girls, it is stated that in the higher-grade schools (coeducational or separate) of 1,500 girls none had curvature of the spine in a degree which required support. Arrangements are made so that students can have warm milk or chocolate if they prefer for lunch at school rather than to return home. In the normal schools of Norway, four of which are city normals, coeducation is a pronounced success. In the Asker normal school, 2 miles from Christiania, there are 18 men and 32 women students. In gymnastics and manual training separate instruction is given. There are two years allowed for finishing the course, but the practice years bring the courses up to six years.

In Norway women teachers have a significant place in school work; in schools for girls and coeducational schools they teach even in the highest classes, and their worth is especially noticeable in the people's schools. The need of a higher normal school for women is greatly felt. In order to perfect women in special branches for the higher grade schools a private normal school was established by School Director Berg in Christiania. To be admitted to the first division of this school the passing of the middle school examination is requisite.[1] In this lowest division there is freedom of choice in studies. To enter the second division the examen artium is necessary, or a successful course in the first division, or several years practice as teacher (which would indicate satisfactory knowledge). From this division one may select course A, B, or C.[2]

The outcome of the interest in coeducation and the strong democratic movements rise to modification of higher school work.

In 1890 a royal commission was appointed to revise regulations governing the higher schools.

The question of the organic connection between the people's school and the higher school is emphasized by the commission, a completion

[1] This middle school, or intermediate grade, has six classes, and leads generally to the gymnasia or Real gymnasia. The course of instruction covers religion, mother tongue, history, geography, arithmetic, and writing; the second half year, German; one term later, natural sciences and drawing; a year later, geometry. With the fourth year the pupil chooses whether he will follow the Latin or English course; the former leads to the gymnasia, the latter is equivalent in part to the courses leading to Real-schools, Real-gymnasia, etc. French begins with the fifth year, but it is optional.

[2] A: Religion, Norwegian, history, geography. B: Norwegian, English, German, or a reasonable amount of French. C: Physics, chemistry, natural history, mathematics, and arithmetic.

of the common-school course being recognized as necessary preparation for the higher schools; the commission also stated that foreign languages could be put aside two years or more to some higher division. Certain members considered that the foreign languages should be transferred to the middle school course (from 11 years on), while the minority considered that such transfer would satisfy the great number of pupils who do not aim to enter the gymnasia.

The commission considered eighteen hours to be sufficient for study of the mother tongue in four classes of the middle schools (that course has taken from twelve to thirteen hours in the three years' gymnasium). Of the foreign languages, the lowest class in the middle school has German only, and English or Latin may be taken up thereafter; the minority advanced good reasons for taking up English rather than German; forty hours is devoted to Latin, to Greek twelve (it was proposed, as an exception, to have a three years' Greek course of twenty hours, the Christiania Cathedral school being the objective point of such suggestion). Different views were held in regard to Latin; School Director P. Voss said for sake of discipline there should be at least thirty hours of Latin reading in the gymnasia.

The commission advocated the need of practical arithmetic, and in natural sciences, the need of more familiarity with the book of nature. Some believed that chemistry and physics come more aptly within the circle of a child's knowledge; others place the principle of sanitation and health first.

There are therefore no new problems respecting the advancement in physics, but the tendency is to reduce the number of daily lessons; to have a new division of the courses and of the examinations; to give more stress to athletic exercises, and to approximate slöjd and gymnastic exercises. All suggestions lead to middle school examinations and the artium.

For girls' higher schools, girls' schools and coeducational institutions, the commission suggests distinct programmes of study. The minority decided for complete coeducation as a part of the State school system, and all considered that experience favored coeducation. The commission favored similar appointment for men and women in communal and public high schools.

The minority suggested the giving women teachers an examination of the second grade, which would prove their qualifications for a two or three years' course in university studies.

REVIEW OF EDUCATIONAL CURRENTS OF THOUGHT IN 1895 IN CENTRAL EUROPE.

Since the death of Kehr in Halberstadt, Dittes in Vienna, and other educational leaders in central Europe, other men occupying commanding positions have taken up their work, and in the German National Teachers' Association and the educational press defend the idea of popular education, and particularly the plans and principles of Pestalozzi. Mr. H. Scherer, school inspector in Worms, is now regarded as one of the prominent leaders of the German teachers, hence it would seem proper to quote him on the subject of educational currents in Germany. The article which is here inserted in English translation is the leading article of Richter's "Pädagogischer Jahresbericht" of 1895. It must be understood that there is much more scientific discussion on educational systems in Germany than is generally known, chiefly caused by the prominence Herbart's theories have attained. The outspoken defenders of Pestalozzi, as was seen in the article, "Is German pedagogy in a state of decomposition?" published in the Annual Report of the Commissioner of Education of 1893–94, are apprehensive of seeing Pestalozzi's influence supplanted by that of Herbart. Scherer represents Pestalozzi and that school which was founded on his principles, while Rein, to whom he naturally turns first, defends and advocates the pedagogy of Herbart and his disciples. The article of Scherer is as follows:

Test all, keep the good, and should anything better mature within you, add it in the spirit of love and truth to what I have tried to give you in the same spirit; at least, do not cast aside all my life's efforts as something that is done and needs no further test. Truly, my work is unfinished and needs serious examination, and not merely because I request it.

With these words, the past master of German school pedagogy and German public education, Father Pestalozzi, closed his last work, his swan's song. It is his last will, his pedagogical legacy to his successors; Harnisch and Diesterweg, Herbart and Beneke, Ziller and Dittes, Dörpfeld and Kehr, and many other learned men and teachers have worked at its fulfillment. Still their labor goes on, and yet the work is unfinished. The one hundred and fiftieth anniversary of the master's birthday invites everyone who is working to carry out his will, in developing the theory and practice of education according to the sense and spirit of the master, to examine all that has been accomplished in the fulfillment of Pestalozzi's pedagogical testament, and to see what task is set before the teachers of our time in regard to the further development of the science and art of pedagogy in the sense and spirit of Pestalozzi.

Pestalozzi invites us to an earnest test of his principles, so that the transient may be separated from the lasting, the accidental from the essential, that the former may be set aside and the latter developed toward ultimate perfection. This test is necessary for a firm foundation of the science of education and art of teaching; for, despite his genial and tolerant nature, Pestalozzi was a man with human faults and weaknesses. As a product of his time, his development, the formation of his views of life and the world, and hence also his educational opinions, were influenced by the spirit, science, art, and philsophy of his time.

In studying the advancement of the science of education we must first of all learn to know the history of pedagogical development in its connection with the development of culture and intellectual life, and understand the development itself in this sense; for, as intellectual movements that have once become powerful and influential never die out, but continue to affect future generations in some way, the thought and action of the present time is to be understood only by a study of the past. The formations of the present are determined by those of the past.

If pedagogy is more than a systematically arranged body of rules for school education; if it is a science and an art which by conclusive tests gives us a theory of art founded firmly on science (by means of which an intentional and regular education of mankind, according to both nature and civilization, is made possible), it must be studied from this point of view. If education is more than an intentional and well-planned directive action, which makes the individual attain a natural and civilizing development; if education also strives to make the individual a member of the social body, it must be regarded as a science and history of development which stands in closest connection with that of social culture and national intellectual life—which life reacts upon education and influences the formation of educational systems.

Twenty years have passed since the appearance of the last edition of Dr. Karl Schmidt's Geschichte der Pädagogik in weltgeschichtlicher Entwicklung und im organischen Zusammenhange mit dem Kulturleben der Völker. Since that time much has been contributed to this subject, and we do not think that Professor Rein is justified in saying in his introduction to his Encyklopädisches Handbuch der Pädagogik that—

> In the province of historical pedagogy we are just at the beginning of scientific work. First the earliest references must be looked up and sifted, then written up in monographs in which the intellectual movements of the period in question are brought out, before a well-founded scientific condensation of facts can be effected.

The same remarks apply to every scientific, especially to every historic, condensation of facts. In every case the condensation will be the more successful the more carefully and completely the sources of information have been examined. In the history of pedagogy, as applied to elementary education and to public-school systems, much has been done in the last twenty-five years, particularly in regard to research and the examination and revision of early references. Classic works of educators of the past have been published anew as original sources, the matters contained in them having been sifted and the essential and valuable separated from the accidental and worthless, and the authors' place with reference to the social culture and intellectual life of their times has been defined by prefacing their works by fitting introductions. The publication of school regulations, statutes

and histories of separate States and cities, has finally furnished the material for an almost complete history of schools.

There are still many deficiencies, it is true. Much work remains to be done, and many a valuable source of information must be made accessible. On the other hand, in some cases the mark has been overreached and many worthless rocks have been dug up instead of ore, owing to the religious bias of the compilers. A careful separation of the valuable and essential from the worthless and accidental is positively necessary. In this case scientific and not religious considerations must decide.

With the aid of these early references of pedagogy and the history of schools, in connection with the history of social culture and intellectual life, our time can produce a comprehensive work on the history of educational development and school systems in which the causal connection between social culture, or intellectual life, and pedagogical theory and practice is clearly and definitely set forth. The history of civilization, therefore, becomes auxiliary to pedagogy.

"Science and schools," says Professor Faulmann, in his History of Sciences, "have challenged each other; science gives to schools better matters and better teachers. Schools give to science better disciples. This examination of pedagogy brings us to a clear perception of the fact that educational development is a distinct branch of the development in general of all social culture, and that it is intimately associated with the philosophical views of life and the universe. Parallel with these changes, ramifications, and the expansion of philosophical views during the course of centuries the problem of education has been differently understood during different periods, and different solutions have been advanced."[1]

Only when the history of pedagogy begins to deal with the facts underlying theory and practice in connection with the intellectual movements and currents that give direction to educational activity can the historian of pedagogy give a true idea of its development; then alone can he judge individuals, thought, and separate facts from the standpoint of the civilization of the time; then alone can he judge the master, together with his disciples and antagonists, during and after his time; then, and then alone, can we understand the pedagogical phenomena of the present and comprehend them in their origin and development; only then can pedagogical science render its best service to pedagogical practice, to the educator and teacher.

"When it shows the teacher," says Professor Ziegler in his History of Pedagogy, "how deeply rooted are the regulations which he must carry out, and that they are most intimately connected with the culture of his nation, he will reverence them and interpret them correctly. He thus learns that they can not be set aside or changed at the option of any one individual, be he the mightiest in the land, and that their arbitrary violation or sudden change can not take place without great detriment to the whole system."

From such a presentation of the history of educational development we shall clearly recognize, on the one hand, that many a thought comes to light in the changes of theories and methods at present as altogether new, whereas they have been presented before and have not stood the practical test, because they were intrinsically wrong or, perhaps, the time was not ripe or not fully prepared for their comprehension and practical application, or perhaps these ideas failed owing to the obstacles put in their way by the animosity and jealousy of favored cotemporaries, who either saw their position endangered by a new doctrine which they failed to understand or practically carry out, or because they feared to be aroused from a sweet, dreamy existence.

[1] Sieler: "Fichte's views on pedagogy as applied to public schools."

On the other hand, we also recognize that every civilization is governed by an evolutionary development from the imperfect toward the perfect; that, therefore, all our views on education and teaching and school systems are subject to constant change for the better. It is a sign of a want of historical understanding to suppose that any man, be he Herbart or Pestalozzi, Ziller or Diesterweg, Dörpfeld or Dittes, has framed something totally new, the highest and best for all times, and beyond which there is no progress possible.

The intellectual greatness of a man consists in his understanding more clearly than others the moving powers of the intellectual progress of his time and in collecting these powers within himself, and being thereby enabled to define or change their direction by his own strength of mind in so far as it is possible within the line of the popular will.

True pedagogy is progressive pedagogy, which advances with the development of social culture and intellectual life.

Should we find that once again a period has become "old" and that a new one draws near, we can not in consequence conceal the fact that this new period will manifest other needs, will define other aims for their satisfaction, and will seek and devise other means for the attainment of these aims. However, this thought will not depress us. We shall try to understand it, and do our duty with a certain resignation during the unfavorable transition period. In the service of the old, but with knowledge of the direction that points out the new to be followed, let us resolve upon vindicating what exists, but not restrict ourselves to it because it has been tried and still exists; for, truly, all that is, is not within reason, and not all that is, deserves to be counted worthy to be. (Professor Ziegler.)

Such a history of pedagogical development leads us up to present times, consequently acquaints us with the present currents, with present aspiration and actual work in the field of pedagogy and its auxiliary sciences. The farther we are away from the civilization and intellectual life of the past, or the looser its causal connection is with the civilization of the present, the less consideration will be given to its pedagogy and school systems. On the other hand, the nearer we approach the present, and the more organically civilization and intellectual life, including its pedagogy and school systems, are connected with the phenomena of our times, the more minutely must we observe these phenomena. Therefore the entire civilization and intellectual life of pedagogy and school of the present century, which begins with the appearance of Kant, Goethe, Schiller, and Pestalozzi, will receive the greater part of our attention.

The present duty of pedagogy, as a science and an art, is to perfect this history of educational development on every side to the present day, to frame a system of education based on this fundamental work, and to molding the education and teaching of our times. In this work we are supported by all who are occupied with the construction and development of the fundamental and auxiliary sciences of pedagogy. To these belong all the sciences, for they all bear some relation to education. They acquaint us either with the object, end, and course, or with the conditions and means of a natural and scientific education and culture. The histories of philosophy and anthropology, dietetics, logic, and ethics belong to the fundamental sciences of pedagogy, which acquaint us with the object, end, and course of education and culture.

Anthropology investigates the ground in which the foundation is laid; dietetics, logic, and ethics define the structure that is to be reared. The fundamental sciences have risen during the second half of the present century, and their rise must influence pedagogy even unto further future development. This rise is also traceable to the

rise of natural philosophy, brought about particularly by Darwin and his disciples, which influenced physiology and indirectly psychology. As man is a distinct form in the evolution of organic life, so body and soul are endowed with evolutionary powers which man has the ability to understand. Furthermore, it can not be denied that, within certain limits, the soul-life of a child develops in an analogous manner to the soul-life of the animal, and that the only difference between the development of man and animals lies in the tempo and degree of later realizations of the acts of memory.

In the beginning, and particularly by Moleschott and kindred writers, the results of investigation in natural philosophy and physiology were made to subserve the materialism born of the meager idealism of Hegel's philosophy; soon after, however, Lotze, Fechner, and others, quoted them in support of purely idealistic philosophy. Actually, scientific psychological investigation was begun by Herbart and Beneke by the establishment of a system of psychology in which the old theory of "faculties of the mind" found no place. Both have shown the course which this science must pursue to be successful in further expansion. This course can not merely be a collection of observations, but must frame laws by which psychological occurrences can be explained. But we must not forget that the psychology of Herbart, based as it is upon metaphysics and governed by laws founded only on mathematics, modified by the philosophy and science of his time, has a tendency to be one-sided and fragmentary, so that, to-day, it can no longer be accepted as the scientific psychology which meets the demands of our time. "We can hardly consent now to the proposition that psychology must rest on mathematics." (Heinrich, in "Die moderne physiologische Psychologie.")

On the other hand, psychological laws can not be developed from mental phenomena, purely as such.

Efforts have proved that it is impossible to establish a system which from the very beginning developed from psychological principles alone and in conformity with psychological laws. There can be no laws which may be defined as unqualified psychological laws, or for which there can be any other foundation than the physiological action in the human nervous system. (Heinrich: "Die moderne physiologische Psychologie.")

Natural science, and particularly physiology, must furnish the foundation for psychology. From them, and not from metaphysics and mathematics, as a basis, psychological laws must arise. Beneke already pursued this course in psychological investigation and thus constructed a psychology which meets the present demands of scientific investigation much better than that of Herbart. However, in this case also, owing to the prevailing philosophy and science of his time, metaphysical speculations play an important rôle in Beneke's psychology, and interfere with its advancement in conjunction with the progress of natural science and the philosophy of our times. The all-powerful influence of the then prevailing philosophy, under which Beneke fought his battle for existence, prevented the development of his psychology, if it is possible for a finished system to develop. The rapid growth of natural science in late years, combined with the great impetus of discoveries of facts and methods has infused new life into philosophy and more especially into psychology and ethics. The labors in the field of physiology particularly exerted a direct influence on psychology.

We have already mentioned Lotze as breaking the way for modern purely ideal philosophy, in which physiological investigation becomes

more and more independent of metaphysical speculation and brings new facts constantly to light and endeavors to approach nearer the first cause of psychological phenomena and laws with the help of physiology. Physiological psychology, which makes use of experiments in its investigations and looks up, establishes, and fixes its laws according to scientific methods, offers the firmest foundation possible. Wundt, Ziehen and Külpe, after Lotze, have been actively engaged in the development of this psychology. They justify real and ideal demands, show the reciprocal action between the physical and psychical, and at the same time observe the relative independence of each of the two sciences. They base their laws upon the results of experiments and not upon metaphysical speculation, and do not prevent the philosophical condensation of acquired cognition into a finished system. That which is to be desired has not been attained throughout. That many errors are interspersed, many omissions to be supplied, and many problems yet to be solved, no one will dispute. Neither can it be denied that in the zeal of scientific investigation, and under pressure of one-sided idealism, and its resultant one-sided realism, the normal mark was overreached and the structure in its foundation was supposed to be complete.

To completely displace and supplant the earlier method of self-observation by the experimental method is certainly an erroneous procedure. But this overvaluation has already been recognized, and the "subjective linguistic method," dependent upon observation of self and others, has received due consideration in connection with the experimental "psycho-physical method," so that it is reasonable to hope that a complete and true idea of the development of the human soul may yet be obtained. In this way we shall arrive at a psychology which derives its laws from material experimentally acquired without regard to metaphysical presuppositions, as these observations essentially refer to the same individual, and every report of an observation is immediately controlled by many. The resulting laws are, in consequence, incontrovertible. The hypotheses, still necessary for the uninterrupted development of this psychology, do not directly affect the laws acquired; they are of importance to the psychological investigator only, and not to the practical educator, for whom psychology is only an auxiliary science.

Pedagogy has a large interest in the establishment of such a psychology, so that it may receive a firm foundation and become a science in the true sense of the term, treating of the intellectual development of the child and of the art and manner of taking hold of his development with clearly understood purpose and well-defined regularity and directing it, mainly by instruction, toward its ethical end. But even at the present day empiric physiological psychology gives to pedagogy so many positive fixed laws, derived from facts gained by observation, that it may be very well satisfied with their realization. Empiric psychology teaches that thought and action primarily depend upon sensations or impressions through the senses; hence pedagogy must give particular attention to a well-designed and systematic selection and order of sense perceptions and their consequent conceptions. How instructive for the teacher is the fact, brought to light by experimental examination, that if the mind is fixed upon a particular impression and, consequently, is in a state of attention and expectation, the process of clear perception is reduced to a minimal limit of time. How promising for the teacher are the experimental investigations of association and associative reproduction. If empiric psychology

teaches that there are no innate and independent emotions, but that emotions are connected with thought perceptions and are called into being together with them and that every idea receives its emotional strength from the impression which produced it, it becomes evident that a suitable selection of sensations must definitely influence the emotional life of the child, which fact the educator must consider. And if empiric psychology teaches that actions are governed by the laws of association and are determined by the selection and combination of present and former sensations, pedagogy must give special attention to the selection and combination of sensations in order to control the actions of the child in the widest range.

These few examples show how significant present empiric psychology, upon a physiological basis, is for the educator. Of course there can be no question of a thorough transformation of pedagogy upon the ground of physiological psychology; as it has given to earlier empiric psychology a firm basis, and developed it, so there will be only a further development of pedagogy. As it is in psychology, as in fact, in every other science, there are and will forever be deficiencies and unsolved problems, so, in the future, there will be unsolved problems in pedagogy, concerning which one must be content with mere experience. The efforts of educators in behalf of psychology should tend to create works which, with original work of investigators as references, will treat minutely those psychologic subjects which are of vital importance to the practical work of training and teaching. Other points, of relatively less value, may be passed over with a mere mention.

The highest aim of philosophy is always the acquirement of a view of the world (Weltanschauung) which meets the want of the human mind according to the subordination of unities under comprehensive, theoretical, and practical points of view, says Professor Hochegger, whose recent death was most untimely for the science in question. This view of the world must culminate in a knowledge of the order of the moral world and must lead to moral actions. Intellectual philosophy—logic—points out the way for correct cognition of the world; moral philosophy—ethics—points out the road for moral action. The development of logic and ethics is influenced by the development of psychology upon the firm basis of natural science, for both are children of psychology. While logic deals with the individual, who is the first object of the educator's study, ethics acquaints us with mankind and the laws of ethical development to which mankind in general gives expression. The former defines the course of individual, the latter the course of social education. Lotze and Wundt pursued a new course in logic. Other investigators, as Sigwart, Schuppe, and Dorner, also hold prominent places in the development of these sciences. The scientific method, which begins with induction and then proceeds to deduction, has proven to be beneficial to psychology also. The advancement of logic was, in this respect, furthered by the development of the separate sciences, which had in the meantime made great strides forward.

The methods for the natural sciences, arranged conformably to wide experience and the results of numerous efforts, can, by careful generalization (omitting what pertains to the individuality of the separate branches), define principles applicable to every kind of investigation, and which, if properly modified, can enrich and clarify all the distinct branches of science. By a comparison of the methods of investigation established in the different fields of science a clear mind must surely arrive at clear and surprising results and certain fundamental principles, which prove that discoveries made from too slender premises are partial errors

or unnecessary time-wasting byways. The principles and methods thus newly found must, moreover, apply to practical life and the schools, and be improvements upon the methods in vogue. (Ehrat: The importance of logic to science, school, and life.)

Logic, therefore, aims at the development of a view by which the world of phenomena can be actually understood and the truth found. It endeavors to prove that by proper perception, consideration, and comparative observation, by an arrangement and adjustment under definitions (consequently by critical judgment and conclusion), and by convincing argument and reliable development of a scientific system (by means of continued and strict induction, deduction, and classification) science originates, and a proper view of the world can be gained and made perceptible.

Such a logic will show how the growing human being must be directed so that the physical and psychical germs of possibilities of a later development within him may grow toward perfection, and that his whole earthly existence may present the realization of ethical and esthetic ideals. It therefore points out the course to be pursued by individual training and outlines the duties of social education, which, in its ultimate aims, is more definitely defined by ethics. It is the duty of the teacher, therefore, to see that upon the foundation of the original work of the expounders of this science, a logic be prepared in which all useless ballast from formal logic (i. e., table of categories, division of judgments, according to the quantity of subject, the quality of predicate, syllogisms, modes, etc.), is omitted, and a scientific methodology (induction, deduction, etc.), be founded on the basis of the qualities and laws of human thought which have been made objects of perception by psychology. Upon the basis of such a logic alone can pedagogy establish the laws of intellectual education and found a pedagogical methodology.

Paulsen, Dorner, and others are associated with Lotze and Wundt in the development of ethics. On the one hand, the effort has been made to define the connection between ethics and psychology, metaphysics, and religious philosophy; on the other hand, the independence of moral laws and their relative independence of these sciences have been maintained; and they have been applied to human action in the different vocations of life. The laws are to be abstracted from the facts of moral life; hence the process of defining the laws is empiric. The moral laws already in existence and tested by moral acts must be defined and established, and applied to the action of man individually and collectively. The view of the world, derived from scientific logic, shows that in the entire world a great, uniform, uninterrupted, progressive movement takes place, to which all phenomena, even those of intellectual life, are subordinate; and that it is the duty of mankind to promote the fuller development of culture toward perfection, so that the order of the moral world may be more and more clearly manifested in civilization.

Students in ethics must not forget that all moral views, as are all facts in intellectual action, are subject to a future development so immense that we have no measure for it. However, from its past development we may estimate its future. Ethics teaches how moral individualism—the striving of the individual after moral perfection, and thereby after happiness—can and must be united with moral socialism—that is to say, the striving of mankind toward moral perfection. Ethics is therefore occupied with the ethical ennoblement of man, individually and socially. But as the formation of moral

character—the ennoblement of man in development to a moral personality in the service of society—is the end of education, so ethics defines the direction of education and its attainment.

The purpose of education is to help man and mankind as a whole in developing toward perfection, formally and materially. The starting point, course, and end of formal perfection are made known to us by the science of man, particularly physiology and psychology. The means, ways, and ends of material perfection in physical, mental, and moral regard are defined by dietetics, logic, and ethics. Consequently, they have always been, and ever will be, the fundamental sciences upon which pedagogy, the science of education, rests.

General pedagogy must follow the course defined by these fundamental sciences, and show how, in accordance with the given laws for the development of intellectual life and moral culture, the end of education is to be attained in the shortest and best natural and scientific way, and with the simplest and best natural and scientific means. For education in the pedagogical sense is the designed and regular influence of the educator on the development of the child, so that it may most surely attain its end on the shortest and best road, with the simplest and best means. Everything which does not meet these demands is excluded from the science of pedagogy.

Pedagogy must be primarily occupied with the object of education, i. e., the child and its development. In order to recognize the lawful course of this development and to what end natural growth tends—for natural growth is ever unchangeable, unaffected by changes of time or culture—it must investigate how this end is more minutely defined by the culture, science, and art of the times, for education must enable the child to elevate himself in the shortest and best way conformable to natural development, from the low stage of mentality in which he is born to the highest state of culture that up to this time has been attained by mankind, and especially by his own nation, and to take a successful part in the development of human culture in the sense of moral perfection.

Finally, general pedagogy must investigate the means and ways and frame applicable rules by means of which the child can attain the proposed end according to the established laws of development. It must, consequently, determine the means and ways by which the pupil acquires a sensible and intelligent view of life and the world, and becomes capacitated for intelligent action. It must find the ways and means by which the development of the individual is so directed that he understands his natural and historical surroundings and is enabled to assert himself in them.

This is the general education which everyone must possess without regard to his vocation, and general pedagogy must keep this in view. This educational aim culminates in the ideal aim of a moral personality—a moral character. It is the same for all time. General pedagogy of the present day need only see to it that the end and the ways thereto, in progressive science, particularly anthropology, logic, and ethics, be more clearly recognized, and that the natural and scientific means for the attainment of this end be chosen with regard to the progress of education and science.

If the educational aims of the time do not conform to the rules established by general pedagogy, if they be not natural nor in touch with the culture prevailing, a change of educational aims is necessary, in the sense that the forming of reasonable views of the world and a moral view of life is aimed at, by means of which the child is enabled

to develop into a moral personality which can successfully take part in the further development of education in the growth toward moral perfection. From this standpoint the selection of educational means and aims separately, their mutual relation and their reciprocal action (concentration), as well as the methods, must be kept in view, in order, if necessary, to exact a transformation according to the demands of the conditions of education and life of the times.

An education which meets these demands also prepares for practical life, for it enables the pupil to participate successfully in the educational work of the present. It places him on a high stage of adaptability, so that under all vicissitudes of fortune he can assert his position in life and become a useful member of society. The particular preparation for a distinct vocation with which special pedagogy is occupied is easily associated with it.

Special pedagogy shows how the rules laid down by general pedagogy apply to particular cases, i. e., to certain school conditions and branches of study, and how they must accordingly be supplemented and expanded. While general pedagogy has a more theoretical character, special pedagogy is more practical, without losing the scientific character and becoming absolutely practical, since it is the consequent construction of general pedagogy with regard to special conditions. The development of general pedagogy, therefore, aids the development and construction of special pedagogy, which is always under the influence of the education of the time.

Test all, keep the good, and if anything better has matured within you, add it to this good, is the task set before *scientific pedagogy*, in connection with the study of pedagogy in its development within the social culture and intellectual life of the times, and from the standpoint of science, art, and philosophy. It is to be critical in its view of the pedagogy of the past, and systematically constructive in reference to the pedagogy of the present. This forms the conclusion of the history of educational development, and contains the directions to be followed by the pedagogy of the future. Many a stone toward the erection of this systematic pedagogy, i. e., for a theory of scientific pedagogy, has been laid. A systematic adjustment to a relatively finished system is still lacking. In separate divisions attempts have been made to mold different studies, especially those of natural philosophy, according to modern points of view; but on the whole the systematic pedagogy of our time is of the past.

Every educational system grows historically from the general status of science and the views of the world and life of a people and its age, consequently there is no system of education generally applicable to all ages. Be the system religious or philosophical; be it the system of a Pestalozzi, Harnisch, or Diesterweg, of a Herbart or Beneke, of a Ziller or Dittes, it is never applicable to all nor to successive ages. Scientific pedagogy of our time, which should direct the course of education and culture for youth in the present and future, must be rooted in the culture of science and philosophy, in the views of life and the world of our time, and derive its rules from them; and it must preserve the good that has been acquired by critical tests of the systems of the past, exclude what no longer meets the present demands of science and the prevailing views, and add the better, which has been found by experience and reflection, under the influence of the progress of social culture and intellectual life—add it in the spirit of truth and love.

A different task is set before practical educators: they must calculate with the given factors and endeavor to turn existing conditions that have a historic foundation gradually into the courses of a natural and scientific development conformable with the demands of scientific pedagogy. They must, therefore, consider even such conditions and factors as are no longer justified by the demands of present scientific pedagogy, but which they have not the power to set aside. They must give directions which, presupposing the pedagogical tact acquired by experience, reflection, and practice, can be directly applied. Because of their direct use to him, practical pedagogy is the chief study for the teacher. But he can never lose the connection with scientific pedagogy without descending to the plane of a mechanic and jeopardizing the necessary and beneficial reciprocal action between theory and practice in the development of pedagogy.

From the points of view proposed let us examine more closely the most important pedagogical writings of the year 1895.

I. *Pedagogy as a whole, in its historical development.*—Recent prominent articles in educational journals and the subjects discussed in 1896 by the National German Teachers' Association (for instance, "The transformation of educational aims according to present demands"), show plainly wherein scientific pedagogy is deficient, i. e., in knowledge of the history of educational development from ancient times to the present in its connection with social culture and intellectual life. If such a literary treasure had been available to elementary school-teachers and its contents had been thoroughly studied by them, they would surely have known that the paramount question should not be put in the form in which it is presented. There can be no question of a "transformation of educational aims." To effect such a change we must be familiar with the development of education in close connection with the social culture and intellectual life of the times and know what relation educational aims, as they are defined in our present school system, bear to the civilization of the times in which they were proposed, and whether they still meet the demands of present culture. If this can not be affirmed, we must investigate further and see what claims are made by the present social culture and intellectual life and how the educational aims of elementary schools must be changed so that they may meet present demands. As these conditions have not been fulfilled, none of the discussions on this subject have had any satisfactory result. In consequence, the executive committee of the National Teachers' Association has changed the wording of the theme, restricting the general question to particulars: "What studies are to be introduced into the curriculum of present elementary schools?" The difficulties in the way of a general answer to this question have thus been only apparently removed, and a treatment of the subject, based upon principles and from the standpoint of scientific pedagogy, has been renounced. There is no other course left now than to answer the question from the standpoint of practical life and the experience of individual teachers. That the answer given will not be the right one, because the firm points of view based on principles are wanting, needs no further argument. The question will be differently answered according to the understanding of the demands of practical life and experience of the individual.

The first question which confronts the educator is the aim of his occupation. To be able to answer this, and answer it in such way as to oppose all contradiction, it does not suffice to rely upon daily experience, or the opinions either of

those by whom we are surrounded or a larger public. Counsel must be sought elsewhere, namely, in science. First in order is the history of education. The study of it is of greatest importance, in fact, indispensable. It must form the foundation and the starting point of all the theoretical schooling of the artist-educator. (Dr. Bergemann, The Foundations of Truly Scientific Pedagogy.)

Anthropologic-ethical pedagogy of itself, that is, without connection with the social culture and intellectual life of the times, proposes a purely formal aim to education (moral personality, etc.). The more immediate purpose which directs general educational aims in their separate parts, and thus defines that which leads to the attainment of the end mentioned in the foregoing discussion (moral, intellectual, physical, and economical education), pedagogy derives from the social culture and intellectual life of the times. From this standpoint, then, the means that serve for the attainment of this end, consequently, the studies of the lower schools, must be selected.

Whoever watches attentively the currents of social culture and the intellect of our times, understands that we are living in an age of great agitation, similar to the transition period from the Middle Ages to modern times, in which scholasticism struggled with free science and its outcome, free philosophy. We are undoubtedly approaching a new era of social culture and civilization, for which the foundations have been laid since the middle of this century, and of the development of which the century to come must take care. New civilization, upon the foundation of modern science, however, requires a new pedagogy; new not in the sense that anything old or rooted in the past must be cast aside and a totally new construction framed, but new in the sense that what has stood the test and still meets present demands of social culture and intellectual life, themselves outgrowths of the past, be preserved and supplemented, expanded and intensified conformably to educational and intellectual progress. In substance, scientific and practical pedagogy of our times rests upon the past. Occasionally we notice a few innovations, often without any well-founded relation to the whole, which attempt to justify the claims of present life. In last year's report (Richter's Pädagogischer Jahresbericht, 1894) we discussed different attempts to frame a new structure according to the demands of the social culture and intellectual life of our times. As we then demonstrated, biased views were followed, isolated as they were from the development of pedagogy, and, therefore, not founded on the firm substructure of a history of educational growth. This must first be established before we can set the capstone in the erection of a new structure.

We exact nothing new in this respect. Karl Schmidt has, in four comprehensive volumes, already given us a "History of Pedagogy, treated in historical development and in organic connection with the intellectual life of nations." Independent of the mistakes and deficiencies that must attach to so comprehensive a work, which treats of the development of all educational efforts in their arrangement and various applications, uniformly and from every point of view, there is the further fault that in 1890 only the first volume appeared, revised with the aid of later investigations and discoveries. It is, however, the last of the four volumes, treating of the present time, from Pestalozzi to Dittes, which must be thoroughly revised to meet the present requirements of a history of education. The first volume of the work in its new edition, owing to its extensive plan, has attained such a dimension that it has found few purchasers among teachers. That may be the reason why the revision of the following volumes has not

A different task is set before practical educators: they must calculate with the given factors and endeavor to turn existing conditions that have a historic foundation gradually into the courses of a natural and scientific development conformable with the demands of scientific pedagogy. They must, therefore, consider even such conditions and factors as are no longer justified by the demands of present scientific pedagogy, but which they have not the power to set aside. They must give directions which, presupposing the pedagogical tact acquired by experience, reflection, and practice, can be directly applied. Because of their direct use to him, practical pedagogy is the chief study for the teacher. But he can never lose the connection with scientific pedagogy without descending to the plane of a mechanic and jeopardizing the necessary and beneficial reciprocal action between theory and practice in the development of pedagogy.

From the points of view proposed let us examine more closely the most important pedagogical writings of the year 1895.

I. *Pedagogy as a whole, in its historical development.*—Recent prominent articles in educational journals and the subjects discussed in 1896 by the National German Teachers' Association (for instance, "The transformation of educational aims according to present demands"), show plainly wherein scientific pedagogy is deficient, i. e., in knowledge of the history of educational development from ancient times to the present in its connection with social culture and intellectual life. If such a literary treasure had been available to elementary school-teachers and its contents had been thoroughly studied by them, they would surely have known that the paramount question should not be put in the form in which it is presented. There can be no question of a "transformation of educational aims." To effect such a change we must be familiar with the development of education in close connection with the social culture and intellectual life of the times and know what relation educational aims, as they are defined in our present school system, bear to the civilization of the times in which they were proposed, and whether they still meet the demands of present culture. If this can not be affirmed, we must investigate further and see what claims are made by the present social culture and intellectual life and how the educational aims of elementary schools must be changed so that they may meet present demands. As these conditions have not been fulfilled, none of the discussions on this subject have had any satisfactory result. In consequence, the executive committee of the National Teachers' Association has changed the wording of the theme, restricting the general question to particulars: "What studies are to be introduced into the curriculum of present elementary schools?" The difficulties in the way of a general answer to this question have thus been only apparently removed, and a treatment of the subject, based upon principles and from the standpoint of scientific pedagogy, has been renounced. There is no other course left now than to answer the question from the standpoint of practical life and the experience of individual teachers. That the answer given will not be the right one, because the firm points of view based on principles are wanting, needs no further argument. The question will be differently answered according to the understanding of the demands of practical life and experience of the individual.

The first question which confronts the educator is the aim of his occupation. To be able to answer this, and answer it in such way as to oppose all contradiction, it does not suffice to rely upon daily experience, or the opinions either of

those by whom we are surrounded or a larger public. Counsel must be sought elsewhere, namely, in science. First in order is the history of education. The study of it is of greatest importance, in fact, indispensable. It must form the foundation and the starting point of all the theoretical schooling of the artist-educator. (Dr. Bergemann, The Foundations of Truly Scientific Pedagogy.)

Anthropologic-ethical pedagogy of itself, that is, without connection with the social culture and intellectual life of the times, proposes a purely formal aim to education (moral personality, etc.). The more immediate purpose which directs general educational aims in their separate parts, and thus defines that which leads to the attainment of the end mentioned in the foregoing discussion (moral, intellectual, physical, and economical education), pedagogy derives from the social culture and intellectual life of the times. From this standpoint, then, the means that serve for the attainment of this end, consequently, the studies of the lower schools, must be selected.

Whoever watches attentively the currents of social culture and the intellect of our times, understands that we are living in an age of great agitation, similar to the transition period from the Middle Ages to modern times, in which scholasticism struggled with free science and its outcome, free philosophy. We are undoubtedly approaching a new era of social culture and civilization, for which the foundations have been laid since the middle of this century, and of the development of which the century to come must take care. New civilization, upon the foundation of modern science, however, requires a new pedagogy; new not in the sense that anything old or rooted in the past must be cast aside and a totally new construction framed, but new in the sense that what has stood the test and still meets present demands of social culture and intellectual life, themselves outgrowths of the past, be preserved and supplemented, expanded and intensified conformably to educational and intellectual progress. In substance, scientific and practical pedagogy of our times rests upon the past. Occasionally we notice a few innovations, often without any well-founded relation to the whole, which attempt to justify the claims of present life. In last year's report (Richter's Pädagogischer Jahresbericht, 1894) we discussed different attempts to frame a new structure according to the demands of the social culture and intellectual life of our times. As we then demonstrated, biased views were followed, isolated as they were from the development of pedagogy, and, therefore, not founded on the firm substructure of a history of educational growth. This must first be established before we can set the capstone in the erection of a new structure.

We exact nothing new in this respect. Karl Schmidt has, in four comprehensive volumes, already given us a "History of Pedagogy, treated in historical development and in organic connection with the intellectual life of nations." Independent of the mistakes and deficiencies that must attach to so comprehensive a work, which treats of the development of all educational efforts in their arrangement and various applications, uniformly and from every point of view, there is the further fault that in 1890 only the first volume appeared, revised with the aid of later investigations and discoveries. It is, however, the last of the four volumes, treating of the present time, from Pestalozzi to Dittes, which must be thoroughly revised to meet the present requirements of a history of education. The first volume of the work in its new edition, owing to its extensive plan, has attained such a dimension that it has found few purchasers among teachers. That may be the reason why the revision of the following volumes has not

yet been undertaken, and is not anticipated. The development of pedagogy before Pestalozzi is not so important to the teacher, for, in fact, actual pedagogy for elementary public schools exists only since Pestalozzi, since a knowledge of the science and art is not altogether indispensable, as the pedagogy of Pestalozzi is rooted in the time before Pestalozzi. A history of pedagogical development for teachers must comprehensively treat of the times before Pestalozzi, and lay special stress upon the facts which are important and valuable for the public-school education. (Karl Schmidt devotes three large volumes to these.) The time since Pestalozzi requires a thorough treatment, so that the teacher may obtain a clear insight into the pedagogy for elementary public schools, and can distinctly recognize the claims of the present on the educational aims of schools designed for the masses.

The writer has for years labored at such a work (Guide to the Further Education of Teachers), and its outlines have been finished. These outlines, like other similar books, may suffice for those teachers who confine themselves to the first and most important occupation of their profession, teaching and training, and take only a limited part in pedagogical advancement. For all other public-school teachers, and particularly for teachers in normal schools, a cursory presentation of the subject does not suffice, especially if they wish to participate actively in the development of scientific and practical pedagogy for public schools. In "The pedagogy of Pestalozzi in its development, construction, and completion, and according to its influence upon the formation of school systems," the writer has endeavored to give a comprehensive treatise on the period of the birth of pedagogy for common schools, according to the quoted points of view. He intends to present in the same way in a volume of the same compass the development before, and in two more volumes the development after Pestalozzi, so that the last volume will be a treatise on the currents of pedagogy and its fundamental and auxiliary sciences in connection with the civilization of our times.

The past year (1895) was not wanting in contributions and original references for such a work, both as regards the fundamental sciences and actual pedagogy. The more and the more thoroughly we investigate and labor in this respect, namely, the more old school records and other official documents are utilized in the preparation of articles on the development of school systems of separate cities and States, the more reliable will be the presentation of the whole in which the essential facts are united. Most of the smaller works on the history of education are conglomerations of all kinds of facts, some worth knowing, others worthless, but not a single work on history of educational development in the sense in which we are to apply the term. Still, they meet the requirements of the customary instruction in normal schools of to-day; and for purposes of fitting students for professional examinations they do well enough.

II. *The fundamental sciences of pedagogy* have been essentially enriched during the past year. We note valuable new works on the history of philosophy and on the results of late investigations in psychology and logic, and authoritative works on ethics. Greater efforts are constantly being made to render the results of scientific investigation accessible to the unlearned in a form that is easily understood. The authors are careful to separate the positive facts from mere hypotheses and theories not yet sufficiently tried. The examination of problems in psychology and ethics is discussed, and their solution attempted from present standpoints of these sciences. The efforts

in both directions are beneficial for pedagogy. On the one hand, teachers are enabled to acquaint themselves with the results of scientific investigation without the difficult and absorbing study of more comprehensive works; and, on the other hand, they can occupy themselves with purely pedagogic questions, such as attention, distraction, and others of great importance to educational practice. Since Pestalozzi, all leading teachers have emphasized the fact that a successful education is possible only with a correct knowledge of man in his physical and intellectual character. Of course, we can not rest with this knowledge alone. The child must be studied from the acquired points of view, and the established psychological laws applied to the solution of special educational tasks. Even if we have no books which treat of psychology, logic, and ethics in the form above defined with respect to pedagogy, according to the present status of these sciences, the way has been opened for the publication of such works in the course of time.

III. *General pedagogy* has been enriched this year by several valuable monographs (on interest, concentration), but there are no comprehensive treatises on the basis of later psychology, logic, and ethics. Reforms, deserving of increased attention, are being prepared in general didactics, as we learn from several pamphlets at hand. The impulse has been given by ethics on the one hand and by special sciences on the other, and has already exerted a strong influence on the different branches of study of special methodology.

IV. *In special pedagogy* we can only note monographs, few of which, however, deserve to be classed among the literature of special pedagogy. They refer mostly to subjects of methodology. They treat mainly of the valuation of matters submitted by special sciences for moral and economic training (in lessons on religion, in natural study, and other branches). In all branches of instruction there are noticed strenuous efforts to establish the causal connection between the various departments of science, to place things and phenomena according to the natural connection in which they actually exist, and to sift and supplement the subject-matter conformably to the results of the scientific investigation of the times and its value for religiously moral, intellectual, and economic education.

If we compare with open eyes the demands of the times and of science with those of scientific and practical pedagogy, we are convinced that scientific pedagogy must consider more than heretofore the demands of the times and of science, and that special pedagogy must pay greater attention to the demands of general pedagogy. The teachers of public schools must fully understand this fact. Beyond question the public schools of to-day give better results than those of fifty years ago, but their progress has not kept pace with the immense changes in public life and the necessities occasioned thereby. The selection, arrangement, and treatment of studies must be repeatedly subjected to a minute investigation from the standpoint of natural and scientific pedagogy. Should the result be a transformation of official—i. e., practically applied—pedagogy in respect to well-defined educational aims, scientific pedagogy must endeavor to have these demands recognized and met with in practice. This is entirely in accordance with both nature and culture, for progress everywhere means the normal condition—health. A standing still is an abnormal condition—disease; and diseases in social bodies lead to revolutions.

A harmonious development of man in body and soul into a noble

human character, in whom the sensual is subordinate to the intellectual and the intellectual to the moral, is to-day, as it was in Pestalozzi's time, the highest formal aim of the education of the individual. But the claims of social pedagogy—i. e., to understand the individual as a member of his race, and particularly as a member of his nation, and develop him into a moral personality, capable of successfully taking part in the educational work of his time in the sense of educational progress—are more prominent than ever. In this sense our times demand an increase in valuable matters of formal education of the individual, in view of the fact that every member of the State should attain the highest possible grade of physical, mental, and moral development, so that under all vicissitudes he can assert an independent position in life, understand his existence in a world of reality, be a useful member of society as a strong, moral individual, and firm, independent personality, and can intelligently take part in social progress toward perfection.

Above all things, then, our times require a harmonious, natural, and scientific perfecting of physical, mental, moral, and economic development of the individual, especially in his mutual relations with others. They require the body to be strengthened, the intellect trained, and the will disciplined. It is therefore necessary to give closer attention to the care of juvenile and national games, to manual training, and to reforms in nature study, historical and ethical instruction, and to the introduction of the studies of civics and national and domestic economy. All these branches must be examined, and the dividing line sharply drawn between what belongs to the general education of every pupil in the common schools and what to a special education, and confined to supplementary schools. A thorough sifting of matter in regard to these studies must take place, so that all matter foreign to moral, social, and economic education may be rejected. Close attention must be given to removing all useless ballast from the curriculum of the schools, and to making the studies correspond to the present demands of science and the view of the world and life founded on it. In the acquiring of a harmonious and reasonable view of the world and life lies moral self-dependence for the individual or the nation, which guarantees the development of mankind in the sense of moral perfection. This self-dependence results from a clear understanding of natural and civilized life, and from an emotional and intelligent comprehension of moral and religious truths and their connection with the natural laws of life. Successful participation in the social life of communities and the State requires a clear knowledge of the history of the development, the conditions of existence, and the construction of these social organisms, as well as the ability to recognize and respect the rights and duties owing to them. The individual must therefore learn the history, the conditions of life, and the constitution of his nation and his State, must convince himself that he can only find his construction of life and earthly destiny in the social whole, and must arrive at an earnest determination to participate successfully in the civilizing work of his time and his nation.

Finally, the individual can only participate in the economic work of the civilization of his times if he penetrates the laws of nature in so far as they affect his sphere of action, and reviews the economic organic connection of personal work with the general civilizing work of his nation. He can take an active part only if he can master and apply these laws, and is willing to enter their service. However, a

proper arrangement of the curriculum must establish such uniformity among the separate studies that they give reciprocal support, and make possible the formation of a uniform sphere of thought, the separate parts of which are most intimately joined.

Of course, the treatment of the studies must follow the laws of pedagogic methods, which receive their direction from psychology and logic. Discipline, in obedience to ethical laws, must support the education of the intellect and assist in bringing the formation of ethical character nearer to perfection. It must associate with the view of the world and of life, acquired by means of the education of the intellect, and mold the energy produced by ethical ideas based on this foundation into a fixed purpose of the will which no obstacle can turn aside from making these ideas rule in any one life or in the social organism of a nation.

SPECIAL SCHOOLS OR SEPARATE CLASSES FOR CHILDREN OF LIMITED MENTAL CAPACITY.

In November, 1892, the minister of public education in Berlin published an order referring to the fact that in several cities of the Kingdom of Prussia the local school authorities had arranged for separating from the majority of pupils children intellectually slow and dull, but otherwise normal, and by no means to be confounded with idiots, by establishing either special schools for them or separate classes in large schoolhouses. He particularly emphasized the consideration that the pupils to be selected for this special instruction should not be idiots—that is, children entirely helpless and only fit to be placed in asylums—for such individuals had no place in a public school; but he intimated that children should be selected who are a "dead weight" in school, and fail to be promoted because they can not keep pace with average pupils. Such children might be benefited by methods specially adapted to their weakness, and the course of study might be altered and curtailed to suit their capacity.

He furthermore insisted that every pupil assigned to these special schools or separate classes must be subjected to a careful physical examination by a physician to determine whether their intellectual weakness be not the result of defective senses, or other causes that may be removed. He closed his order by calling for a report of every school inspector in whose district such an establishment exists.

The result of this inquiry in March, 1893, was published in tabulated form in June, 1894. The minister prefaced this brief table by saying that such institutions were in existence in eighteen cities of the Kingdom. While in previous years the special classes had been partly filled with children morally unsafe, these had lately been withdrawn, and now only children of dull intellect were thus treated separately. These were pupils who, during an attendance of two or three years in graded schools, had given evidence that they could be taught, but were unable to keep pace with normally endowed children.

Experience, he stated, had proved that such children could be found everywhere, and that both the poorly and the normally endowed were benefited by a separation. The authorities of several cities reported that these intellectually weak children were normal enough to educate to be useful members of society, if their training were carefully adapted to their needs. The minister repeated his injunction, that no child be assigned to such a school, or special class, unless a physician had given his consent, and stated that the retarded intellect was caused by constitutional defects, or was an after effect of disease, and hence could not be accelerated by the usual school influences, but needed special treatment. The minister expressed his approval of the efforts of teachers in behalf of child-study, especially in gathering data concerning the history of mental development in weak-minded children. The consent of the physician, he remarked, was most desirable, inasmuch as such authoritative action would be a safeguard against assigning to these separate classes any children who are normally or excessively endowed by nature.

The opinions called for had proved unaminously favorable, and in many cities both school and city authorities followed the enterprise with sympathy and deep interest. In consequence of the decided success of the older institutions of this kind, other local authorities had been induced to grant the required appropriations, so that the number of pupils could be restricted to 25 in any one of these separate classes or schools. He gathered from the reports sent him that specially talented and skillful teachers had been employed, and that their salaries ranged considerably higher than the average. The name given to these separate classes in Prussia is "Hilfsklassen für schwachbegabte Kinder" (supplementary classes for weakly endowed children).

In these special classes no lesson or exercise is allowed to exceed thirty minutes, and the amount to be learned in a year's course is not as great as in ordinary schools. The result, the minister thinks, might be considered quite satisfactory if the children, when ready to be dismissed at 14 years of age, have reached the degree of proficiency usually attained by children of 11 or 12 years. A number of carefully itemized courses of study submitted to the minister (but not published) are approved as exhibiting a laudable consideration of the particular aims of such institutions, with regard to both the amount and the selection of matter to be taught. Subjects, for instance, which require exceptional mental effort are set aside in favor of others better adapted to develop physical energy and practical skill. Outside of Berlin all the separate classes for intellectually dull children are maintained by municipal government, while in Berlin such children are placed under private care.

TABLE I.—*Institutions for intellectually weak children of school age in Prussia, 1892.*

Name of city.	Number of—				Is physician's certificate required?	Teachers.	Remarks.

a Approximately.

On the 28th of August, 1896, the minister of education published a second report, which revealed the facts that from the 18 cities which in 1894 had provided for separate classes for dull children there had been an increase to 27, and in the number of pupils from 700 to 2,017. He expresses his satisfaction that the unexpected success of these institutions has resulted in removing obstacles arising from the opposition of parents against a separation of their children from the majority. He assures the local authorities that he will continue to watch with sympathy their efforts in behalf of these separate schools or classes, and will aid them as far as possible. The following is the result of the last statistical inquiry, dated January 13, 1896.

TABLE II.—*Statistics of educational institutions for intellectually weak children of school age in Prussia, January, 1896.*

d With supplementary grade for advanced pupils.
e Average.
f In some cases.
g Private care.

Remarks.—Königsberg reports that the pupils of 14 years, who are dismissed from the special classes, have all been able to earn a living. Charlottenburg and other cities report that nearly one-half of the time devoted to the mentally slow pupils is spent in giving manual training. Occasional reports state that about 40 per cent of these dull children are girls, and that in every case where a sufficient number of girls are found they are taught by a woman, chiefly in woman's handiwork. Many of the pupils are found to have defective senses, either of sight or hearing, and that when the defects are cured, they are all able to take up the work of the regular school and are sent there. There are occasional cases of children who prove entirely unable to learn arithmetic, reading, or writing. These are chiefly taught manual dexterity. In some cities, notably in Dortmund, Westphalia, the percentage of mentally slow pupils, fit only for separate classes, has been found to be two to three in a thousand. Naturally they are found in centers of population oftener than in the country.

In connection with the foregoing governmental report it is instructive to present a feature of the schools of Berlin which sheds light on the necessity of caring for children who do not quite come up to the average in intellectual attainments. The report of the Berlin school board of 1895 contains these statements:

Of all the pupils in the first or primer classes in the city there were 4 boys and 1 girl aged 14 years, 2 boys and 5 girls aged 13, 12 boys and 10 girls aged 12, 37 boys and 31 girls aged 11, 95 boys and 89 girls aged 10, 428 boys and 320 girls aged 9, who should be treated like those considered as being but 6 years old, or at most 7.

Of all the pupils in the second grade in the city there were 11 boys and 1 girl aged 14 years, 50 boys and 44 girls aged 13, 135 boys and 150 girls aged 12, 421 boys and 370 girls aged 11, 1,040 boys and 1,048 girls aged 10, who should be treated like those considered as being but 7, or at most 8 years old.

Of all the pupils in the third grade in the city there were 3 boys and 1 girl over 14 years, 56 boys and 48 girls aged 14, 389 boys and 438 girls aged 13, 896 boys and 1,006 girls aged 12, 1,804 boys and 2,031 girls aged 11, whose average age should be considered as being but 9 or 10 years.

Of all the pupils in the fourth grade in the city there were 2 boys over 14 years, 214 boys and 236 girls aged 14 years, 1,392 boys and 1,457 girls aged 13, 2,346 boys and 2,710 girls aged 12, while the average age of normally endowed children of this grade is between 10 and 11 years.

Of course the figures are to some extent explained by the enormous influx of population during the last twenty years, a period during which Berlin grew faster even than Chicago. They are also explained by the rapid shifting of the population which followed the demands of the labor market and the ever-shifting conditions in industry.

But it is reasonable to suppose that among the great number of pupils reported as above the average age there are many who might be benefited by special care in separate classes.

SEPARATE SCHOOLS IN THE UNITED STATES.

The idea of establishing separate classes or schools for pupils of limited natural endowment was first presented to American teachers by Prof. August Schneck, of Detroit, in a paper read before the German-American Teachers' Association in 1878. It was taken up by Dr. Andrew J. Rickoff, superintendent of schools in Cleveland, Ohio. He established two such schools, but chiefly for morally unsound children—that is, boys and girls who had proved unsafe companions for others. Superintendent Frank Hall, of Waukegan, Ill., recently followed this example and established such a school in his town.[1] It is not to be, in any sense, a limbo for the reception of mental and moral cripples, but will have careful plans of work, and will be just as "respectable" as any other school, as will be seen from the following announcement of Mr. Hall:

Into this room pupils will be admitted from the following classes:

1. Those who have not been in school for several years, and who now desire to avail themselves of school privileges, but do not seem to class well in any of the regular departments.

2. Those who have completed the eighth-grade work, and for good and sufficient reasons do not desire to take the regular work of the high school, but who are anxious to become more proficient in the so-called common school branches.

3. All pupils over 14 years of age and less than 21, whose education, in the judgment of the superintendent, can be better provided for in this department than in any other department of the school.

The practical side of school work will receive especial emphasis. The arithmetic of the farm, of the workshop, and of the store will be made prominent. We can not, with our limited facilities, compete with the commercial schools, but elementary bookkeeping will be taught, and the pupils will have frequent exercise in writing letters, receipts, duebills, notes, etc.

In a small way we hope to introduce work in manual training—enough of this, at least, to assist the pupil in relating his school work to any legitimate manual occupation in which he may expect to engage. "That form of mind training called manual training" is desirable for all, but it is absolutely essential as a means of creating and maintaining interest on the part of those pupils who do not expect to become merchants or to engage in the learned professions. While we shall emphasize the so-called practical studies in this department, we shall, in addition to this, spare no pains to interest the pupils in good reading; to create a love for good books; to train them in thinking and in the expression of thought, and, in a word, to open to them some of the avenues that lead to higher intellectual culture and to the pleasures of the spirit. In all this we shall not lose sight of the fact that the aim of education is good character, and that good character implies useful occupation.

Much that we shall attempt is, in some respects, experimental and tentative. All we can ask of any who may doubt the expediency of such a movement is that

[1] Previous to this service at Waukegan, Mr. Hall was principal of the State Institution for the Blind, a position which he has resumed.

they grant us the boon of what some one has called the greatest discovery of the nineteenth century—suspended judgment.

Though Mr. Hall will evidently pay particular attention to pupils of retarded development, he is benefiting his town by the establishment of a school resembling the German continuation or supplementary schools.[1]

A valuable contribution to the discussion on separate schools for intellectually weak children is found in the proceedings of Philadelphia Educational Club during its session on the 11th of January, 1897. The report of this session is contained in The Teacher, published in Philadelphia. Permission to reprint the article has been secured from the editor. As has been said before, American teachers do not restrict themselves to advocating separate schools for mentally weak children; they advocate also the admission of the morally unsound to these schools. This will be seen from the following discussion of the teachers in Philadelphia:

The subject of the evening was "Special schools for individual children," and the first speaker was Mrs. Rhoda A. Esten, of Providence, R. I., who said in part:

The purpose of the special schools of Providence is to provide suitable instruction and discipline for pupils for whom our present graded system of schools is not well adapted. The immediate occasion for the establishment of these schools was the abolition of corporal punishment in some grades and its very great restriction in others, combined with a strict enforcement of the "truant law." The change in the mode of enforcing discipline in our regular schools caused the teachers great trouble at first. Discipline became more difficult and some means of restraining those who seemed not to be amenable to reason were needed. At first the remedy against insubordination was suspension and sending home to parents. We found, as others have found, that the frequent and wholesale sending pupils home for misconduct brings the school into disrepute and the teacher into contempt. The parent becomes exasperated and denounces the teacher in the presence of the child or punishes the child with too great severity. The strict enforcement of the truant law compelled the pupils, turned loose upon the street, to return to school, thus causing the attendance of a class of children who never relish the confinement of the school—the truants and children of the street.

Provision for chronic truants.—The committee recognized that some provision must be made for these pupils, and met the issue by establishing special schools whose work in part was to provide for this class. Six of these schools were established during the school year 1893-94 and one in October, 1894. The schools were organized as annexes of our grammar schools, but were opened in detached buildings. Five occupy evening schoolrooms, one a ward room, one a hired chapel, one an unused room in a primary school building. Of the pupils provided for in these schools, perhaps the most deserving are those who, by reason of poverty or lack of means, can attend school only eighty days of the year, and, in consequence of this loss of time in school, fail to keep up with their grade work.

The boy who gets behind his fellows and has grown old in years and become maturer in powers, but deficient in his acquisitions, can not be well provided for in our graded schools. He enters school after a year's absence, perhaps, and is classed with pupils younger and smaller than himself. This is galling to his pride. If he be a boy of good ability, to whom opportunity has been lacking, he

[1] See articles on this subject in Annual Reports of 1893-94 and 1894-95, under the title, "Education in Central Europe."

can do much more than his classmates, but has no opportunity to go faster. If he be dull, staying at home has not increased his power of acquisition, though some development has come with years. In a manufacturing city like Providence the number of pupils of this class is large.

Our superintendent and committee recognized the needs of this class early in the school year 1887-88 and urged the necessity of establishing ungraded schools with a course of study adapted to meet the needs of this class, who can only go to school for a few years. The committee concurred with the superintendent, but the council failed to act. These pupils are now provided for by our special schools.

Other classes of children benefited.—There are other pupils who, from absence and lack of self-control, fail to do well and become a disturbing element in the regular schools, requiring so much of the teacher's time to manage as to prevent her from doing justice to the large number of regular, obedient, and studious children under her charge. In these schools, under teachers strong in self-control, patient and tactful in management, these pupils are brought to a state of obedience and self-respect. Pupils who for some cause are disaffected and out of harmony with their surroundings are much benefited by a short sojourn in these schools. Intelligent foreigners, who desire to obtain a knowledge of the English language and are too old to enter the grade in which their present acquisitions would place them, also become pupils in these schools. Perhaps the most difficult and least meritorious, and yet most needful of the pupils provided for in these schools, are the children forced into school—the unfortunate neglected ones who, from lack of sympathy or control at home, have become indifferent, unruly, and unwilling to attend school. With no disposition to work, it is impossible for these to take up the regular work of our graded schools, yet these pupils are compelled by law to attend school. These schools give to these pupils an opportunity to become educated, respectable citizens. There is no class of pupils that it will pay any State or city better to discipline and educate than this. In many instances these pupils have become industrious, ambitious, orderly, and respectful.

The selection of teachers.—Great care, wisdom, and judgment were exercised on the part of the superintendent in the selection of teachers for these schools. Strong-willed, self-reliant, self-possessed, cultured, kind, and sympathetic women are essential. Such teachers were selected from among the best in our schools. They rank as eighth grade teachers and receive a salary of $675 per annum. It ought to be $1,000 per annum.

The number of pupils to a teacher in these schools is limited to twenty or twenty-five, although better work is done with twenty. Pupils sent for discipline are required to remain in these schools until, in the judgment of the teacher, they have acquired sufficient self-control and respect for lawful authority to enable them to enter the regular schools with a fair prospect of remaining. Some of these pupils are so peculiar in their dispositions that it is probable they may never go back to the regular schools.

Discipline corrective, not punitive.—As the aim of these schools is mainly the character building, the discipline is corrective, not punitive. Great pains are taken by the teachers to implant in the minds of these pupils a just conception of their duties to themselves and to those around them and a respect for lawful authority, thus including in the school training the training of the home in a marked degree. The teachers of these special schools receive these pupils kindly and show a personal interest in learning their attainments and preferences, and in pointing out to them what they can do. The past is ignored and a new start taken. Teachers are allowed to use corporal punishment if they deem it useful in any case. They are not to endure disrespect and impertinence tamely in order to make a reputation for managing bad boys without punishment. At the same time, they are to avoid it if it arouses antagonism, and by all means, so far as possible, to have no altercation with a pupil in the presence of others.

Selection of the pupils.—Pupils who fail in respect for and obedience to the rules of schools and can not be brought to a proper state of control through the means at the command of the teacher are referred first to their parents, who are requested to call and cooperate with the teacher. This throws the responsibility on the parents, and gives them the opportunity to make the pupil obedient. Should the parent fail to appear within twenty-four hours, or appearing, and through lack of power or ability fail to bring the pupil to a proper state of obedience, the latter is then sent to the office of the superintendent. Here he is dealt with in a firm, kind manner. If the pupil responds to his admonitions and expresses the desire to have another trial, unless the offense is a very grave one, he is given the opportunity to return to his school again on trial. If he is again sent to the office, a transfer to the special schools is at once given.

These schools are under the immediate charge of the "supervisor of discipline," who is expected to spend at least one hour a week in each school studying the pupils, noting the interest which they manifest in their work, and their progress—mainly, in two essentials, habit and disposition. These teachers meet weekly with the supervisor and discuss the best means of governing and disciplining their pupils, and of inculcating in them right motives of action, correct habits; also proper respect for lawful authority. These discussions are held at the round table for child study.

Our superintendent, who was mainly instrumental in establishing these schools, and to whose reports I am indebted for many of the facts here presented, gives much thought and time to them, making valuable suggestions to both supervisor and teachers. The schools are also visited once a week by the "truant officer," who inquires into the cases of absence and truancy. He has rendered valuable service to the supervisor in looking up these boys in their homes and impressing the parents with the majesty of law and cooperating fully with the teachers. Two records of each pupil are kept at the office of the superintendent of schools—first, his record in the school from which he came; and second, his record in the special school. Each child as he enters these schools is made an object of study by the teacher. His physical, mental, and moral defects are noted, and a written record is made of the same. Care is taken to note the effect of certain methods of discipline and punishment.

Effect of the special schools.—Our special schools help us to make good schools the rule. They bring relief to the regular schools by freeing them from disturbing influences and relieving the regular teacher from the severer strain of discipline. Thus she is enabled to devote herself the more fully to the needs of the ordinary and more responsive pupils. By their aid we have successfully reclaimed and properly instructed and disciplined many persistently unruly pupils who could not be retained in our ordinary graded schools, with whom the only alternative was suspension, thus throwing upon the street the very class most needing instruction and discipline. These schools are now placed upon a firm basis, and are a potent auxiliary in our school system.

The following statistics will show something of the work of these schools since their organization:

From the organization of these schools to June 30, 1895, was a period varying in the several schools from nearly two years to a year and three months. During this period 372 different pupils were enrolled, and of these only 5 were sent to the Reform School and but 1 expelled.

At the beginning of the school year 1895–96, 92 pupils remained in the disciplinary schools from the previous year. To these, 231 were added, making 323 cases treated; 16, however, were sent to these schools for reasons other than misconduct. Of these 323 pupils, 120 were returned to the regular schools, where 100 maintained themselves in good standing, and 20, having failed to be satisfactory

to the teachers, were returned to the disciplinary schools. Sixty-four left to go to work, 5 went to private and parochial schools, 11 moved from the city, 2 died, 10 were sent to the Reform School, and 30 were reported at home—7 on account of sickness; 23 having attended the required eighty days were assisting their parents. One hundred and one remained members of the special schools at the beginning of the present year.

The table that follows shows the grade of the pupils in these schools for the school year 1895–96:

Grade.	Number.	Grade.	Number.
1 B	4	6 B	50
1 A	3	6 A	21
2 B	5	7 B	21
2 A	13	7 A	17
3 B	14	8 B	13
3 A	25	8 A	10
4 B	20	9 A	1
4 A	40	Ungraded	11
5 B	23		
5 A	33	Total	328

As will be noticed, these pupils were of all grades but one below the high school, but the greater number were of the middle grades, those of the third to the seventh years. One grade, the 6 B, stands out conspicuous from its number. These were the boys just entering the grammar schools and coming into new combinations of pupils and under the control of men. In any community where there are pupils to be instructed in sufficient numbers to permit it they will be classified, and, should the number be large enough to furnish several classes of corresponding advancement, they will be graded. Grading produces both economy and efficiency in instruction. Theoretically, all pupils of a grade are able to do the same work and advance at the same speed; but practically it will be true that great differences of power will be found to exist—differences in mental acuteness, in mental grasp, in industry, ambition, health, steadiness of attendance, home advantages, environment, and other elements affecting progress. So, however well we may grade our pupils, their native differences will cause the distance between the better and the poorer scholars to increase every week. It would be a sin to try to keep a class together for a long time, because it could be done only by straining the weaker and suppressing the stronger. Practically, those below the average set the pace to which all others must conform.

Special classes for bright pupils.—Again, some pupils do well in all subjects but one—usually arithmetic or grammar. To require such a pupil to review the several studies in which he does well for the sake of one or two in which he does poorly is not permitting him to use his time to the greatest profit; but this is nearly a necessity in a graded system. To remedy these difficulties, rooms for individual instruction have been opened in our large grammar schools in which the ambitious and capable pupils who wish to gain a grade are permitted to receive individual instruction, and by the aid of the special teachers accomplish the essential portions of work between the two grades and are promoted to the regular class in a higher grade, while those who have failed in one or two studies have the opportunity of entering, if sufficiently earnest, and devote special effort and extra time to the subject in which the deficiency appeared and so regain lost standing.

The mentally deficient children.—Our latest idea is a special school for a class of pupils that appeal to our sympathies but injure our schools more than they gain good to themselves. These are the mentally deficient children, children of such low powers and aptitude that they gain very little from the ordinary graded

school. They require instruction in small groups, and need to be under the constant oversight of a teacher specially adapted for this work. This school was opened November 30, 1896, and has at present 12 girls and boys, selected from our primary grades, whose ages range from 9 to 15 years. It is hoped by this arrangement to sift out in time the entire class of abnormal children from our regular schools, and by special instruction prepare the more hopeful cases to return to the regular school.

To sum up, the essentials for the success of these schools are:

(1) A limited number of pupils in each school.

(2) Quarters away from regular school building.

(3) Special methods of discipline.

(4) Child study.

(5) The very best teachers, teachers especially apt in teaching, governing, and disciplining children.

Our schools—the regular schools, those for special instruction and discipline, rooms for individual work, special schools for backward or mentally deficient children—illustrate the fact that our public schools are increasing in complexity and adaptation to all classes of pupils.

Relation between health and mental power.—Dr. Harrison Allen, the next speaker, called attention to the fact that, in the throat passage above the palate and back of the nose there is a space which is frequently so obstructed by the presence of a soft, tonsil-like mass as to prevent the normal passage of air from the nostril to the lung from taking place. No child is healthy who habitually breathes through the mouth. The respiratory movements, for the most part, are confined to the walls of the abdomen; hence the chest does not expand, the lower ribs fall together and the tips of the shoulder blades project. Dr. Allen directed attention to the injurious effect the throat mass may exert on mental functions. The physician sees many children who possess the throat growth and yet have normal brains, yet it is certainly as true that, as a rule, each afflicted child is mentally below the average. The temper is uncertain; the memory and power of attention imperfect. Not infrequently these peculiarities are so marked as to prevent the child from holding its own with a companion of its own age, and it is found in school with younger children, or at home under special care. Graver conditions are not to be ignored. Occasionally the child is a mute or a stammerer. The temper may be so excitable as to lead to phases of destructiveness, or the child may be quite intractable. Even epileptic convulsions may ensue. Dr. Allen had no doubt that cases occur in every community of children who are classed as examples of "retarded development," of "juvenile depravity," or of "destructive mania," where the real cause of the distress is not within the brain, but in the roof of the throat passage. He felt, therefore, that the attention of teachers and boards of management should be directed to these facts. Fortunately, the remedy is one easily and safely applied. It is to remove the throat mass by an operation. While not all phases of brain arrest or perversion of mental function are to be connected with the growth, yet an enormous mass of unrelieved distress is to be associated with it.

Dr. Allen was of the opinion that in all plans to educate the young systematic care of the throat passages should form a part, and particularly that every backward or defective child should be the subject of an expert medical examination before it is deprived of the privilege of education to which it is entitled.

Character building in education.—Miss Mary C. Wister followed Dr. Allen and said:

The side of the question to be treated by me is what kind of training is required by children who are unfitted for school life as it exists to-day; particularly the children disqualified by their own incapacity for mental effort, by what is known as incorrigibility, or by extreme poverty. No one would attempt to make students of such children. Some one should attempt to make of them honest, industrious

men and women. A fraction of the appropriation now expended upon the department of charities and correction, if transferred to the establishment of special classes for such cases, would not be needed by that department in the future, and how much better spent!

At present the children of well-ordered homes receive the additional benefit of fine mental training. The child without advantages of any kind gets none. To those unfamiliar with such conditions, the child obliged to obey nothing but the dictates of his own lawless will for twenty-four hours a day, is too unapproachable a problem to be considered. Even at this late day, with all the inventions of the modern mind to prevent all the things which should not be (in this most philanthropic of cities), this child is allowed to roam our streets unmolested, except where private effort has reached him for a few hours a week, or one or two big societies have whisked him off to the country. Occasionally some one, who sends coal or clothes to his mother, remonstrates, and then the child is entered at a primary school, to stay—if it appeals to him at all—until suspended, in the course of which proceeding every one has assured him that he is a remarkably bad boy—a reputation that he not infrequently exemplifies later on. We all know such cases, and, fortunately, many of them by reason of a different environment, for a few hours each day, or the influence of some individual, turn the corner and start along the high road of hard work and self-respect.

Children of the poor.—These children of the very poor do not deserve the hard names often used to describe them. They are not heartless. They are not stupid. They live up to their own standard of what is right, as well as many persons with better reasons for so doing. Their vices are surprisingly few, their surroundings considered. Their virtues, under the circumstances, are many. Yet such children are likely to become a burden upon the State or unprofitable, unsatisfactory citizens at best, unless brought under some powerful influence for good.

You say that these children need education. They do! They are in greater need of something, which—for want of a better name—I shall call civilization. Above everything else, these children lack two qualities most essential to the modern man, without which he is fitted only for a more primitive state of existence than the city of to-day. The qualities I speak of are application and self-control. Without self-control a child can not sit still on a chair. Without application he can not learn the A, B, C. And now we reach the point of how the child—who can not study, work or even play consecutively—may be turned into a law-abiding citizen. Our subject, as we now view him, represents a point of view in which antagonism to everything and everybody is the leading feature. Not knowing how to control or apply himself, he does not enjoy any of the occupations that attract the disciplined minds of his neighbors who go to school, and he is in constant dread of having his freedom curtailed. Therefore, his youth is passed in keeping out of the way of every one, from the policeman up and down. There is one thing to be remembered before condemning this child as a hopeless case, which is, that any child will apply himself to study when he wants to learn. The whole trouble with this particular kind of child is that, while left in an untrained condition, he does not wish to learn. The remedy is simple. Change his point of view. And nothing will be gained by spending a moment upon training of any kind that does not lead to this result.

How the awakening comes.—There are, for example, three ways of treating a child's dirty face. The first, to wash it for him; the second, to compel him to wash it (in the majority of institutions this is done); the third, to make him wish to have his face clean. I do not claim that this is a quick method, but it is the only one that will give a child a clean face for life, and a clean face is followed by a clean character and a clean name more often than is commonly supposed.

Perhaps a room in which a boy is not obliged to do anything is the best place for one who wishes to do nothing to take his first lesson; a place where, as long as he

disturbs no one, no one disturbs him. He has taken the first step in the right direction when he has settled down in a quiet corner to do what thinking he is capable of and to observe for himself that other children are on the alert for teachers to talk or play with them. And, although he can not quite understand why, the other children, who don't want the teachers to let them alone, seem to be having the best of it. The child sits and watches, and must be allowed to sit and watch until the awakening comes, as come it will. Sooner or later he comes forward to join the rest. The days of compulsion are past and he is ready to learn something of his own accord. At this stage, what he learns being altogether a secondary matter, the child is given as wide a choice of simple occupations as possible and character training begins.

Without knowing the reason, the world he faces seems suddenly changed to a world of friends, for everyone is ready to help him in the accomplishment of his new ambition, and his heart is ready to take in the influences for good which are already making themselves felt.

Training in self-control.—People seldom realize how easily the untrained mind, when turned in any direction, may be guided and controlled while being taught to guide and control itself, and to do this is the mission of the teacher. There are a multitude of things for the child in question to learn. Manners come first. Not to wear hats indoors; not to roll on the floor during a lesson; not to throw things at his teacher, and many demonstrations of a like nature which would make him an unwelcome addition to the well-managed schoolroom. Next come the principles of right living, but these can not be taken up until our boy or girl has learned enough self-control to sit still and listen when spoken to. The sense of responsibility is, to my mind, the entering wedge by which right ideas and ideals may be taught. How can we impress the necessity for telling the truth upon the undeveloped child? Only by obliging him to act it; by showing him that, keep his word and live up to it he can and must. Upon this standard of conduct does his future reputation depend, a standard within the possibility and comprehension of all; a standard by which all children are judged alike and alike are judged by all concerned in a character school.

Then our boy must learn to work for his living instead of begging; to save his pennies for the day when his face will always be clean and he will wish to wear a collar. He must not tease deformed or little children; he must not expect more than his share of things, and be willing to give away part of that if necessary; he must at all times be ready to help others in whatever way he can, and remember to do such things without being told.

And these are the lessons that teachers in character schools teach, while the child sings a song, plays a game, or listens to a story, unconscious that anything has happened, except that he has found someone who wants to see him all the time, who cares about what he does, and believes (he has absolute confidence in her word by this time) that he is going to make one of the best boys she has ever known. Such an experience as this brings many changes with it. In time it brings application and self-control, varying of course in degree with the child's capacity, fitting him for school life and that larger school—the world. If this city, in neighborhoods where such children abound, would open preliminary character-training classes, preparatory to the lower grades, we should hear less about children out of school, require less money to enforce the compulsory law, and be rewarded by upright, patriotic, self-respecting citizens.

The recognition of the individual.—The next speaker, Dr. J. Madison Taylor, made a plea for the recognition of the individual in physical and mental treatment, and said that the first important thing in dealing with a child as an individual is to get some knowledge of his home atmosphere, particularly the mental and moral attitudes of the father and mother. The mother is the more important, because more constantly in association with her children. The father is not to be

ignored, however, because of his great influence for good or evil, his boys and girls looking up to him as a sort of superior being, the representative of authority. The average mother, while not educated to be a mother, must be taken as she is found. Next to the parents, the social environment in which the children live must be considered. While truth is truth the world over, yet what passes current for truth among the humbler class is very different from what is truth among the upper classes, and so, indeed, is selfishness. Teachers must bear in mind that the average mental concepts of children are less high than would be supposed from the apparent intelligence of their speech. The child will use language glibly enough, and yet have a meager knowledge of the meaning of the words. Dr. Taylor then made some suggestions as to how to approach the average child. Long experience had taught the speaker that much the best method is to treat the child as an individual, much like one would treat one's friends. To examine the mentally deficient child one must be careful to avoid circumlocution. When the child is suffering with physical defects or bodily ailments the mind reacts slowly, the apprehension is enfeebled, and the child appears to have a dull mind. The removal of the physical trouble will make a marked difference in the child's mental products.

The psychological and pedagogical problem of treating special classes of children.—Dr. Lightner Witmer, of the University of Pennsylvania, said:

Are there children in the public schools that require more individual treatment than can be given by the teacher of graded classes? If so, what can the public-school system do to supply the treatment that is necessary? The psychological problem concerns itself with the discovery of such cases as reveal on examination deficiencies that the present teaching force, as now organized, can not cope with. The pedagogical problem calls for a determination of the most effective methods to be employed by the public-school system in meeting this demand.

We teachers know that children differ greatly in mental and moral capacity. We try as far as possible to keep the members of a class together, and in doing this we grade according to age and examination average, and yet I believe that your experience is identical with mine, and confirms the opinion that a class of children, no matter how homogeneous the material may be, falls into three groups, or perhaps four. There are always a very few exceedingly bright and able members of the class. This section, the teacher is frequently told, can get on well enough by itself. These able intellects and effective moral characters generally get a minimum from the school curriculum. Unfortunately they are neglected, and it is not to be wondered at if later in school life they drop down below their relative level through the enervating effect of the daily dullness of the class room. Then there is another class at the opposite end, also not large in number, composed of the indifferent, lazy, or stupid boys, who drain the energies of the teacher, and by whom the teacher is unfortunately compelled to measure his efficiency. Lastly, there is the great middle section, composed of 50, perhaps of 60 or 75 per cent of the members, and divisible into two groups, one above and the other below an average.

Perhaps the same thought has occured to you that impressed itself upon me when a teacher in a preparatory school in this city, that the greatest improvement in school work would come from separating a class into three groups. I should like to have taught separately the three groups into which I could divide my classes, and to have treated them by radically different methods. I always regretted that, owing to the class system, they were not obtaining the best that I could give them, nor were they doing the best that might be expected of them, because so many of them were compelled to adjust themselves to a class of students to which they did not belong.

This rough estimation of individual differences within a class must be supplemented by careful examination, if we are to determine with security those pupils

that depart most markedly from the average of the class, and if we are subsequently to discover exactly wherein this departure is manifested, ascertain its causes, and finally suggest proper methods of treatment. Such an examination, if thoroughly made, should have due regard to hereditary tendencies, whether these be physical or mental, to the age and the condition in life of the pupil, to weight, height, lung capacity and muscular force, to hearing, to vision, to speech, to the rate of movement, to reaction time, to the time required in simple mental operations, to powers of attention, memory and imagination, to will power, and to moral characteristics.

If such examinations be carefully conducted, it will be found that there are now in the public schools many cases that depart widely from the average. Their defects are such that they need careful treatment if they are not to fall still more below the level of their fellows in the progress of life.

These children may be grouped into several classes. I have met with children in the Philadelphia schools who belong to each of these classes. The defects of some of them have been observed by their teachers; others have entirely escaped the teacher's observation. First, this class comprises those children who present moral characteristics that render their treatment in large classes impossible, no matter what the cause of moral deficiency may be. Second, those who are mentally and physically much below the normal child of the same age. These two classes of children alone comprise at least one per cent of the present school population. For their own benefit, as well as for the benefit of their teachers and fellow pupils, these classes of children should be instructed in special schools, equipped with a better-paid and more broadly educated teaching force than is needed for the average children found in the public schools Third, children who have defective hearing. I could cite case after case of children who have been called stupid, or inattentive, or lazy, or bad, merely because they could not hear what was said to them by their teachers. One child of the ninth B grade left school, and only discovered after he had tried to run an elevator that he was unable to hear a bell. He is now under treatment by a specialist for a defect of hearing which should have been corrected long ago. If this had been discovered in time, he would have had the opportunity of enjoying the education that the city is supposed to extend to all its children. Fourth, children whose powers of vision are defective. This, again, is a very numerous class, and I could cite many instances. One case is that of a boy who for years has seen double and the page of whose reader was so blurred when he looked at it that only with the greatest difficulty could he distinguish one letter from another. He is in the tenth B grade and is 14 years of age, but reads about as well as a boy who is half way through the first reader. That he stands as well as he does is an evidence of unusual industry on his part. That his defect was not sooner discovered is an evidence of the immediate necessity of proper examination of all children for the discovery of possible eye defects. This boy's eyes were treated by an oculist. He is now being taught to read and spell by one of his former teachers and by myself, because the school system makes no provision for such cases as his. The Penn Charter School, of this city, has taken a most advanced stand in this matter, requiring all boys in attendance to be thoroughly examined by specialists. Many defects of eyes and ears were found sufficiently serious to interfere with the school work. Fifth, children who have defects of speech. Proper articulation is not only necessary to convey ideas to other human beings; it is essential also for the harmonious development of the mind. A child with a defect of speech is liable to grow to be a mentally defective adult.

The pedagogical remedy is to be found in the establishment of special or ungraded schools for those classes of children that may be called disciplinary cases and for those of generally deficient mental development, and, secondly, in some provision by the proper school agencies for the discovery of cases of defective powers of

hearing, sight, and speech, and for the pedagogical treatment of the backward mental development consequent upon such physical defects.

Philadelphia's need of special schools.—Dr. Edward Brooks, superintendent of public schools, concluded the discussion, as follows:

There are several special schools under the control of the board of education but none belonging to the elementary grades, unless the James Forten School may be so regarded. We have children in our city of many different nationalities and of varying social and intellectual conditions, and it has been suggested that special schools be provided for them; but it does not seem to me to be necessary. A slight modification of the general curriculum, with an emphasis upon the industrial element of education, is desirable; but no new or different organization from that of our general elementary schools is needed to meet these conditions. The colored children, the Italians, Hungarians, and Russians all need the same general training for intelligent and industrious citizenship. The methods of teaching should be varied to suit their conditions, but no new organization into special schools is needed.

If special schools are desirable in connection with the system of elementary education, they should probably embrace two classes of pupils; first, those of low power and aptitude of mind who can not advance as rapidly as the other children; and second, those who are confirmed in truancy and stubborn disobedience. In respect to defective children, there are not enough of them in our schools at present to collect them into a distinct class; and it might be considered a remedy of doubtful expediency to take the small number now in our schools and place them in classes by themselves. The association of the weak-minded with strong or normally minded children is an advantage to the former, and so long as the number is small they are no special disadvantage to the normally minded pupils. Very serious cases of this kind should be placed in institutions similar to that of Elwyn, so long under the special care of Dr. Isaac Kerlin.

Not many troublesome pupils.—So far as pupils guilty of truancy and stubborn disobedience are concerned, we have so few of them as not to call for any provisions for special schools. Under our present system we have but little knowledge of truancy, for, without any compulsion in the matter of attendance, the boy whose parents can not compel him to attend school is on the street without the knowledge of school authorities. That there are hundreds of such boys who ought to be in school can not be doubted; but teachers have no official knowledge of it. So also in respect to inveterate disobedience; the boy of this kind who enters school is borne with for awhile, until the patience of teachers and school board is exhausted, and at last dismissed from the school, graduating often, no doubt, into the penitentiary.

Two years ago our State legislature passed a law providing for the compulsory education of the children of the Commonwealth. This law will probably be amended at the coming session of the legislature so that it can be put into execution. Then will come a new state of affairs in our public schools that will demand new arangements to meet new conditions. When all the children are compelled to attend the public schools we shall meet with cases of inveterate truancy and stubborn disobedience beyond the control of teacher or parent. To turn these boys on the street will be a menace to social order. It will, therefore, be the duty of the city to provide for their education, for the provision of a special school for the education of those boys is cheaper than the penitentiary for them when they become men.

Several cities where the law of compulsory education has been in force for some time have found it their duty to provide for this class of children. The special schools of Providence, described by Mrs. Esten, are, as she has stated, fulfilling a very important mission in her city. I have been deeply interested in her

description of them, and I believe the system is worthy of the careful consideration of educators. With so large a number of them in a comparatively small city it would seem that their schools are not restricted to incorrigible children unless the school population is unusually inclined to truancy and insubordination. It is, of course, a question whether the association of these children, unless they are extremely vicious, with obedient and refined children might not be an advantage to the former without any special disadvantage to the well-behaved children, so long as the number of defective children is insignificant. From present information there seems to be but a sprinkling of these children in our schools, and not enough in any neighborhood to make a special class for them. I propose, however, to make an early investigation to determine more accurately the number of such defective children in the schools, that I may be able to express a more definite opinion in respect to the establishment of special classes. Whether there will arise a demand for special schools for this class of children in our city when an education becomes compulsory is a question for the future to determine.

Provision for truant and disobedient pupils.—For a more confirmed class of truant and disobedient children there is no doubt we shall be called upon to provide. Boston is just entering upon this experiment with an institution called a Parental School. The necessity of this school is emphasized in Superintendent Seaver's report for 1895, in which, in referring to the school being ready to receive pupils, he remarks: "This is a welcome announcement, for it must be said that the state of things that has existed in relation to truants the past few months could not be endured much longer without grave peril." "Some truants," he continues, "have already ripened into criminals and have been sent down to the House of Reformation on criminal complaints; others—the greater number—have not been dealt with at all, because the Parental School was not ready to take care of them."

This experiment in Boston of a Parental School will be watched with great interest by the educators of the country. It was first proposed to call it a truant school, but the name was changed to the more appropriate and suggestive one of Parental School, indicating, not the provision of penalties for disobedience, but rather that fatherly care and guidance that lead to virtuous habits and an upright life.

Parental School of Boston.—The school is to be situated, as stated in the words of the law, "on the mainland, at some place removed from institutions occupied by criminal or vicious persons." It is entirely distinct from the Home of Reformation, the two belonging respectively to great, but distinct, functions of the State, the one being penal and the other educational. The law provides that the educational authorities, in case of uncontrollable truancy and disobedience, shall apply to the courts in order to remove boys from the control of their natural parents and place them under control of the parental schools. Before the establishment of this school incorrigible boys were sent to the reform school called the House of Reformation, where they were placed with the criminal classes, an institution in many cases which was a school of vice to them. The danger of this course caused the authorities to delay the coercive treatment of incorrigible boys until, as Superintendent Seaver remarks, "truancy ripened into positive criminality." By earlier commitments to the Parental School the first steps in crime will be prevented, and many boys, it is believed, will be saved from being sent to the House of Reformation.

The Parental School is to be in no sense a penal institution, designed to inflict penalties for truancy, but a school in which boys may be induced to remain by virtue of the attractive environments that may be thrown around them. The object is to make the school so attractive and surround the boys with such influences—with a minimum of coercion—as to develop the spirit of self-respect and intelligent self-control. It is hoped that the school will create a spirit and atmos-

phere of its own that will exercise a reformative influence upon all who come within its walls.

Incentives to good behavior.—As an incentive to good behavior it is proposed to apply to all who are committed to the Parental School the principle of the indeterminate sentence, so that though a boy might be committed for two years, his term could be shortened through good behavior and the manifestation of the right disposition. A system of licenses has been prepared whereby boys appearing to have acquired habits of regularity, punctuality, and self-control after six months' residence, shall be permitted to return to their homes on condition of attending the day schools regularly and behaving properly, which seems to be in accordance with the correct laws of reform.

This institution is provided exclusively for boys, but Superintendent Seaver recommends that a similar institution be established for girls. "Evidence enough," he says, "to convince the most skeptical of the need of such a school could be gathered from the principals of girls' schools and from the truant officers. Until this need is met," he continues, "it can not be said that the educational authorities of the city are doing their full duty by the wayward and morally exposed girls under their care."

We have not met this condition of affairs in our schools under the system of voluntary attendance. But if the law of compulsory education shall force all classes of girls into our schools we shall no doubt find cases of such abnormal moral conditions arising from heredity and vicious surroundings that a parental school for girls may become a necessity in our city.

I have referred quite freely in this discussion to the experiment about to be made in Boston, because they have already been confronted with the problem and have been working toward its solution for several years. I close my paper with another extract from Superintendent Seaver's report, which shows the relation of parental schools to the system of popular education and the necessity of their existence. "The State," he says, "has undertaken for its own protection to make education universal. To make education universal it must be made free, and it must also be made compulsory. Therefore no system of public education is complete without schools for truants, wherein are used the last resorts of compulsory education. When these fail, and not until then, can children rightly be surrendered by the educational to the criminal jurisdiction of the State."

In other words, it is only after the school has exhausted its power for reform that the prison shall be resorted to for punishment or protection. Only after the school shall have failed in its endeavor to train boys to virtuous citizenship should the penitentiary open its doors to protect society from the vicious and criminal classes. In another year it is probable that the law will by compulsion open the schools to many who are now growing up in ignorance and vice, and it is the hope of patriotic citizens that it may save many an unfortunate boy and girl from a life of vice and crime. Special schools of this kind will be found to be a necessity to society and the State.

An editorial of the Wisconsin Journal of Education touching upon the question under discussion may find room here, since the writer urges the establishment of separate classes for still another reason:

An ungraded department.—Among the improvements needed in many city schools is one of very great importance, if we look at the usefulness of the schools to the pupils and not merely to the perfection of the machine. An ungraded department, or in a very large city several such, could be made useful in these ways:

1. Those children who are out of grade for any reason and who therefore are thrown back into the next lower grade, or who are carried along with difficulty in

the grade for which they are only partly prepared, could have a much better opportunity for study in an ungraded department. It is true that efforts are frequently made to accommodate these children at the sacrifice of time and patience by the teachers. But the graded system is unfavorable to all who can not keep step with its regular march. Among those who are now out of grade and who need such an opportunity are those who have stayed out of school for sickness, those who have stayed out to work at home or elsewhere, those who have moved into the city from other places with a different course of study, and those idle or dull pupils who do not keep up with their grades. The mere enumeration of these classes shows that there must be many pupils who are out of grade for good reasons and whose needs ought to be carefully considered. Especially as pupils get into the upper grades of the ward schools are they apt to be needed by parents for work for irregular lengths of time. With an ungraded department such pupils could come back when not at work and at least finish the ward-school course. As it is, one or two attempts to keep up with their classes generally satisfies them that their education must close. It is very desirable that as many pupils as possible shall complete the ward-school course, which is the proper preparation for life and for citizenship. All the arguments for free schools for all children are arguments for so shaping these schools that no unnecessary barriers shall stand between the child and a good common-school education.

2. Another sort of children for whom an ungraded department is much needed are those whose deportment is so bad in the graded schools as to interfere with their own school work and that of others, and also those who frequently stay out of school without their parents' consent. These children are likely to turn out badly if simply expelled from school or allowed to drift away from it. They ought to be saved. An ungraded school with a skillful and firm teacher will save many of them from the idleness and other bad influences of the street. It is better to reform these children at home if we can rather than in a State reform school. In many cases these children are not very bad, only they have no great love for study, and the teacher has not tact or time to attract them. A little personal influence would save them, but that little is not given, for the reason that we can not get all the wisdom and patience and power of a great teacher for $30 a month. With cheap teachers we get cheap work. If this class of boys and girls are sent to the ungraded school, it will be necessary to have a man of special character and power of government as well as tact in managing and making school attractive. He must be a born teacher, but he need not be a great scholar.

Such an ungraded department ought to cost something. But it would pay, in relieving the regular schools of some hard problems and in saving the boys and girls.

SCHOOL SAVINGS BANKS.

School savings banks, also called penny savings banks, have been established in nearly all European countries during the last thirty years. They are especially numerous in France, Belgium, England, and Scotland, but less popular in Germany, Austria, Switzerland, and Italy. In Germany there are provinces and States, such as the Kingdom of Saxony, the Prussian provinces of Silesia, Saxony, and Posen, the duchies of Meiningen and Brunswick, in which every village and town has a school savings bank. In the city of Breslau thirty of the public schools have each a bank, but the grand total of

depositors and deposits is not equal to that of France and a few other countries. The first school savings banks ever established are found in Goslar (1820) and in Apolda (1833). Both towns are in Germany, Goslar near the Harz Mountains and Apolda in Thuringia.

Germany in 1896 had 1,728 school savings banks, with 227,442 depositors, which was an increase of 144 banks and 38,353 depositors over the previous year. The amount deposited in 1895 was 1,761,972 marks, or $419,349.34, while in 1896 the total amount was 4,716,440 marks, or $1,122,512.72, and the annual deposit was over a third of a million dollars.

France (according to a newspaper item accepted as authentic by the author of "XIII. Bericht des Vereins für Jugendsparkassen" in Breslau, Germany) had in 1893 more savings banks for school children than the German Empire had in 1896, to wit, 19,631, with 438,967 depositors and deposits of over 13,000,000 francs (about $2,600,000).

In *England* (according to the "Savings Bank," 1895, No. 20) the so-called postage-stamp savings banks are chiefly used by young people. In 1894 there were given out 133,000 savings cards at 1 shilling each and 69,500 at 4 shillings each. This gives a total of 419,220 shillings, or about $105,000. This manner of fostering thrift is introduced in 2,770 schools, or an increase of 279 schools over 1893. But there are also penny banks in 155 schools. Deposits are called for at stated periods by postal clerks and sent free of charge to the nearest general post-office. Two hundred and ninety-seven schools availed themselves of this generosity. The report of the department of public instruction for England and Wales for 1893–94 states that 8,548 schools have made provision for saving, an increase of 2,165 schools over the previous year. In Scotland 150 schools and in Ireland 130 schools have established banks during the year. These two states have altogether over 4,000 penny savings banks connected with schools. In 1894 there were distributed 275,000 bank-deposit books and 107,000 postal-savings cards.

Belgium.—L'Étoile Belge states the number of school savings banks in the kingdom to have been 5,282 in 1893. The total number of schools is 8,040. Of the whole number of pupils, to wit, 964,354, as many as 195,441 have bank books. To this number should be added 44,864 children whose savings amount to less than 1 franc in each case, and who are, therefore, not yet entitled to a bank book. Hence the whole number of children who save is 240,305, or an increase of about 20,000 over the previous year. The total amount of deposits was 5,165,228 francs, or $1,033,000; about one-half of this is to be deducted as having come from adults and pupils of secondary schools. The latest report shows an increase of 650,000 francs, or $130,000. The boys seem more inclined to save than the girls. In Germany and

other countries the reverse is found. Belgium had 131,485 boys and only 108,820 girls who deposited their savings, while the enrollment showed that there were only 50 fewer girls than there were boys in school. The Independence Belge, however, states that the 16 girls' schools in Antwerp had, in 1894, a larger deposit than the 18 boys' schools of that city.

Switzerland.—Local reports gleaned from newspapers prove that the idea of school savings banks is making commendable progress, but the federal statistical bureau reports that in 1896 only 280 primary or elementary schools had savings banks; 24 are about to establish them, and in 23 schools the banks have been abandoned. The entire canton of Zürich has only 20 such institutions.

Italy.—The report for 1890 indicated a large increase for the year 1888, since then the number of juvenile depositors and their deposits have decreased. The following numbers show this.

Year.	Depositors.	Deposits.
1888	.....	496,564 lire, or $99,300
1891	103,109	445,555 lire, or 89,100
1892	100,972	408,316 lire, or 81,660
1893	95,607	395,444 lire, or 79,000

Austria-Hungary.—There are no recent reports concerning school savings banks in the Austrian Empire.

United States of America.—Mr. J. H. Thiry, in Long Island City, N. Y., reports that on March 16, 1895, there were 323 schools in the United States in which 1,579 class-room savings banks were in operation. These schools are found in 83 cities. The number of depositors was 30,921, and the deposits amounted to $402,020.90, and withdrawals to $244,856.74, which left $157,164.16 in the banks. This does not give a correct statement, inasmuch as in 14 schools the deposits are footed up since the establishment of the banks. The reports of 20 schools were missing, and a previous statement was made in footing up the totals. However, since 1890, when 209 schools with 1,110 banks were reported, commendable progress is noticeable, for the number of schools having banks is (in 1896) 323, while the number of depositors has increased from 24,067 to 30,921.

In the Journal of Education (Boston) Mr. Thiry published (July 8,1897) a list of school savings banks in the United States, which is here reproduced.

School savings banks in the United States.

[Compiled by J. H. Thiry, of Long Island City, N. Y.]

Place.	Banks.	Date of introduction.	Depositors.	Amount.		
				Collected.	Withdrawn.	Due depositors.

NOTE.—It is suggested that only in a small number of States is the savings-bank system on a basis justifying a teacher or school officer in taking the responsibility of advising depositing in a particular bank, while in European countries the Government, through postal savings banks or otherwise, guarantees safety of the deposits.

ATTENDANCE IN BOYS' HIGH SCHOOLS IN THE KINGDOM OF PRUSSIA.

Prussia, the largest of the 26 States of the Empire of Germany, has a little more than three-fifths of the population of the Empire, 31,849,795 according to the census of 1895 (about one-half of the population of the United States according to the census of 1890). The population of the Empire of Germany was 52,246,589 in 1895.

The following table shows the number of boys' high schools of the six varieties in existence in Prussia, and the number of students attending them. These data are given for a number of years, dating back to 1830. The changes that have taken place within sixty-five years are very noticeable. While in 1830 the Kingdom had only 133 classical high schools (gymnasia), in 1895 there were 274 classical, 91 modern, and 86 mixed high schools, or 569 in all, with the incomplete institutions. The number of students has risen from about 35,000 in 1853 to 150,548 in 1895, or nearly 400 per cent within about forty years.

To explain the shifting from classical to modern schools, it may be stated that the gymnasia and progymnasia teach Latin and Greek and one modern tongue in addition to mathematical and natural sciences, history, geography, drawing, music, etc. The real-schulen teach no ancient but two modern languages, while the real-gymnasia are mixed institutions, in which Latin and two modern tongues are taught, but no Greek. The headings of the different columns state for what professions the schools are preparatory institutions. With these facts before us, we see that the modern high schools have increased greatly, while the classical schools have barely kept up with the increase of

the population, and have even decreased during the last eight years. This is explained by the overcrowding of the learned professions and the new demands which modern industry and commerce make.

No special schools are included in the table, that is, no secondary, technical, commercial, industrial, agricultural, or trade schools. The table includes only schools belonging to the State system of general education, i. e., general culture schools preparing for higher study in universities and technological institutions.

One reason for the increased attendance upon secondary schools in Prussia is that students of any secondary school (including normal schools), serve in the army only one year instead of three years, if they pass successfully through the first six grades. Another cause of the increase is found in the greater demands life makes upon trained intelligence, and the Prussian Government has ever been alive to these increased demands.

The following ratios are obtained from the totals of the year 1895:

Prussia had one classical high school for every 100,125 inhabitants, and 398 classical students to every 100,000 inhabitants.

Prussia had one mixed high school to every 212,322 inhabitants, and 88 students of such schools to every 100,000 inhabitants.

Prussia had one modern high school for every 349,997 inhabitants, and 93 students of such schools to every 100,000 inhabitants.

Taking the schools together, we find that Prussia had in 1895 one high school of some kind for boys to every 55,975 inhabitants, and 212 students in every 100,000 inhabitants.

The table presented below includes only boys' schools. There are not as many separate secondary schools for girls in Prussia, called "höhere Mädchenschulen," nor are they of such high grade as the boys' schools. Their course rarely goes beyond the eighteenth year of the pupil's age, but they are high schools in the American sense of the word. Exact statements of attendance are lacking, for they are mostly private schools. The number of girls in secondary schools is estimated at not less than 100,000.

This brings the number of students in secondary schools to 250,000. If we add to this the number of students in special schools, such as technical, industrial, trade, commercial, and agricultural, as well as normal schools, the total goes beyond 300,000, or 1 per cent of the population. Statistics have shown that one-fifth of the population in Germany, also in Prussia, is attending school. This raises the percentage of secondary students to 5 per cent of the population in school. It is doubtful whether the ratio can be found in any other country, unless it be in the United States, where many colleges might be classed among the secondary schools.

Attendance in boys' secondary schools of the Kingdom of Prussia.

Year.	Gymnasia, or classical high schools, preparing for the study of law, theology, medicine, philosophy and technology. Course, 10 years.		Progymnasia, or incomplete gymnasia; the higher grades are wanting. Course, 6 to 8 years.		Realgymnasia, or classical and modern high schools, preparing for the study of philosophy, medicine, and technology. Course, 10 years.		Prorealgymnasia or incomplete real gymnasia. The higher grades are wanting. Course, 6 to 8 years.		Higher realschulen or modern high schools preparing for technical pursuits. Course, 9 years.		Lower realschulen or modern high schools preparing for lower technical pursuits. Course, 8 years.		Total.

PROPORTION OF CATHOLICS, PROTESTANTS, AND HEBREWS IN SECONDARY SCHOOLS OF GERMANY.

In an article in the Akademische Revue, published in Munich, on "The proportion of Catholics, Protestants, and Hebrews in attendance upon secondary educational institutions of Germany," the following table is reduced from Professor Rethwisch's voluminous statistics in "Deutschland's höheres Unterrichtswesen im 19ten Jahrhundert."

There are in attendance upon secondary schools (i. e., preparatory schools for higher seats of learning):

	Of every 10,000 inhabitants.	Of every 10,000 Catholics.	Of every 10,000 Protestants.	Of every 10,000 Hebrews.
In Bavaria	53	42	67	370
In Prussia	45	27	50	333
In Saxony	40	23	40	357
In Würtemberg	84	53	93	500
In Baden	64	41	86	417
In Hesse	68	50	67	333

These 6 of the 26 States constituting the German Empire represent 87 per cent of the total population of the Empire.

According to the foregoing table fewer Catholics pursue a higher course of study than Protestants, and the Israelites far outnumber both.

Furthermore, Protestants and Israelites are also more strongly represented (proportionally) than Catholics in the so-called "realschulen" (modern high schools) of every German State. In these modern high schools (so named in contradistinction to "gymnasia," or classical high schools) comparison is less favorable to Catholics than in the more privileged classical schools, as the following statement proves:

In Bavaria 20 of every 10,000 inhabitants attend modern high schools and 33 attend classical high schools; that is, 13 Catholics, 29 Protestants, and 208 Israelites are found in modern high schools, and in gymnasia 29 Catholics, 38 Protestants, and 162 Israelites of every 10,000 of each of these creeds.

According to these figures in Bavaria there are one and one-third more Protestants than Catholics in the classical schools and two and one-fourth times more in schools without Latin. The Israelites outnumber the Christian creeds in the preparation of a business career, as well as in the preparatory education for professional service and the higher offices of public life.

These proportions are analogous in the other parts of Germany, as is represented in the following table:

PRUSSIA.

Of every 10,000—	Modern high school.	Mixed high school.	Classical high school.
Catholics	3	5	19
Protestants	8	14	28
Israelites	55	78	200

SAXONY.

Catholics	8	6	9
Protestants	15	9	16
Israelites	125	50	182

WÜRTEMBERG.

Catholics	21	.....	32
Protestants	50	.....	43
Israelites	320	.....	270

BADEN.

Catholics	9	12	20
Protestants	22	29	35
Israelites	117	149	151

HESSE.

Catholics	24	6	20
Protestants	30	12	25
Israelites	200	33	100

In all these States the same relations exist. Not only do Catholics attend the classical educational institutions less frequently, but they are not found in proportion to the other creeds in attendance at any kind of high school. Schools without Latin (for which modern languages are substituted) and the mixed high schools (with Latin, but without Greek) show this discrepancy in greater proportion than the classical schools (named gymnasia).

The paper quoted defines the main causes to be (*a*) the celibacy of the Catholic clergy, since the Protestant ministers' families furnish a large contingent of students to the high schools; and (*b*) the distrust which Catholics generally entertain against all kinds of State schools.

The numerical proof of quantitative retrogression of Catholics in regard to secondary and higher education indicates a qualitative disproportion in national intellectual life. The Catholics have no private institutions which could supply the apparent discrepancy. Details show an increase of the disproportion in Bavaria (as also in Prussia, Baden, and Saxony) during the period of 1863 to 1890. In 1863 the attendance at secondary schools of Bavaria showed a pro-

portion of 62.67 per cent Catholics, 34.27 per cent Protestants, and 3.06 per cent Israelites, while in 1890 the proportion had changed to 57.09 per cent Catholics, 36.09 per cent Protestants, and 6.82 per cent Israelites.

The well-known statistician, Professor Georg von Mayr, generalizes the above-mentioned data as follows:

In round numbers, out of every 10,000 inhabitants of the German Empire (excluding Oldenburg, which State does not publish statistical data of public education) 50 attend secondary schools, or 55 students of every 10,000 Protestants; 32 students of every 10,000 Catholics; 49 students of every 10,000 Dissenters; 333 students of every 10,000 Israelites; which gives an average of a fraction less than 50 for the entire population.

If a distinction be made among the different kinds of secondary schools, Würtemberg must be left out of consideration, because of the lack of appropriate data. The following result is then obtained:

Number of students out of every 10,000.

	High schools with Latin and Greek.	High schools with Latin.	High schools without Latin.
Catholic population	21.4	3	6.7
Protestant population	27.7	13.2	13.5
Dissenting population	17.7	13.2	18.7
Hebrew population	173.8	65.8	92.7
Total population	27.2	10.4	11.4

Consequently, the total population of Germany enjoys a secondary education to the extent of 50 out of 10,000 inhabitants, or 5 per 1,000; whereas, distinguishing the population by creeds, the proportion is: Thirty-two of every 10,000 Catholics, 55 of every 10,000 Protestant, and 333 of every 10,000 Israelites.

Professor von Mayr states further, that proportionately the difference is smallest in the classical schools. Not quite 28 of every 10,000 Protestants pursue the classical courses; about 21 out of every 10,000 Catholics. The Israelites alone show a strong diminution in this case as compared with the previously stated ratios, showing a proportion of nearly 174 to 10,000. The difference between Catholics and Protestants at other high schools of both kinds is relatively much greater. Combining the two kinds of schools, from 10 to 11 out of every 10,000 Catholics, almost 26 out of every 10,000 Protestants, and more than 158 out of every 10,000 Israelites pursue a high-school course of study without Greek or without either classical language.

Professor von Mayr shows, with reference to the gymnasia in Bavaria, that since 1873 the attendance of Catholics contrasted with Protestants has only slightly decreased; the attendance at technical

courses was small even at that time. He closes his article with these words:

In the struggle for existence the Catholic population of Bavaria undoubtedly needs the equipment of knowledge and power to be acquired by attendance at secondary and higher seats of learning; for by not attending secondary schools they exclude themselves from universities and professional schools. It is, therefore, the earnest duty of all concerned to investigate and establish the causes of the nonattendance of Catholics at such schools, whether the opportunity given be not accepted or whether the opportunity required be not offered by the State.

And he further says:

I should like to warn my readers not to draw immediate conclusions from the relative proportion of the different confessions upon the talent or inclination of the students, or the confession to which they belong. There are other considerations that determine the real participation in any branch of education besides talents and inclination, and among these are the ease or difficulty of attending certain schools. These are dependent upon the habitation of the parents and the location of the schools. Doubtless the residents of any place or city furnish the comparatively greatest contingent of students. Now, it must be considered that the Jewish population is nearly always found in large cities which have a variety of schools beyond the scope of the elementary schools. Hence, we find the Jewish children more frequently in secondary schools, while the Catholics are chiefly agriculturists, farmers, and the like, and live in hamlets, villages, and small towns, which do not offer such opportunities for secondary education as large cities do. Similar proportions are found where the members of one confession are preferably grouped in larger cities, as, for instance, the Protestants in upper Bavaria, where the participation of Protestants in secondary schools is comparatively larger than in lower Bavaria, where they are found both in the cities and in rural districts.

To the foregoing details another writer, Professor von Salvisberg, adds a few data taken from the Prussian educational statistics, which are of general interest.

The attendance of the different creeds at secondary schools of Prussia from 1886 to 1890–91 averages the following proportions, expressed in percents[1]:

	Protestants.	Catholics.	Israelites.
Schools without Latin or Greek, but modern languages:			
Burgher schools	73.40	17.76	8.49
Modern high schools (low grade)	66.58	17.87	15.07
Modern high schools (high grade)	78.57	14.30	6.39
Schools with both modern and classical languages:			
Mixed high schools (low grade)	77.09	16.54	5.37
Mixed high schools (high grade)	78.21	12.20	9.10
Schools with Latin and Greek and only one modern language:			
Classical high schools (low grade)	51.59	40.94	7.34
Classical high schools (high grade)	68.28	22.45	9.10
Total	70.78	20.01	8.94

[1] Compare Prussian Official Statistics, vol. 125, issued by the minister of public education, and Statistics of the Universities of Prussia for the year 1891–92. Berlin, 1895.

This showing should be completed by stating the proportion of the different creeds in the population, which is here given for Germany and for Prussia and Bavaria separately:

In 1890 Germany had 49,428,470 inhabitants, of whom there were 31,026,810 Protestants (62.8 per cent), 17,674,921 Catholics (35.8 per cent), and 567,884 Israelites (1.2 per cent).

In 1890 Prussia alone had 29,952,675 inhabitants, of which there were 19,232,449 Protestants (64.2 per cent), 10,252,818 Catholics (34 per cent), and 372,059 Israelites (1.2 per cent).

In 1890 Bavaria alone had 5,484,475 inhabitants, of which there were 1,571,863 Protestants (28.6 per cent), 3,962.941 Catholics (70.2 per cent), and 53,885 Israelites (1.2 per cent).

According to the foregoing figures the Catholic attendance at secondary schools falls short by more than one-third in comparison with the total population of the State of Prussia, and gives its share to the Protestant and Hebrew population. Israelites send almost eight times as many pupils to these institutions as would be expected from their proportion to the other creeds. If the creeds were distributed in attendance at school in proportion to the male population, there would be about 87,000 Protestant students, 47,000 Catholics, and 1,600 Jews.

The distribution of the different creeds among professional and business men is noticeable. If we take for granted that almost all who enter the higher State and municipal service are graduates of classical high schools and determine in what proportion the different creeds graduate, the percentage of classical school graduates (for the period of five years above mentioned) will be found to average 68.5 per cent for Protestants, 23.3 per cent for Catholics, and 8 per cent for Jews, or almost the same difference as is revealed in reviewing the attendance at gymnasia.

Calculating from the statistics of Prussian universities for the years 1886–1890, we find that among 100 students from German States 71.96 were Protestants, 18.73 Catholics, and 8.98 Hebrews. The correct numbers for this calculation are given below. During the above mentioned five years the universities of Prussia were attended by students from the German States as follows:

Faculty of—	Protestants.	Catholics.	Jews.	Total.
Protestant theology	2,562			2,562
Catholic theology		581		581
Law	1,706	441	193	2,340
Medicine	2,073	741	644	3,458
Philosophy	2,748	603	297	3,648
Total	9,089	2,366	1,134	12,589

These figures show the conspicuous differences existing between the nontheological faculties in reference to the three creeds. Taking

these alone and expressing the facts in per cents, we find among students from German States the following ratios:

Faculty of—	Protestants.	Catholics.	Jews.
Law	72.66	18.78	8.22
Medicine	59.72	21.35	18.55
Philosophy	74.92	16.44	8.10
Average	68.80	18.82	11.95

The participation of the Hebrews in higher education keeps pace with the advancement of the grade attained. The number of Catholics who aim at a career which implies a university course in Bavaria is apposite to Prussia also.

As stated above, the deeper reasons for this fact are not apparent and can not be statistically determined. The fact itself is defined in the following figures: During the period specified the number of Prussian students averaged 7,898 Protestants to 9,411,161 Protestant male inhabitants; 2,249 Catholics to 5,058,292 Catholic male inhabitants; 1,044 Hebrews to 182,738 Hebrew male inhabitants; 33 others to 49,960 other male inhabitants; a total of 11,224 students to 14,702,151 male inhabitants.

This goes to show that of every 10,000 male inhabitants of each creed there averaged 8.37 Protestants, 4.45 Catholics, and 57.13 Israelites; on the whole, 7.62 students. The great variations in university attendance among the different creeds permit a conclusion upon anomalous conditions. The Catholic population yields a little more than half as many students as the Protestant. The Hebrew, on the other hand, sends proportionately thirteen times as many students to universities as the Catholics and seven times as many as the Protestants. If we examine the conditions mentioned, even in a single province of the Kingdom, the freshmen from the Catholic population approach the average Protestant attendance only in Westphalia, Hanover, and East Prussia. In the other nine provinces the facts portrayed are repeated even with greater force. It appears, therefore, that a combination of manifold conditions, external and internal, economic and social, has developed permanent relations which in their effects upon the intellectual life of the nation must be far-reaching and powerful.

EDUCATIONAL STATISTICS OF THE KINGDOM OF BAVARIA FOR THE YEAR 1893-94.

The Zeitschrift des Bayerischen Statistischen Bureaus No. 4 of 1895 contains the latest educational data of Bavaria. A summary of this official publication is here given in translation, in which the

schools and other institutions of training are grouped somewhat after our American nomenclature.

A.—Elementary Schools.

I.—DAY SCHOOLS.

The number of elementary day schools in the Kingdom (population in 1895, 5,797,414) was 7,253, of which 346, or 4.8 per cent, are located in the cities (which term embraces the cities of the first rank on the right side of the Rhine and the eleven large cities of the Palatinate), and 6,907, or 95.2 per cent, in the rural districts and villages. In the previous year the numbers were 7,239 schools, of which 342, or 4.7 per cent, were situated in cities, and 6,897, or 95.2 per cent, in the country.

Classed according to the character of their administration, there were 7,203, or 99.3 per cent, public, and 50, or 0.7 per cent, private schools. There has been no change in this proportion since the preceding year.

Classed according to their religious character, there were 5,114, or 70.5 per cent, Catholic (1892–93, 5,103, or 70.5 per cent); 1,910, or 26.3 per cent, Protestant (1892–93, 1,909, or 26.4 per cent); 141, or 2 per cent, mixed schools (1892–93, 139, or 1.9 per cent), and 88, or 1.2 per cent, Hebrew schools (1892–93, the same number).

If we consider the sex of the pupils, we find that there are 6,280, or 86.6 per cent, mixed schools in all classes—that is to say, schools in which the sexes are not separated. In the previous year this proportion was 86.8 per cent. Four hundred and twenty-seven, or 5.9 per cent (1892–93, 416, or 5.7 per cent), are exclusively girls' schools; 425, or 5.8 per cent (1892–93, 417, or 5.8 per cent), boys' schools, and 121, or 1.7 per cent (1892–93, 125, or 1.8 per cent), are mixed schools in some of the grades only.

If we classify the schools according to the length of their daily sessions, we find that 6,978, or 96.2 per cent, are all-day schools; 238, or 3.3 per cent, are half-day schools, and 37, or 0.5 per cent, have a partly whole and partly half day session. The proportions for the preceding year were as follows: 6,942, or 95.9 per cent, whole-day schools; 259, or 3.6 per cent, half-day schools, and 38, or 5 per cent, mixed schools.

The number of classes in all the schools is 13,625 (in 1892–93, 13,524), of which 2,775, or 20.4 per cent (in 1892–93, 2,731, or 20.2 per cent), are found in cities, and 10,850, or 79.6 per cent (in 1892–93, 10,793, or 79.8 per cent), in rural districts. Of the total number of classes, 1,092, or 8 per cent, are parallel classes of which 941, or 86.1 per cent, are found in city schools, and 151, or 13.8 per cent, in country schools.

The total number of teachers is 24,252 as against 24,101 in the previous year; of these 13,714, or 56.5 per cent, are class teachers—i. e., teachers in charge of class rooms—(in 1892–93, 13,611) 6,124, or 25.3 per cent, are teachers of religion, and 4,414, or 18.2 per cent, teachers

of gymnastics, drawing, and female handiwork, i. e., special teachers. Of the 13,714 regular class teachers, there are 11,707, or 85.4 per cent, men, and 2,007, or 14.6 per cent, women. Of the 4,414 specialists, only 122, or 2.8 per cent, are men, and 4,292, or 97.2 per cent, are women. The 6,124 religious teachers are all men.

Classifying the 24,252 teachers according to religious denominations, we find that 17,942, or 73.9 per cent, are Catholics (12,352, or 50.9 per cent, men, 5,590, or 23 per cent, women); 6,126, or 25.26 per cent, Protestants (5,428, or 22.38 per cent, men, and 698, or 2.88, per cent, women); 179, or 0.74 per cent, Israelites (169, or 0.7 per cent, men, 10, or 0.4 per cent, women); 5, or 0.2 per cent, belong to other denominations (4 men, 1 woman).

There are 1,033, or 7.5 per cent, of the regular class teachers who belong to religious orders. Of these 28, or 0.2 per cent, are men; 1,005, or 7.3 per cent, of the whole number are women.

The total number of day-school pupils in the Kingdom was 819,565; of these 146,004, or 17.8 per cent, attended city schools; 673,561, or 82.2 per cent, attended rural schools; 402,082, or 49.1 per cent, were boys; 417,483, or 50.9 per cent, were girls; 585,210, or 71.4 per cent, were Catholics; 227,896, or 27.81 per cent, were Protestants; 5,789, or 0.71 per cent, were Hebrews; 670, or 0.08 per cent, were of other creeds.

For the previous year the corresponding numbers were 144,550, or 17.7 per cent, attending city schools; 673,039, or 82.3 per cent, attending rural schools; 400,379, or 49 per cent, were boys; 417,210, or 51 per cent, were girls; 581,908, or 71.17 per cent, were Catholics; 228,961, or 28.01 per cent, were Protestants; 6,050, or 0.74 per cent, were Hebrews; 670, or 0.08 per cent, were of other creeds.

The foregoing numbers permit a comparison which reveals (1) that the city population in Bavaria increases, though not at the expense of the rural population; (2) that the number of Catholic school children increases, while that of Protestant children decreases. The differences shown are small, but they are the result of only one year.

In 1893–94 there were 2,907,940 separate cases of absence recorded, amounting to 5,333,398 days, which is an average of 6.4 days for each child. The amount of absence during the previous year was about 6.5 days for each child. Of the 2,907,940 cases of absence, 446,247 occurred in city schools (15.3 per cent), 2,461,693 (or 84.7 per cent) cases in country schools. Since 17.8 per cent of all pupils are attending city schools, the difference is comparatively slight.

Of the total number of cases of absence only 158,862, or 5.5 per cent, were not excused, and hence the law took effect, according to which the parents were fined. In 2,086,637 (or 71.7 per cent) cases, the excuse was illness, and in 662,441 (or 22.8 per cent) cases, other valid excuses were offered and accepted.

Instruction was given in 7,538 buildings (in 1892–93, 7,511), of

which 338, or 4.5 per cent, were located in cities; 7,200, or 95.5 per cent, in the country and villages. Furthermore, 7,102, or 94.2 per cent, were school buildings owned by the communities (in 1892–93, 7,087); 436, or 5.8 per cent, were rented buildings (in 1892–93, 424). All these buildings numbered 13,909 schoolrooms, against 13,823 of the year preceding.

Tuition fees were paid in 5,502 schools, or in 75.9 per cent of the total number of schools, amounting to 1,615,417 marks, or $384,469.25. The city children contributed only 4.5 per cent of this sum, which shows that the principle of gratuitous elementary instruction is also making progress in Bavaria. In Prussia and other States of Germany the principle is now rigidly carried out. The people in Germany are gradually adopting the American popular idea that compulsory elementary education presupposes or necessitates gratuity.

During the year 1893–94 there were 3,211 cases of death among school children (in 1892–93, 2,923); 514, or 16 per cent, occurred in cities, and 2,699, or 84 per cent, in the country; 1,488, or 46.3 per cent, cases were boys, and 1,723, or 53.7 per cent, cases were girls. The percentage of cases of death was 0.4 per cent of the whole number of school children.

II.—SUNDAY SECULAR SCHOOLS.

The total number of pupils in Sunday secular schools (so-called supplementary or continuation schools) in 1893–94 amounted to 297,245. Of these, 35,980, or 12.1 per cent, were in cities; 261,265, or 87.9 per cent, were in rural districts; 131,434, or 44.2 per cent, were boys; 165,811, or 55.8 per cent, were girls; 216,670, or 72.89 per cent, were Catholics; 79,115, or 26.62 per cent, were Protestants; 1,287, or 0.43 per cent, were Hebrew; 173, or 0.06 per cent, were of other creeds.

During the preceding year the total number was 304,227, hence a decrease of 6,982 in one year which the official reports do not attempt to explain.

III.—DISMISSALS BEFORE COMPLETING THE COURSE.

On account of peculiar conditions provided for in the Bavarian law of compulsory elementary education, the following number were dismissed by way of dispensation before completing the course: 762, or 0.093 per cent, day-school pupils; 109, or 0.036 per cent, Sunday-school pupils; 48, or 0.006 per cent, day-school pupils in the cities; 714, or 0.087 per cent, day-school pupils in the country; 19, or 0.006 per cent, Sunday-school pupils in the cities; 90, or 0.030 per cent, Sunday-school pupils in the country.

IV.—EXPENDITURES FOR ELEMENTARY SCHOOLS.

The total amount of expenditures for elementary schools, both day and Sunday schools, in so far as they include appropriations on the part of communities and the State in 1893–94, was 18,070,708 marks,

or $4,300,828, to which should be added the tuition fees mentioned before, to wit, $384,469; grand total, $4,685,297. Taking both day and Sunday school pupils together (namely, 1,016,810), we find the expense per capita of the school population to be $4.60. If the Sunday-school pupils are excluded from this calculation, which may properly be done since they are taught by the teachers of the day schools, the per capita expense would be $5.95. The per capita expense of the population was a little less than $1.

The salaries claimed 56.9 per cent of the total expenditure, while new buildings, heating and lighting, and other repairs claimed 43.1 per cent. The expenditures other than for salaries are specified as follows: 44.2 per cent for new buildings, 13 per cent for repairs, 17.8 per cent for heating and lighting, 2.3 per cent for furniture, 3.9 per cent for apparatus and devices for teaching, 18.8 per cent for other school purposes.

V.—SALARIES OF TEACHERS IN ELEMENTARY SCHOOLS.

The total income of all elementary teachers in Bavaria in 1893–94 was 18,354,719 marks, or $436,842. This amount was distributed as follows: 97.5 per cent to the regular teachers, to wit, 85.2 per cent to class teachers, 8.7 per cent to principals, 6.1 per cent to assistants, 2.5 per cent to religious and special teachers, 2.5 per cent to inspectors.

The official report from which these data are taken states, also, the sources of the teachers' income, to wit, 54.1 per cent from municipal or district taxes and funds, 10.2 per cent from provincial funds, 25.1 per cent from State funds, 5.6 per cent from the church for services performed as organist and sexton, 5 per cent for services as secretary of the town council or other services.

The sources of income of religious teachers are: 95.7 per cent from municipal and district taxes, 4.3 per cent from provincial funds, while no State funds are used for this purpose.

B.—Continuation Schools.

In Germany the term "continuation schools" is used for day schools, evening, and Sunday schools in which children over 14 years are taught for the purpose of securing the results of elementary school work and to prepare boys somewhat for future occupations; hence they are variously called simple continuation schools, industrial continuation schools, and agricultural continuation schools. In some parts of the country the town authorities make attendance at such schools compulsory between the fourteenth and eighteenth year of life.

Bavaria had, during the year 1893–94, as many as 257 industrial continuation schools (in 1892–93, 253). Of these schools, 208 were independent and 49 were connected with high schools without Latin. In 169 schools of this kind the attendance was obligatory by municipal statute.

The number of pupils at industrial continuation schools amounted to 32,286 (in 1892–93, 31,321), of which 578, or 1.79 per cent, attend day courses, and 31,708, or 98.2 per cent, the night and Sunday courses. Of the pupils of the last-mentioned courses 23,597, or 68.26 per cent, are taught in the elementary division, and 10,971, or 31.74 per cent, in the industrial or special classes. It will be noticed that the two numbers added together are greater than the sum total of pupils. This is owing to the fact that many pupils are in both elementary and special classes.

The number of teachers in these industrial schools was 1,647 (in the previous year, 1,592); 64, or 3.89 per cent, of these were employed exclusively for elementary work. The total amount expended was 602,434 marks, or $137,379, of which sum 75.84 per cent was used to pay teachers' salaries.

The number of agricultural continuation schools was 447, among which were 12, or 2.68 per cent, kept open only in winter. The number of pupils in these schools was 8,280 (in 1892–93, 9,022). Of these, 536, or 6.47 per cent, attended the winter schools. Seven hundred teachers were employed in agricultural continuation schools, of whom only 6 were not also engaged in teaching elementary schools.

The total amount expended for agricultural continuation schools was 160,779 marks, or $38,265, of which sum 57 per cent was used to pay teachers' salaries.

There is still another kind of continuation schools in Bavaria, to wit, forestry schools. In 1893–94 Bavaria had 5 institutions of this kind, with 252 pupils and 24 teachers. Tuition and matriculation fees in these schools amounted to 5,119 marks, or $1,218, while the expenses were 32,198 marks, or $7,663. Ten of the teachers were expert foresters.

C.—Secondary Schools.

The following table gives the official data with reference to secondary education in Bavaria:

Kind of schools.	Total number of schools.	Private schools.	Teachers.	Pupils.	Extra attendants.
High schools with Latin and Greek	37	.....	999	16,358	.....
High schools with Latin only	49	8	481	3,368	.....
High schools of mixed character	4	.....	66	551	.....
High schools without classical languages	58	7	929	13,280	84
Industrial schools	3	.....	49	433	47
Schools for the building trades	5	.....	104	1,867	.....
Commercial schools	8	5	110	1,234	60
Schools of industrial art	2	.....	44	417	87
Preparatory schools	44	8	235	1,994	.....
Normal schools (male and female)	22	9	203	1,240	20
Music schools	13	6	67	1,341	557
High schools for girls	132	103	1,609	13,737	251
Schools of female industries	36	34	143	3,199	.....
Normal schools of female industries	6	5	29	73	30
Agricultural schools	6	.....	67	332	1
Normal school for gymnasts	1	.....	4	343	.....
Professional schools	45	15	113	2,682	18
Other private schools	3	3	20	133	.....

D.—Higher Education.

The number of students in all the institutions for higher education in Bavaria amounted to 9,158 during the winter semester of 1893–94. The following table gives the details:

Institutions.	Students in winter.	Students in summer.
University of Munich	3,464	3,798
University of Würzburg	1,352	1,300
University of Erlangen	1,105	1,164
Seven theological lyceums	770	739
Academy of Fine Arts	419	340
Polytechnicum of Munich	1,327	1,317
Forestry Academy	111	103
Veterinary Academy	194	169
Conservatory of Music	269	269

Degrees were conferred in the three universities as follows: 292 in winter, 295 in summer; 202 degrees were given to Bavarian students, 385 to students from other German States or to foreign students. The following table gives the results of the examinations for promotions, that is to say, of candidates for State offices:

	Candidates examined.	Candidates passed.	Per cent.
Three universities	1,131	831	73.5
Seven theological lyceums	174	174	100
Polytechnicum	269	222	82.5
Academy of Fine Arts (has no final examination)			
Forestry Academy	86	79	91.9
Veterinary Academy	31	21	67.7
Conservatory of Music	18	18	100

EXTRACTS FROM AN ESSAY ENTITLED "THE LATEST MOVEMENTS IN EDUCATION IN THE UNITED STATES."

In a discussion in the "Zeitschrift für ausländisches Unterrichtswesen" on this subject Dr. Schlee, who was a member of the famous December conference in Berlin, called by Emperor William for the purpose of simplifying the courses of study in secondary schools, and who visited the United States during the Columbian Exposition, makes some pointed remarks concerning the reports of the committee of ten and the committee of fifteen appointed by the National Education Association.

After a thorough review of the work of the committee of ten and its subcommittees, he closes with these words:

The fundamental points which the committee of ten recognizes as fixed are (1) that the number of lessons per week be not increased, (2) that the conditions of admission to college be not increased, and (3) that the principle of unity upon which the common school rests be not disturbed. This last-mentioned point meets all demands for a differentiation or bifurcation previous to the eighth year of the course. In other words, that the pupils intending to enter college and those

intending to devote themselves to business pursuits should have precisely the same elementary instruction. Yet the committee declares it impossible to prepare a suitable programme for the secondary school having a course of four years if it be built on the present course of the common school. Either instruction in foreign languages, mathematics, and natural sciences should begin in the elementary school or the secondary school should begin two years earlier, and leave only six years for the elementary school. It is claimed that elementary instruction, both with regard to matter and method, is continued too long. In all the sub or special committees the complaint was heard that the high school did not find sufficient preparatory knowledge in the pupils, and that it had to begin with all secondary branches at the same time.

Of all claims for an earlier beginning of secondary branches none was more emphatic than that for foreign languages. The valuation of modern foreign languages is naturally different in America from the European, for the American does not recognize the need of them as languages of communication. Still, knowledge of foreign languages is considered by him of great value for the training of the mind, especially for a more thorough comprehension of the mother tongue, although this is not attributed to the power of a special formative and logical training as it was formerly in relation to Latin grammar. On the other hand, the comprehension of the German language is acknowledged as a means to a recognition of German science. While the committee in its general discussion emphasized more the pedagogical gain arising from the study of foreign tongues, in the details of its plan of study it points to this more practical aim. The report does not arrive at a complete equalization of these different aims.

The committee goes farthest in its recommendations concerning modern languages, the chairman designating this as most novel and striking. They are, that German or French be introduced as a regular study in the fifth school year, tenth year of age. The report adds that Latin would offer the same advantages, but living languages seemed more suitable for grammar schools, as the upper grades of the common schools are called.

The subcommittee on Latin considers it desirable to increase the demands in that study and regrets the fact that the study of Latin is commenced at a much earlier date in England, France, and Germany as compared with America. Still the committee thinks it undesirable to make a radical change, and is satisfied with the suggestion of beginning Latin one year earlier, devoting to it five hours per week. The committee on mathematics likewise advocates earlier occupation with geometry, and so, too, the committee on natural sciences claims several years for instruction in simple natural phenomena, in botany, zoology; and again, the committee on history calls for two years of study in history, American and universal history.

The question arises whether all these proposals can be united within the limits of the common school system. Doubtless some changes might be introduced in the grammar school easily without doing violence to its character as a common school. For instance, concrete geometry may be added to mathematics; that is, the introduction to the study of geometry by means of the senses and with the aid of drawing, measuring, without formal proof. Instruction in natural sciences may also be limited to a discussion of important phenomena, animals, and plants. But the unity of the system becomes questionable when instruction in modern tongues as an optional branch is introduced; still more by the introduction of Latin, ancient history,

and algebra as optional branches. These subjects should become compulsory branches during the last year's course of the elementary school. It is true ancient history does not seem as necessary for the Americans as it is for the Germans, because they have no history of the Middle Ages of their own, although their language and literature have borrowed much more from antiquity than we have. Consider the many antique proper names in America, as for instance, Athens, Sparta, Ithaca, Cincinnati, Capitol, etc. A connected history of classic antiquity is not related to the general culture of the people, and receives its value only in connection with higher education. And yet there is a proposition to teach Latin one or possibly two years in the elementary school. The subcommittee for instruction in Latin and the entire committee of ten leave this point somewhat unexplained and merely propose an earlier beginning, while at the same time offering suggestions tending to make the former nonactive.

In contradistinction, the committee of fifteen takes up Latin, with five lessons per week during the last school year of the course of the elementary school, and at the same time definitely adheres to the principle that the instruction for boys and girls should be precisely the same to the fourteenth year of age. This committee expects much from these weak beginnings in Latin, which are not continued, as it also does of algebra. Quite contrary to the sometimes excessive demand, heard in Germany also, for a definite conclusion and finish of the elementary education, the committee is of the opinion that a brief instruction in secondary subjects, like Latin and algebra, has a higher value than any elementary branch that might be substituted for them. Especially a year's instruction in Latin would place a pupil far above those who only studied English grammar, without Latin, for the beginning of any branch (discipline) lays special weight upon its fundamental ideas. During the first week of Latin lessons, the pupil is made acquainted with the remarkable phenomenon that a language can express by declensions and conjugations what his mother tongue does by means of prepositions and auxiliaries (English: to him, Latin: ei). He learns with astonishment that quite a different order of the words in syntax is to be followed, and that root words have still a concrete meaning, while the same words or their derivations in the mother tongue are abstract. These observations are mental germs, which grow and result in a better mastering of the mother tongue. Similarly the result of studying the elements of algebra are judged. For a young philosopher this might be found true, but for the majority of elementary pupils they are imaginings devoid of substance.

In this question we may see the pivotal point of the whole present educational movement in America. The weakness of secondary education is correctly recognized. The attempt ought to be made to begin earlier with foreign languages and mathematics, but any attempt to fit this plan for the entire common school, which naturally finds much opposition in America, must miscarry. Moreover, since the grammar school in the South and everywhere in rural districts closes with the sixth school year, America will have to follow the example of all other civilized countries and allow the high school and the elementary school to go side by side for a number of years. The propositions of the committee of fifteen, compared with those of the committee of ten, appear to us as a step backward.

* * * * * * *

With reference to the organic connection between the high school,

college, and university, the committee of ten entertains the opinion, based upon actual conditions, that the course of study should be arranged essentially for those boys and girls who do not intend to continue their studies in a higher seat of learning; that is to say, those who do not intend to enter the college, and that a preparation for higher education could only be a secondary object of the high school. But starting from the theoretic presupposition that the chief branches, if treated thoroughly, are, as regards their formative power, of equal value for admission to college, the committee considers it right that the colleges make special conditions regarding the extent and duration of school studies and require proofs as the committee on English, for instance, does by demanding that no pupil be admitted to college who can not write good English. But on the whole the committee seems to favor the suggestion that a satisfactory graduation from a four years' course be considered a suitable preparation for college or any other scientific institution. In other words, that the examination for graduation in the high school do away with an examination for admission to college; and the committee considers this profitable for the schools, colleges, and the entire country.

The subcommittees of the committee of ten express themselves in detail concerning the method of instruction. Their reports show that pedagogical theory in the United States is everywhere abreast with the present status of science, and that it is very familiar with German pedagogy and psychology from Pestalozzi to Wundt. Although the statements do not bear the character of borrowed thought, but appear to have been thought out independently, still special portions bear a very familiar face; thus, for instance, when the committee on history speaks of political economy (Volkswirtschaftslehre). There is not another question in which the persons consulted show a greater variety of opinion. Some distinguished superintendents and principals wish to have this branch taught during the last year of the high school course; some even demand daily instruction for twelve weeks; other teachers declare that there is no place for that branch in the secondary school. Under the circumstances the committee thought it wise not to recommend formal instruction in political economy, but that the most important principles be presented in connection with the history of the United States and commercial geography. The subject would therefore appear first in its most elementary features during the third year of the grammar school, and then again during the last two years of the high school. It would appear not as a special science, but as an explanation of conditions of the commonwealth and of political questions.

Observe this passage concerning the mother tongue: "Both with reference to the high school and the lower schools, the committees declare that every teacher, in whatever branch he may instruct, must consider himself responsible for the use of good English on the part of his pupils." Similar to the committee on natural science, the committee on history emphasizes the necessity of written accounts, narrations, and other compositions; and if the propositions of the nine committees become realities there would be at least one written composition daily for every pupil, which, in the interest of good English, is important.

In the face of the method of instruction in vogue in America it is particularly remarkable that all these committees consider the acquisition of mere knowledge not the aim of education, but the development of the mental powers and comprehension, exercises in observing,

developing thought and expression. For this reason the various committees intend to limit the use of the text-book method and recommend its exclusion from grammar schools in studies like grammar, mathematics, and natural sciences. This method may be explained as follows: The text-book or guide is first studied, i. e., memorized by the pupil, mostly in school in so-called study lessons, and then the teacher asks for the contents of the lesson during recitations. While this reciting is going on he explains, corrects, and enlarges the matter as occasion demands. The committee of fifteen (whose report on method of instruction, written by Dr. Harris, takes its stand more on the solid ground of existing circumstances, not merely from necessity, but also from appreciation of these circumstances) gives special instruction for the treatment of this method, and recommends, for instance, the dividing each class into two divisions, so that the one study (memorize) while the other recite. The committee of ten, however, and especially its subcommittees, make oral lessons—that is, free instruction by the teacher—everywhere the principal thing. They wish that the teacher lead the child to observe and to start from observation and experience. In the interest of geography and natural sciences they recommend that one afternoon per week be utilized for excursions into the open air, and they suggest the utilization of the free Saturdays for exercise in natural-science laboratories. They further recommend more extensive equipment of the schools with means of instruction, more drawing wherever possible, and not merely means of demonstration for the teacher, but also means for the exercise of the pupils. Special subcommittees present a methodical order of experiments, 57 for the instruction in physics and 100 for chemistry.

However, for all this teachers are necessary, and these are found in few schools. The committee of ten, and almost all its subcommittees, point to this great want and make recommendations for the preparation of suitable teachers. The committee on geography, which furnished the most extensive report, recommends a course very much in harmony with the new Herbartians (for instance, Frick), namely, to make geography a central branch and not to restrict it to a mere description of the surface of the earth, but include in it the elements of botany, zoology, astronomy, and meteorology, with all sorts of discussions concerning commerce, politics, ethnology, etc., and this commission submits a course like the one treated with us only in its first beginnings (compare W. Zopf, "The sum total of instruction in natural sciences for Prussian secondary schools of both kinds, Breslau, 1887"). The committee of ten designates these propositions as revolutionary, although as an ideal course which it is impossible to carry out everywhere and immediately.

We give about the same criticism to the reports concerning instruction in the sciences, including history. Some of the propositions betray that they are put forward by academic professors whose judgment is not guided by pedagogical experience; for instance, when we see that for botanical instruction in the elementary school it is proposed to furnish every pupil with at least a microscope, alcohol, glycerin, and iodine to aid his investigations of plants; or when we see the pupils of the senior high school class instructed to judge the authority of sources, especially the difference between real sources and representations at second hand; or when it is seriously recommended to allow the pupils of the same class in history to use two, three, or four parallel text-books for the purpose of accustoming them to comparison and criticism.

However, these little things do not detract from the value of the whole. The report of the committee of ten has for America the importance of an official pedagogy, scientifically progressive and professional, which will exercise an important influence upon the American school for a number of years.

And now to the committee of fifteen. For the purpose of continuing its reform propositions, the National Education Association in 1894 appointed another commission, this time of fifteen men, who should solve the same problem for the elementary school, and sketch the principles of municipal school management, and make suggestions for professional preparation of teachers. To facilitate the work, this commission was divided into three sections, each of five members. Following the example of the committee of ten, they put themselves in communication with all parts of the country by submitting a number of questions to many learned men and educators, and calling for expressions of opinion.

It is not necessary to enter into the reports on the two subjects mentioned last, however important they may be for America, since they are closely connected with public institutions differing from ours. It may be remarked though that the proposals for school management intend to serve reform by making the municipal school commissions independent of political influence by means of appointment instead of election. This will increase the independence and responsibility of the school superintendent. The last question, the one concerning preparation of teachers, is perhaps the most urgent one in the United States, but its solution finds the greatest difficulties in the prevailing social conditions, which will wreck the suggestions, however logical they may be. They are, that the general education of teachers, male and female, should be four years in advance of the course of the school in which they instruct; hence that elementary teachers should have graduated from the high school, and teachers of secondary schools have passed through college; besides, that both should have pursued a partly theoretical and partly practical course of pedagogy in a normal school.

More important by far is the first of the three problems, and the report concerning it has all the more interest to us, inasmuch as it is composed by Dr. Harris, the present Commissioner of Education. We have touched upon the report in previous pages.

Its peculiar importance may be found in the fact that it has caused a commotion in the educational world of America such as has never been witnessed before. The department of school superintendence had proposed the subject, "Correlation of studies in elementary schools." This term is of doubtful meaning—at any rate, its meaning is disputed in America—more so than with us the term "concentration in instruction," a term that is used with more different interpretations by our new Herbartians (Ziller, Stoy, Kern, Dillmann, Frick) than by Herbart himself, who meant it to be a connection of the entire instruction for systematic training of the soul of the pupil. In the department of superintendence, however (as is seen from the meeting of the department at Cleveland, February 19 to 21, 1895), it seemed to have been the intention to call for a report upon the different kinds of concentration and a general application of Herbartian principles to courses of study and methods of instruction. One is all the more induced to think so since not only the committee of ten, but also the subcommittees on history, geography, and natural sciences had expressed themselves quite in the sense of the new Herbartian school,

and had especially suggested a combination of related branches in instruction. They had not only used the expression "association," which was plain enough, but had also used the word "correlation." We quote from page 16: "While these nine conferences desire each their own subject to be brought into the course of elementary schools, they all agree that these different subjects should be correlated and associated one with another by the programme and by actual teaching; that every subject recommended for introduction into elementary and secondary schools should help every other, and that the teacher of each single subject should feel responsible for the advancement of the pupils in all subjects, and should distinctly contribute to this advancement." The report was expected to solve the same problem which Frick had attempted to solve in the meeting of principals of the Province of Saxony in the year 1883.

But Dr. Harris, on the whole, belongs to a conservative class of men. His scientific leaning is not so much toward the natural-scientific as it is toward the historic-philologic direction. The analysis of definitions forms with him the starting point of investigation, and in the development of his course for the elementary school he does not hesitate to go back to Charlemagne's trivium and quadrivium. He can not be counted among the representatives of the grammatical specialists, since he knows how to value a correct realistic instruction and does not try to make grammar a favorite factor in the so-called formal training. Yet he stands on the philologic side of the question, and regards language as the center of instruction in elementary schools. He may have been induced to emphasize this more particularly, since in public education in America the interest in natural sciences predominates, which may be seen from the fact that the pedagogical influence of Preyer finds much applause. We may also add that Dr. Harris is a Hegelian and, particularly in psychology, an opponent of Herbart. Finally, a misunderstanding added to the agitation, for he did not use the term "correlation of studies" in the sense in which it was used in the questions submitted. In short, he did not, as was expected by a number of educators, furnish an essay concerning the proper relation of branches in the course of study. In his fine and well-weighed manner he enters upon the order in which the branches should enter the course in harmony with the development of the pupil. He then explains more particularly what Stoy designates as "statics of instruction;" that is to say, the selection and amount which would promote an all-sided harmonious development of the mental powers and interests, and how a course of study should be framed to introduce the pupil into the totality of human knowledge of the present day, and prepare him for the practical demands of the world in which he is to live.

However well this may have been thought out, there is much abstract deduction without actuality in it. The kind of correlation of studies which many had thought of he merely touches by characterizing and rejecting the artificial combination of instruction in "Gesinnungs- und Kulturstufenstoff," rejected by the American Herbartians, as is done by our modern Herbartians in Germany, and he did it in referring to Ziller's example of Robinson Crusoe. To combat the perversity of artificial concentration was wise and proper, especially the mixing up of the branches of study, which is found in Germany here and there trumped up in model lessons in which essentials are torn apart and thrown aside in order to make excursions into other fields. But Dr. Harris not only neglected to point out the correct method of associa-

tion and concentration, but also failed to show the establishment of centers and unities within each branch of study by means of selection and grouping; nor did he touch upon the assistance of the various branches to one another by means of suitable reading matter and drawing; nor did he suggest a method of comprehensive relation of knowledge, but he provoked his opponents by placing his views, which are correct enough, to be sure, in direct contradistinction to the endeavors of the Herbartians. In place of concentration he advocated, especially for the beginning of instruction, the principle of analysis and isolation, so that everything individual and characteristic found in any branch of study should be clearly comprehended and become effective. While on the other side, in exaggeration of a correct idea, the study of the child's soul is made the basis of the whole science of pedagogy, Harris emphasizes sharply that it is not the psychology and the physiology of brain cells which determine the kind and extent of the branches taught, but the demands of the civilization in which the child is born, so that it be enabled to perform its duties in the family, in civil society, in state, and church. The method of instruction is to him a secondary consideration, and for external matters each science will suggest its own directions.

The consequence was that after the report was read in Cleveland February 19 to 21, 1895, the debate disclosed an almost universal and violent opposition. However, the study of educational questions, especially the Herbartian pedagogy in America, has received a stronger impetus than it would have received if the report had represented Herbart's views. According to information received from an American educator, there have never been such animated discussions in the educational world in America as at present. The United States, it is said, resembles a hotbed of pedagogical discussion, over which the gods must rejoice.

A GERMAN VIEW OF THE REPORT OF THE ENGLISH ROYAL COMMISSION ON SECONDARY EDUCATION.

The Annual Reports of the Commissioner of Education of 1894–95 and 1895–96 contained full accounts of the report of the English Royal Commission on secondary education, and quoted numerous noted English writers in reference to its origin and effect. The document proved of sufficient importance to arouse the attention of educators in both hemispheres, and it is instructive to see how this result of a thorough investigation, both in England and its colonies, and on the European continent, as well as in the United States, is reflected in the minds of German educators. The "Deutsche Zeitschrift für Ausländisches Unterrichtswesen" (a quarterly published in Leipzig and edited by Dr. J. Wychgram) contained in the second number of 1897 an authoritative German expression of opinion, which evidently views the English effort at reforming secondary education very impartially, yet critically. An English version of this article is offered here, with the hope that it may contribute to the comprehension of the report of the Royal Commission, and to gain an insight into the principles underlying governmental action in behalf of secondary schools in the

two countries, Germany and England. In some parts of this article it may be useful to refer to previous publications in the Annual Reports of the Commissioner of Education. (See pp. 583 to 713 of vol. 1, 1894–95.)

Dr. Otto W. Beyer, in the article mentioned, treats the famous document of nine volumes as a whole, and dwells preferably upon the underlying principles. He writes as follows:

The report of the commission on secondary education in England is undoubtedly one of the most, if not the most, important documents relative to school questions that have been published within the last decade of the development of secondary education in England. In cases of important issues it is a favorite mode of procedure of the English nation to appoint Parliamentary commissions for the investigation of far-reaching and particularly difficult subjects, and to endow them with unlimited power of requisition, so that the bare fact of presenting to the public a detailed report in nine volumes on secondary education in England is significant of English conditions.

Germany has nothing to offer in comparison. Without reflection, the report on the conference convoked by the Emperor in Berlin, December, 1890, might be suggested, but this publication can be only distantly compared to the English. From the outset the purpose defined was more limited and much less uninfluenced than that of the royal commission of England. The method of procedure and the membership were also entirely different; and in reality the German report lacks just those supplements which make the English report so valuable, to wit, the views in form of written opinions, and the stenographic accounts of testimony of every class of the public conversant with the subject, and the critical judgment passed on these opinions by the commission.

It is not our intention to offer a criticism on the value of the German report; we wish merely to state the fact that in Germany there exists no similar educational document. It is evident that Germans do not lay the same stress as the English do on public opinion, at least in matters pertaining to the learned professions. Whoever followed the important newspapers of England from the fall of 1895 till late in the following spring, during which time the battle of voluntary and board schools raged, will remember how contributions on this question poured in thick and fast, day by day, and will understand how the English Government would have ignored popular opinion had it overlooked the movements of public interest. In the discussion on the conditions of secondary education the Government may have felt the necessity of extra circumspection because of the important questions of material welfare at stake, and at the same time because of the close connection of these questions with the sympathies and antipathies of great and influential classes and with the weal or woe of numerous honorable institutions. In the present case the opinion of all parties concerned was greatly to be desired.

These facts were kept in view in forming the commission and when investing it with powers. The commission consisted of 17 members—learned professors, high ecclesiastics, Government officials, members of Parliament, representatives of university extension, and others, including three women, of whom two had received a doctor's degree at English universities. Consequently, the best educated and thoroughly impartial laity were commissioned with the investigation. The powers

granted by the Queen were unlimited. The commission was empowered to interview experts, examine books, documents, registers, reports, etc., and to adopt any other lawful means which it might deem serviceable to obtain a view of the state of affairs. Its field of investigation was secondary education in the broadest sense of the term—all authorities, central as well as local, occupied with education; all kinds of high schools, among them many on the border line between elementary and secondary schools; all kinds of teachers of high schools and their conditions; all kinds of school buildings, and, finally, all kinds of resources and their application. The report was laid before Parliament, which gave it the greatest possible publicity. The commission accomplished its work in 17 months, or 105 sessions. Many specialists were consulted, and when necessary auxiliary commissions, or subcommittees, were formed, consisting of both men and women.

The first of the nine volumes gives an account of the issues; it formed the basis for the statement of contents of the whole work. The second, third, and fourth volumes contain a verbatim report of the many opinions expressed on the different questions; the fifth volume contains notes of different specialists, as well as written answers to questions directed to individuals or corporations. Information is also given on secondary education abroad, as in the English colonies of Canada, Australia, New Zealand, and Tasmania, in the United States of America, in Austria-Hungary, Belgium, France, Bavaria, Hessia, Prussia, Saxony, Saxe-Weimar, Würtemberg, Holland, Spain, Sweden, Norway, and Switzerland. The sixth and seventh volumes contain the reports of the auxiliary commissions on the systems of secondary education in America and on conditions in countries which were regarded by the commission as typical of the development of secondary education in England. The eighth volume contains the summary and index of all the opinions of specialists, while the ninth volume closes the work with a large number of statistical tables.

Considering the report as a whole, we are at once confronted by the pleasing fact of the fund of common sense at the bottom. It is manifestly a very carefully prepared extract from all experiences and desires accumulated during the course of generations in widely different places under the most diversified conditions and under the greatest variety of influences. Its reflections are founded upon a manifold reality showing much individual life attended with great irregularity. On this broad foundation it certainly attempts—probably with too great care—to deduct generalities by a purely inductive method. Thus the report is also remarkable as being a typical evidence of the purely inductive English, we might say Baconian, mind resting firmly on a basis of a modest realism.

The Germans incline more to being deductive; but though it is our original title to fame and our strength and our pride in science, it may be questioned whether this marked tendency toward deductive reasoning may not have had too strong a theoretic influence on our school systems. The feeling that such is the case is widely spread in Germany, and was experienced by the Emperor when he convoked the conference in Berlin, December, 1890. As Brandi has rightly said in the Prussian Yearbooks (vol. 84, No. 2, p. 270), the first question with Germans is, "What do we want?" With the Englishmen it is, "What can we do?" We define our aim by what seems best; the English define theirs by what is attainable. The question is whether we, in determining what "seems" best, sufficiently consider the manifold and various conditions of practical life and their influence on school

education. The reserve of the English report gives us food for thought in this direction; the fact is repeatedly emphasized that few general rules should be laid down, as there is constant danger of treating too theoretically different necessities and entirely different degrees of capacity. "Uniformity" and "systems" of education the commission would abandon, displacing them under all circumstances by freedom, diversity, and expansiveness, advantages which have so often counterbalanced its deficiencies. For this reason the English are so patient with the multitudinous distinct forms of their educational system which are at times so difficult for us to understand. Up to a certain point it is believed that whatever exists is justified.

But the commission is not blind to the deficiencies of the English system of education. The chief evil of a lack of "coherence" and "correlation" in administration is properly appreciated; it could hardly fail to exist among four central authorities. The report mentions as a probable case that large sums of money may have been expended on buildings or other appurtenances which, if not altogether superfluous, have nevertheless not been sufficiently considered, or have been planned with respect to certain districts only, or to special purposes, whereas others should have received similar consideration. Besides, many plans generally conceded to be excellent could not be carried out, because of the uncertainty of receiving the money appropriated for the purpose by the law of 1890. The report emphasizes the immediate necessity of bringing about a change by means of legislation and the privy council. A special form of deficiency is the so-called overlapping of school districts, boundaries, and authorities.

Further fault is found in the misappropriation of endowments. It is to be distinctly understood that the newly to be appointed local school authorities are to be empowered with the regulation of spending endowment funds, and that their action is to be supported by the Government, even if old endowment statutes are violated in the interest of schools. As to what concerns the internal conditions of schools, it was found that pupils are kept in a state of dullness and indolence; the consequence is that as adults they do not seek to satisfy their desire for pleasure in the noblest way. The senseless so-called cramming for examinations is also deplored, as well the frequency of examinations, and the evil that hitherto one examining board seldom acknowledged the merits of the work of another. The commission maintains that there should be uniform examinations for the whole country. It has been found to be only too true that many schools do not accomplish proper results, and that many teachers are poor educators. The proposed means of reformation will be given later on.

On the other hand the merits of the English educational system receive due recognition. First among these are the wealth and multiplicity of individual forms of schools and the voluntary powers zealously devoted to secondary education. To avoid future interference with the multiplicity of distinct forms the commission does not favor laying down general rules for the establishment of secondary schools. It thinks that it should remain or become the duty of local school authorities to provide such schools in every district, as in conformity with public opinion, best meet local needs. For the same reason there should be no specified curriculum of study for the different types of schools.

The evidences of action among voluntary powers in behalf of secondary education are found in the existence of a large number of societies, independent of the State, which make a point of founding

and supporting schools. It is a great act of self-reliance to exert personal effort where there are no endowed schools. Some of these societies are stock companies, institutions for educational purposes little known in Germany. The large, even imposing, endowment funds, so frequent in England, are signs of the great interest manifested in the education of youth beyond the elementary stage. Such endowments for educational purposes are much more numerous in England than in Germany, but we must not forget that we, suffering from the effects of the thirty years' war, are not so rich a nation as the English, which was drawing in wealth from its colonies while our country was rent with the bloodiest and most disastrous war in the annals of history. The industrial development of England, moreover, began several generations earlier than ours, and private assistance had more occasion to extend a helping hand, as the State did nothing for education. The social evils of large cities also attained a higher degree of threatening danger much sooner than with us, and better education was regarded as a reformatory means. Many facts go to prove that in England the spirit of self-reliance is much older than with us—a consequence of the extended local self-government which England has enjoyed for many centuries. England is preeminently the country of social customs.

Further evidences of voluntary action are seen in university extension which, supported by the influence of the two ancient and rich universities of Cambridge and Oxford, for a long time developed without any State assistance. Very recently the Government has allowed appropriations for this enterprise. The whole movement plays an important part in England. The memoranda of the commission contains various entries respecting it. Even the two[1] independent institutes which the movement called to life, i. e., the university-extension colleges at Reading and Exeter, were called upon by the commission to furnish their data.

Another result of independent action is the establishment of a system of examinations for secondary schools without intervention from the State. Universities arranged examinations for preparatory and other secondary schools, originally out of necessity, because they had suffered the unpleasant experience of a constantly deteriorating preparatory education. The result of these private efforts has been that advanced education is controlled by the universities, a condition generally appreciated.

Compulsory attendance is not an immediate effect of State influence. School boards received permission from the Government to require compulsory attendance in their districts as they saw fit. Neither is school inspection founded upon State laws; it was introduced solely by ordinance.

As in weighing the merits and faults the commission showed a remarkable absence of prejudice, so a wise diplomacy is manifested in the measures they propose. Its uniform good will toward all secondary education is a mark of wise policy. Its earnest aspiration is to liberate the latent intellectual powers of youth, and to remove as many as possible of the obstacles in the way of their development. Necessarily the notable fact must have had influence that the universal competition threatening England in the field of industry, in which until recently it was the leader, makes a better appreciation of these powers a stern duty.

[1] More recently a third has been established.

Extraordinary caution is displayed in all proposed reforms, and great care is taken not to infringe upon time-honored principles of local self-government. The State is advised not to interfere when State interference is not positively necessary. The opinion held by the commission is that this principle has made the English great as a nation, and should be preserved. At the same time it is justified in apprehending that a contrary attitude of the Government would excite the people to too great an extent. In point of fact, nowhere outside of England has the controversy over the claims of State opinion against the rights of the individual (in itself the problem of all political development) been carried on with such tenacity of purpose and such whole-souled participation on the part of the individual. For this reason the commission considers it of paramount importance to combine the greatest simplicity with the least possible disturbance of exciting conditions. Therefore, it maintains that interference of authorities in general is permissible only to preserve present privileges and in cases of appropriations of public money, and possibly, also, inspection of sanitary conditions.

In pursuance of these opinions there is a given instance that where it is so desired private schools may refuse to submit to any State inspection except that of sanitary conditions. Even though the power of the State be unquestioned, a misuse of that power should be cautiously prevented. A highly estimable sense of justice is manifested in the report in the measures suggested against force employed to coerce minorities or individuals. The forbearance which the document recommends with inefficient private schools and poor teachers can be understood to proceed from a similar feeling. As a father does not willingly disown a wayward child, so the State should not relinquish the hope that inferior schools and incompetent teachers may improve by the example of their betters. Again, the commission shrinks from an attack on personal liberty. The creation of a monopoly for public schools by suppressing private schools is considered a step that might retard the progress of education. The duty of the law to educate the people is considered of higher importance than the immediate lessening of existing evils which, beyond a doubt, would vanish under stricter regulations against inefficient schools.

The commission seems to have forgotten that the children suffer when the State countenances poor schools and inefficient teachers. A seeming good will toward adults thereby leads to an indisputable injustice to minors. But if wrong in that case, the commission is decidedly right in placing a high estimate on the duty of the Government to educate the people. This alone explains its desire to invest with great power the local authorities newly to be appointed. A similar experiment has already been tried in the educational system of England; the Government at least sanctioned the policy of investing great power in local authorities. The county councils established in 1878, self-governing bodies originally vested with important judiciary power, but in nowise with special rights of school inspection, were allowed an annual appropriation of about $2,750,000 to be expended for the cause of technical education. The wide interpretation given by the law to the very term technical education enabled the councils to support not only technical education but a great part of secondary education in general.

It is no wonder that a body whose members have been elected for entirely different purposes from the development of secondary education should, in the beginning, misspend money. In the end, the

experiment was rather a costly one; but so rich a country as England holds its own even under dearly bought experiences that always have something of an educational character. It is not unlikely that the increasing experience of the councils in matters of secondary education in the meantime made the investment pay. At least there prevails a constantly growing belief that county councils have rendered useful service in developing secondary education, and the measure proposed by the royal commission of allowing them to elect the new local boards substantiates this. Continuity of development, which this measure protects in a field that can least bear violent agitation, must be provided for by a wise and precautionary government. It is not at all impossible that these local boards which can look back upon experience gained under adverse conditions will one day be the pride of the English educational system. The commission has especially prepared their berth with a tender love of preference.

It is furthermore significant that local school boards have very extensive powers of supervision, but only mild means of compulsion. An educational aim is thereby kept in view; the judgment of a citizen is spurred on to a voluntary acceptance of such sacrifices as the law can exact. To excite a lively local interest local school boards are permitted to superintend all affairs relative to secondary education—teachers, pupils, resources, and conditions of the schools. Within the limits of the law they shall have sovereign control in their sphere of action; they shall found and organize schools, maintain and supervise them; however, they must not directly oppose those to whom they owe their existence. They must act equally in contact with the central power and the people without any other intermediary whatever. The royal commission has intentionally left out of its recommendations the creation of an isolated provincial authority. Its opinion is that its functions should be divided between the central power and local authorities, and that a provincial authority would only occasion friction.

This is a strictly decentralizing measure; in fact, the commission has made every effort possible toward decentralization, as it is of the opinion that the intervention of the state in secondary education should be very limited, much more so than with us in Germany. It is disinclined to place secondary education entirely under public control, and considers the examinations and revisions prescribed for elementary education detrimental to secondary education. The commission is very skeptical respecting fixed courses of study; it looks for a remedy rather in the improvement of methods and a better preparation of teachers. In the present condition of normal schools, and with present methods of instruction in England, this is most apt to be the correct view.

We have already seen with how much caution the commission proposes innovations. In all cases it endeavors to make the best use of existing conditions with the least possible disturbance, and retains whatever of present usage is to any degree justifiable. With a strong partiality for conservative methods, it recommends that no new taxes be imposed, but that present incomes be distributed in conformity with the English principle to make the best of a thing. It agrees with Matthew Arnold, that the resources of secondary schools in England are immense if judiciously divided and properly applied. Therefore it insists upon a revision of regulations for endowments; therefore it maintains that the statute governing any endowment fund should not become in force until forty years after its establish-

ment; therefore it proposes that statutes referring to the expenditures of endowments, the interest of which exceeds $500, should be submitted to Parliament for approval; therefore it favors appropriate regulations for endowments in general. One of the main issues is that when any school has more income than it needs the tuition fee should not therefore be reduced for those students whose parents can easily pay, but that the general plane of instruction be elevated by means of this surplus; the latter should be expended for appurtenances, the usefulness of which is commonly acceded but for which parents are unwilling to pay extra charges.

Our consideration of the political aspects of the report would be incomplete were we to omit, in conclusion, its efforts toward equalization of the various institutions and its recommendation of the weaker schools to the economic protection of the State. It maintains that endowment funds should go toward the support of poor but talented students, recommends the employment of women in the field of secondary education as teachers, inspectresses, or members of local school boards, and upholds the rights of assistant teachers, especially by making an effort toward ameliorating their pecuniary position, which offers too great a contrast to that of the well-paid head teachers. A similar plan of action is adopted in its support of evening high schools. These should be supported wherever local needs demand it, and the tuition fee should be as low as possible. The commission is manifestly animated by the thought that any one who seeks evening instruction after a day's labor should in every way be encouraged, the more so as one in such a position requires further education for his own professional success. Mention must be here made of the commission's earnest, thoughtful care for rural districts. For a long time life in the agricultural districts of England has not been easy, and the commission justly remarks that, in the present deplorable condition of the oldest and greatest English industry, husbandry, every means should be devised to elevate the rural population. Every measure appropriate to leveling social distinctions and interesting the separate classes of teachers in one another for their common benefit and progress is considered beneficial to the profession and indirectly so to the State of which it forms a part.

The same remarks apply to Germany, where the different classes of teachers are kept apart by almost insurmountable barriers. In England affairs are not quite so bad. Each teacher there may rise to the highest professional dignity. From being the assistant to a village teacher, the lowest grade of the profession, an ambitious teacher may become a university student, and all schools are open to graduates in universities. Similar conditions prevail in Saxony, and perhaps in some other of the German States. Prussia is still averse to allowing teachers the possibility of unrestricted promotion. In England, however, not only teachers of elementary and secondary schools are in close contact, but the boundary lines between the schools themselves are not sharply drawn. It is a very characteristic fact that the commission does not advocate classifying of schools according to the kind of instruction or the amount of tuition fee charged. The view of the commission is that the true value of instruction, its vivifying influence on the pupil's mind, depends less upon the particular subjects taught than upon the inspiriting methods by which the mind is aroused.

Reviewing these reflections, we may, in conclusion, deduce the following results: The whole investigation of the condition of secondary education in England, which forms the subject of the report of the royal

commission, is distinguished by a careful consideration of public opinion manifested by the constitution of the commission, the selection of the persons interviewed, the critical review of their expressed opinions by the commission, and the unreserved authenticated publication of the results of the investigation. The report is a conspicuous testimony of English common sense. It is impartial in uncovering the faults and bringing out the advantages of secondary education as at present conducted in England, and shows wise diplomacy in its attitude toward the great object which it represents. It manifests a uniform good will toward all efforts for the improvement of secondary education, sanctions and even encourages local self-government on this subject, attaches great importance to making use of what is established as well as of transitionary movements, places a high estimate on the educational character of the law, enters even into the details of expenditures for the benefit of youth, favors the protection of the poorer classes, and advocates an equalization of social distinctions in reference to students as well as the teachers.

The lawgivers to whom this report is submitted are to be congratulated, and we may express the hope that, even after a first unfortunate attempt, a law for secondary education in England may in future be framed which will embody the spirit of the report of the royal commission.

MANUAL TRAINING IN GERMANY.

In no case has manual training been adopted by the authorities of any system of schools in Germany. Neither city nor provincial nor State authorities have recognized in manual training a study which deserves general introduction to the schools, except female handiwork, which is found everywhere as an integral part of the course of study for girls in elementary schools and in secondary schools for girls. Hence, wherever manual training is found in any school in Germany it is the result of private initiative. Private persons and societies, such as "societies for the promotion of practical education and handicraft," have established independent schools for that purpose or prevailed upon the municipal or State authorities to make a manual training department an annex to some elementary or secondary school of good repute. But while the officers of the regular school systems—elementary, secondary, and higher—refuse to introduce manual training, all the German educational authorities are engaged in promoting industrial, trade, and technical schools, both elementary and secondary. In the second part of last year's report a statement of the industrial schools in Germany is given which shows that the number of such schools is comparatively large.

The statistics here given are compiled from a recent German report.[1] In the absence of later statements, the general results shown must suffice. The total number of schools for manual training of boys in

[1] "The present condition of manual training in Germany, statistically represented by order of the German union for handicraft of boys," by Alban Förster, editorial secretary of the Royal Statistical Bureau of Saxony, Dresden, 1893.

1892 was 328, of which 126 were independent schools, while the others, 202, were connected with a variety of institutions, such as classical and modern high schools, normal schools, private elementary schools, orphan asylums, schools for the feeble-minded, deaf and dumb, and blind.

The agencies that maintain manual training are (*a*) special societies (50 schoools and 72 annexes), (*b*) municipal authorities (70 schools), (*c*) State authorities (66 annexes). Expressed in percentages: Societies maintain 38 per cent of these schools, municipal authorities 24 per cent, States 21 per cent, while private persons maintain 10 per cent, church congregations 2 per cent, others 5 per cent.

It is not practicable to give the date of establishment for every school enumerated, but the following statement may aid in gauging the progress of the movement:

Date of establishment of German manual-training schools.

Paper hanging		1	1		.5	.5
Blacksmith's work		1	1		.5	.5
Locksmith's work		1	1		.5	.5
Total	124	190	314			

The following table shows what part of the year is devoted to manual training:

Season devoted to manual training.

Schools.	Open during—				
	Whole year.	Winter.	Summer.	Failed to report.	Total.
Independent	100	22	.....	4	126
Per cent	82	18	.....	.....	100
Annexes	143	43	4	12	202
Per cent	75	23	2	.....	100
Total	243	65	4	16	328
Per cent	78	21	1	.....	100

The rates of tuition fees are indicated in the table below:

Semiannual tuition fees in German manual-training schools.

Schools.	Irregular.	1 to 3 marks.	4 to 5 marks.	6 marks.	7 to 10 marks.	12 marks.	18 to 20 marks.	Varying by grades.	Total.
Independent	42	20	4	25	12	9	5	4	126
Per cent	33	15	4	20	10	7	4	.....	100
Annexes	160	12	5	7	13	2	.....	12	202
Per cent	79	6	3	2	7	1	.....	.....	100
Total	202	32	9	32	25	11	5	16	328
Per cent	61	10	3	10	8	3	1	.....	100

NOTE.—The mark is equivalent to a quarter of a dollar United States money. Exact valuation, 23.8 cents in gold.

The following table gives the time each week devoted to work in manual-training schools in Germany:

Number of hours per week taught in German manual training schools.

Schools.	Hours.											
	1.	2.	3.	4.	5.	6.	7 to 10.	11 to 20.	Over 20.	Irregular time.	Not stated.	Total.
Independent	.....	62	15	37	.....	3	.....	.....	.....	5	4	126
Per cent	.....	51	12	30	.....	3	.....	.....	.....	4	.....	100
Annexes	4	56	16	55	5	19	9	8	2	11	17	202
Per cent	2	30	9	30	3	10	5	4	1	6	.....	100
Total	4	118	31	92	5	22	9	8	2	16	21	328
Per cent	1	38	10	30	2	7	3	3	1	5	.....	100

The subsidies for the encouragement of manual training and their sources appear in the next table, expressed in round numbers of marks nearest the exact sums:

Subsidies for German manual training schools.

Paid to—	By State governments.	By municipal governments.	Total.
Independent schools	25,000	40,000	65,000
Societies and private persons	23,000	17,000	40,000
Total	48,000	57,000	105,000

Hence it is seen that the total municipal and State aid for manual training (exclusive of tuition fees and expenditures defrayed by private persons and societies) amount to a little over $25,000. But it must be remembered that there are a great number of industrial, trade, and technical schools in Germany which teach handicrafts. These institutions are not counted in the foregoing statement.

RECENT GERMAN EDUCATIONAL LITERATURE.

The educational literature in Central Europe including only the German-speaking nations, the German Empire, Austria, and Switzerland, has been very copious in recent years. Treatises on the theory and history of education, text-books and guides, reprints of classical and modern writings on educational topics are counted by the thousands in one year. A few of these works, being of enduring value, are mentioned here, with a brief statement of their contents. No criticism is attempted or intended. The article of Mr. Scherer in this volume on the subject of "Currents in education" will supply the criticism. Mr. Scherer seems to be recognized in Germany as an educational authority, and in national conventions of teachers he is recognized as the man upon whose shoulders the mantle of Friedr. Dittes has fallen.

(1) "*Das gesamte Erziehungs- und Unterrichtswesen in den Ländern deutscher Zunge.*" Im Auftrage der Gesellschaft für deutsche Erziehungs- und Schulgeschichte, herausgegeben von Karl Kehrbach. Berlin, 1895.

This is a bibliographical list, with statement of contents of all books, essays, and governmental decrees or laws, issued monthly, concerning German education and pedagogical science. It contains also information of devices of teaching. The value of this new publication lies in the fact that it omits nothing of note. All the German educational journals are made to contribute to this work.

(2) "*Zeitschrift für Philosophie und Pädagogik,*" herausgegeben von O. Flügel und W. Rein. Langensalza.

This is a quarterly, representing, as far as education is concerned, the Herbartian school of pedagogy. Professor Rein, of Jena, is the educational editor. Thus far three volumes have appeared.

(3) "*Academische Revue,* Zeitschrift für das internationale Hochschulwesen," herausgegeben von Dr. Paul von Salvisberg. Munich.

This monthly discusses important university questions, and gives statistical news of the higher seats of learning of all the nations of the civilized world.

(4) "*Geschichte des Schul- und Bildungslebens im alten Freiburg,*" von Franz Heinemann. Freiburg.

This book may be considered a building stone for the future history of education. It gives the history of the educational efforts of a single city, beginning with the twelfth century. The author produces undeniable evidences for his statements in form of documents from the city archives. He closes his narration with the close of the sixteenth century.

(5) "*Pädagogische Schriften,*" von Joh. Friedrich Herbart, herausgegeben von Fr. Bartholomäi. Langensalza.

This is a new edition of Herbart's educational works, with explanatory remarks by the editor. Thus far only one volume has appeared.

(6) "*Sämmtliche Werke,*" von Joh. Friedrich Herbart, herausgegeben von G. Hartenstein. Band XIII. Leipzig.

This is the last volume of Herbart's work, and contains posthumous writings and other brief essays of Herbart not published before.

(7) "*Monumenta Germaniæ Pædagogica*," Vol. XVII, herausgegeben von Karl Kehrbach. Berlin.

This volume contains the history of military education in German-speaking nations.

(8) "*Heinrich Pestalozzi, 1746–1827.* Eine biographische Skizze," von O. Hunziker. Zürich.

The life of Pestalozzi is here described in six chapters by the custodian of the Swiss Pestalozzi museum.

(9) "*Vater Pestalozzi.*" Bilder aus seinem Leben, von Friedrich Polack. Bonn.

This is a popular little book designed to be used as supplementary reading matter.

(10) "*Grundzüge einer Sozialpædagogik und Sozialpolitik.*" von Karl Fischer. Eisenach.

The author attempts to show that both individual and social pedagogy is to a great extent determined and influenced by the science of biology: biology, in fact, is to him simply an enlarged pedagogy.

(11) "*Gewissen und Gewissensbildung,*" von Reinhold Seeberg. Erlangen.

The author starts out with the customary definition of conscience as the voice of God in man, and declares it useless. He concludes that it is moral consciousness.

(12) *Organisation und Lehrplan der mehrstufigen Volksschule* nach den Forderungen der Gegenwart, von Fr. Brüggemann. Berlin.

The author claims that no demands except those of the science of pedagogy should be heeded in framing the course of study of graded elementary schools. The common school as an organ of the social body must have an ethical ideal, in the service of which all instruction should be placed.

(13) *Organisation und Lehrplan der mehrstufigen Volksschule* nach den Forderungen der Gegenwart, von Wilhelm Reinke. Berlin.

This book is chiefly devoted to the organization and management of graded schools. It is a plea for adapting the common schools more and more to modern changed conditions of life.

(14) *Schule und Vaterland*, vaterländische Worte für Jung und Alt, von M. Evers. Barmen.

This is a collection of orations delivered at festive occasions.

(15) *Grundriss der Psychologie*, von Wilhelm Wundt. Leipzig.

Professor Külpe says of this book: "Psychology begins to descend from its lofty standpoint of exclusive scientific interest. A general desire for psychological information is noticeable. In the court rooms psychological processes are becoming quite numerous. In the literature of fiction a psychological tendency is seen, and in the State medical examination students in Germany have to undergo an ordeal in psychiatry. This proves the necessity of such a book as Wundt's."

(16) *Einführung der Pestalozzischen Methode in Preussen*, von Bruno Gebhardt. Berlin.

This work describes the efforts on the part of the Prussian Government, prompted by Queen Louise, to regenerate the people through public education after the battle of Jena. It shows the work of Wilhelm von Humboldt, the first minister of education in Prussia, and his able assistants, who popularized Pestalozzi's educational theories and methods.

(17) *Robinson als Stoff eines erziehenden Unterrichts*, von A. Pickel. Leipzig.

The author is a noted Herbartian. He gives preparations for lessons on Robinson Crusoe as central lessons in the development of the emotions (sittlicher Unterricht).

(18) *Die Willensfreiheit*, von Dr. Paul Michaelis, Berlin.

After an historical review over the most important attempt to solve the problem of freedom of the will, the author tries to show that the idea of "liberum arbi-

trium indifferentiæ" is untenable, and that there is neither in the physical nor in the Kantian metaphysical sense anything like a freedom of the will.

(19) *Psychologie mit Anwendung auf Erziehung und Schulpraxis*, von Dr. Jahn, Leipzig.

In normal schools psychology should not be treated as an abstract science, but as a practical school science. From examples taken from history and poetry, from observations and experiences in life and the schoolroom, the most important psychical phenomena and their laws are derived.

(20) *Kaufmännisches Fortbildungs-Schulwesen*, von Dr. Stegemann, Braunschweig.

Shows what is being done in Germany and other countries in regard to business education, and gives evidence of the rapid progress commercial schools are making everywhere, particularly in Germany. The book has been suggested by the boards of trade of the business centers of Germany.

(21) *Die Psychologie in ihrer Anwendung auf die Schulpraxis*, von B. Maass, Breslau.

Psychological phenomena are in this book shown in well-known examples taken from biblical history, from the reader, or from daily life. The book is intended for the use in normal schools.

(22) *Geschichte des gelehrten Unterrichts*, von Dr. Friedrich Paulsen, Berlin. Second edition.

The author has revised and greatly enlarged his work in this edition, and lays more stress upon recent developments of secondary and higher education in Germany. The book is a most thorough historical review of higher education known in the educational literature of any country.

(23) *Frauengestalten in der Geschichte der Pädagogik*, von Karl Supprian, Leipzig.

This is an attempt at showing what woman has done in the educational reforms of the nineteenth century. The author shows how women have influenced the education of the civilized nations, giving due credit to the men who originated ideas.

(24) *Das ästhetische Erziehungs-System*, von Dr. A. Wittstock, Leipzig.

A book in which the æsthetic side of education is emphasized, perhaps too urgently, but certainly with the best of intentions. The author defines æsthetics as the "science of emotions," and upon this ample definition he construes a system of teaching which will lead toward ennobling the human race.

(25) *Erziehungs und Unterrichtslehre für höhere Mädchenschulen*, von Dr. B. Ritter, Weimar.

The fact that the promoters of higher education of women in Germany claim a separate course of training for girls, one differing from that of boys in paying attention to the inevitable differences in sex, has led the author to write this handbook of pedagogy for girls. The book has found both warm commendation and adverse criticism in Germany.

(26) *Die Lebensanschauungen der grossen Denker*, von Rudolph Eucken, Leipzig. Second edition.

This standard work of the professor of Jena is materially changed in its second edition. It is a history of development of the problem of life from Plato to the present time, and will aid teachers in ascending to a higher level for the contemplation of life.

(27) *Die Pädagogik von Pestalozzi*, von H. Scherer, Leipzig.

This is the first volume of the work School Inspector Scherer speaks of in the article printed at the head of this chapter. It attempts to show education in its connection with the entire intellectual life of the German and other nations.

(28) *Die Geschichte der deutschen Universitäten*, von Georg Kaufmann, Stuttgart.

The first volume of this work appeared in 1888, the second in 1896. While the first gives the "Vorgeschichte," the second ends with the close of the Middle Ages. The work is frequently quoted in the European educational press.

(29) *Geschichte der Pädagogik*, von Karl von Raumer, Gütersloh. Fifth volume.

This is the fifth volume of Raumer's history of education, and contains the biographies of educators of the eighteenth and nineteenth centuries. This new volume is prepared by Dr. G. Lothholz, who faithfully continues Raumer's famous work.

(30) *Pädagogische und didactische Abhandlungen*, von Dr. O. Frick, Halle.

The former director of the Francke-Stiftungen, in Halle, published a number of essays, which are here collected in two volumes and published by his son, Dr. Georg Frick. These essays mostly refer to questions arising from the prominence Herbart's philosophy and pedagogy acquired in Germany during the last twenty years.

COMPARATIVE STATISTICS OF EDUCATION.

INTRODUCTION.

To state the actual conditions of education of a country for a given year in an array of numbers and well-arranged tables is doubtless a meritorious undertaking, but for the purpose of gaining valuable knowledge such a presentation is insufficient. The most fruitful sources of information are comparison and contrast. If, therefore, the absolute numbers are accompanied by ratios which allow a comparison of any separate item of information with others on a uniform scale, the presentation will be much better. Thus, for instance, it is well enough to know that a country has a certain number of teachers and pupils in attendance at school, but better it would be to accompany the actual number by a statement showing the ratio per hundred or thousand of the population. Or, if it were found that a State had a certain aggregate number of pupils in elementary and another in secondary schools, the statement would be greatly improved by showing that the first number amounts to 95 per cent, the second to 5 per cent, or whatever other ratio it would prove to be.

Still better would be the statements if they were given for a number of years, which would allow the computation of a ratio of progress. This would offer an unfailing standard of measurement for the progress of that country. For the statistician, however, such material would still appear isolated, and he would want to place the information of uniform character into line and compare various countries by a uniform standard of measurement.

There are very few items of educational statistics that can be subjected to a uniform standard of measurement. The educational institutions of different countries vary in scope and organization, so that uniformity in statistics can not be attained except, perhaps, in enrollment, attendance, and expenditures. These the annual reports of the Bureau of Education have published for several years. In the present article the final result of statistical surveys over a long period of years is presented. The greater part is the work of Prof. E. Mischler, of Strassburg, Germany. At the outset it must be stated that the statistics he offers are not in every case the most recent, owing to the fact that he desires to place the various countries as nearly on a level as he can, to apply a uniform standard.

The following summaries of the systems of education in the civilized world are intended to contain the most important data concerning institutions, teachers, and enrollment, derived from the statistics of a longer period than is commonly considered. These summaries are offered in the briefest possible form.

It has not in any case been possible to present the entire system of education, especially not with reference to secondary and special schools. Great gaps in the statistical structure here presented are noticeable. However, the data covering elementary schools are given, and in most cases those of university education also.

The statistical sources available are often very dissimilar, and they are not by any means the most copious and best where culture has reached the highest degree of development. It would seem as though the consciousness of success quenches the desire to review actual conditions.

The sources used for the present review are stated under the heading of each section. M. E. Levasseur's meritorious statistical work concerning elementary education (see Bulletin de l'Institut International de Statistique, tome VI, livr. 2, 1892) has been consulted frequently, because his statements rest for the most part upon direct authentic information.

These international comparative reviews are partly based on Levasseur's work, partly on the author's former compilations, and partly also on official sources. The translator substitutes later dates in a few instances when by so doing the author's object of placing the various nations on a level is not defeated.

I.—ELEMENTARY SCHOOLS.

Of the various categories of educational institutions few permit statistical comparison. They are chiefly those which agree in aims and objects to be attained, namely, the schools, variously called public, people's, primary, and elementary, and intended to give an elementary education to children of 6 or 7 to 12 or 14 years of age. In most countries advanced grades of elementary schools, such as grammar and burgher schools, are included in the generic term elementary schools. There are differences in the various countries in the method of teaching, and, to some extent, in the matter of instruction in these institutions, but for purposes of statistical comparision these internal differences may be left out of consideration, since they all serve the well-understood purpose of establishing an average measure of intellectual culture, the minimum of education requisite for the fulfillment of the duties of citizenship.

The following table presents first in absolute numbers the number of public schools, teachers, and pupils, with exclusion of all private institutions, except in a few cases.

TABLE 1.—*Number of schools (public elementary only), teachers, and pupils.*

Country.	Year.	Schools.	Teachers.	Pupils.
England	1890	19,498	45,434	4,341,364
Scotland	1890	3,076	7,745	664,466
Ireland	1880	8,251	(?)	507,865
Netherlands	1889	2,952	10,931	454,926
Belgium	1890	5,673	11,795	616,091
France	1890	67,859	106,247	4,405,543
Prussia	1886	34,016	70,522	5,005,116
Saxony	1889	2,205	10,102	578,794
Baden	1890	1,580	3,668	274,803
Bavaria	1890	7,141	a 23,376	834,829
Switzerland	1890	(?)	a 9,239	476,101
Austria	1893	17,619	a 43,708	a 2,872,929
Hungary	1889	a 16,702	a 21,738	a 2,015,612
Italy	1889	44,664	45,694	2,059,389
Sweden	1889	10,516	12,519	651,313
Norway	1888	6,282	4,906	259,239

a Including private schools and their teachers and pupils.

If we deduce relative values from the foregoing absolute numbers and other available sources as shown in the following tables, it will be seen that the differences between the countries mentioned is not very great, despite the divergences

in their school systems. Between 100 and 150 lies the average number of inhabitants provided with one school. Where the number deviates from the average peculiar circumstances prevail, as, for instance, in Great Britain (222) and in Scandinavia (owing to its ambulatory schools). Rarely are less than 50 and never more than 100 children assigned to one teacher, and the quota of pupils to every 1,000 inhabitants is generally between 120 and 170. But these averages are dependent upon the ages represented in each community, as well as upon the frequent or infrequent attendance of other than public schools.

TABLE 2.—*Numerical relation of elementary pupils to (a) schools, (b) teachers, and (c) the number of inhabitants.*

Country.	Year.	Number of pupils to—		
		One school.	One teacher.	Every 1,000 inhabitants.
England	1890	a 222	a 85	a 150
Scotland	1890	a 216	a 86	a 165
Ireland	1889	a 101	(?)	a 103
Netherlands	1889	152	42	143
Belgium	1890	a 109	a 53	100
France	1890	68	37	144
Prussia	1886	144	66	170
Saxony	1880	256	54	167
Baden	1890	172	74	163
Bavaria	1890	116	36	149
Switzerland	1890	(?)	(?)	a 168
Austria	1890	154	66	120
Hungary	1889	121	93	116
Italy	1889	43	41	75
Sweden	1889	a 62	a 52	140
Norway	1898	a 47	a 50	a 148

a Only public schools.

NOTE.—The results of Signor L. Bodio's calculations, published in his book "Di alcuni misuratori del movimento economico in Italia," show comparatively slight deviations from the foregoing table.

TABLE 3.—*Numerical relation of pupils to the number of inhabitants.*

Country.	Year.	Pupils in every 1,000 inhabitants.	
		In all elementary schools.	In public elementary schools only.
England	1889	(?)	154
Netherlands	1888	143	101
France	1887	145	116
Belgium	1889	(?)	109
Prussia	1886	178	176
Switzerland	1888	178	(?)
Austria	1889	125	(?)
Italy	1889	76	70
Spain	1885	96	83

TABLE 4.—*Expenditures for public elementary schools.*

Country.	Expressed in million francs.	Per capita of the population.		Per capita of pupils.	
		Francs.	Dollars.	Francs.	Dollars.
England	183	6.30	1.22	42	8.11
Ireland	23	4.89	.94	45	8.69
Netherlands	24	5.32	1.06	53	10.23
Belgium	27	4.50	.88	44	8.49
France	173	4.43	.85	39	7.53
Prussia	196	6.54	1.26	39	7.53
Saxony	23	6.57	1.27	40	7.72
Baden	7	4.37	.84	25	4.83
Bavaria	20	3.58	.69	(?)	(?)
Switzerland	19	6.48	1.25	40	7.72
Austria	103	4.48	.86	34	6.56
Hungary	37	2.12	.41	18	3.48
Italy	62	2.07	.40	30	5.79
Sweden	17	3.55	.69	26	5.02
Norway	3	1.61	.31	11	2.12

The expenditures for public school purposes range between 3½ and 6½ francs (67 cents and $1.25) per capita of the population, if we exclude the States in which the school system is not very extended, such as Norway, Italy, and Hungary. The following table shows in what proportion the communities, States (or provinces), and the national government contribute to the expenses of public elementary schools.

TABLE 5.—*Percentage of participation in defraying expenses for public elementary schools.*

Country.	Communities.	States or provinces.	Nation.
Netherlands	61	----	39
Belgium	55	6	39
France	41	11	48
Switzerland	70	----	30
Austria	61	38	1
Hungary	88	----	12
Italy	89	1	10

II.—NORMAL SCHOOLS.

The data collected in the two following tables on normal schools are made uniform as far as possible. Age of students and length of course are left out of consideration. A special feature of the preparation of teachers is the proportion of female students. It must be borne in mind that in some countries women are employed as teachers chiefly for special branches (female handiwork, drawing, girls' gymnastics), for which they receive no preparation in normal schools, hence the number of female normal school students does not show the same proportion

with the number of female teachers employed. The following tables give the absolute numbers and the ratios:

TABLE 6.—*Students in normal schools by sex.*

Country.	Year.	Males.	Females.	Total.	Ratios.	
					Males.	Females.
					Per cent.	*Per cent.*
Prussia	1892	10,133	*a* 1,500	11,133	85	15
Bavaria	1890	2,616	433	3,049	86	14
Wurtemberg	1892	823	64	887	92	8
Baden	1892	389	87	476	82	18
Austria	1892	6,723	3,896	10,619	63	37
Hungary	1886	2,579	1,033	3,612	71	29
Croatia	1884	179	154	333	54	46
Netherlands	1889	1,412	920	2,332	61	39
Belgium	1892	295	403	698	42	58
Sweden	1892	552	449	1,001	55	45
France	1887	1,709	1,118	2,827	60	40
Italy	1892	2,135	15,894	18,029	12	88
Finland	1890	*a* 200	*a* 200	400	50	50

a Approximately.

TABLE 7.—*Teachers in elementary schools by sex.* (*a*)

Country.	Year.	Males.	Females.	Total.	Ratios.	
					Males.	Females.
					Per cent.	*Per cent.*
Prussia	1888	58,702	6,848	65,550	90	10
Saxony	1893	8,642	544	9,186	94	6
Baden	1892	3,481	240	3,721	93	7
Austria	1892	31,704	16,781	48,485	65	35
Hungary	1889	21,356	3,289	24,645	87	13
Croatia	1884	1,388	531	1,919	72	28
Switzerland	1890	6,196	3,043	9,239	67	33
Netherlands	1889	11,250	3,942	15,192	74	26
Belgium	1890	6,627	5,168	11,795	56	44
Sweden	1892	5,486	8,549	14,035	39	61
Norway	1890	3,941	1,187	5,128	77	23
Scotland	1890	12,994	129	13,123	99	1
France	1890	65,312	86,538	151,850	43	57
Finland	1890	654	731	1,385	47	53

a These figures are not conclusive, since it must be remembered that many of the women teachers enumerated in column 3 teach special branches only and have no professional training as teachers, while the men are teachers in name and fact.

Statistics of secondary education must be omitted, since it is absolutely impossible to collect the numbers under uniform heads, the schools not being State institutions in many countries, and where they are so they are of such varieties that it would be manifestly unjust to classify them uniformly.

III.—HIGHER EDUCATION.

The various university calendars contain the number of students in the universities and show slight variations between those attending in summer and those in winter. The statistics are invariably obtained by direct communication with the questor or the secretary of these institutions. Hence they may claim absolute accuracy. Moreover, the possibility is given to compare from year to year the attendance and show the ratio of progress or retrogression. The following tables are obtained from the fourth volume of Minerva, Yearbook of the Learned World, Strassburg, 1895.

The efforts of the authorities in Italy to decrease the number of universities of that country have given rise to an animated discussion of attendance of universi-

ties and the cost of higher education. The minister of public instruction in Italy—Signor Martini—has added valuable material to this discussion.

TABLE 8.—*Number of matriculated students and hearers in winter of 1893–94.*

A. UNIVERSITIES.

Berlin (4,735 hearers)	8,343	Bologna	1,384	Klausenburg	644
Madrid (2,906 hearers)	5,867	Brussels	1,361	Zurich	625
Vienna (3,913 hearers)	4,856	Tokyo	1,342	Berne	617
Naples (4,732 hearers)	4,822	Prague (German)	1,316	Genf	598
Moscow	3,967	Pavia	1,247	Sidney	598
Budapest	3,892	Breslau	1,238	Giessen	541
Munich	3,408	Crakow	1,227	Groningen	540
Athens	3,331	Charkow	1,207	Basel	517
Oxford	3,232	Warsaw	1,176	Kiel	515
Leipzig	3,067	Dublin	1,151	Toronto	500
Edinburgh	3,064	Tübingen	1,151	Odessa	492
Manchester	3,000	Amsterdam	1,129	Messina	456
Cambridge	2,839	Lemberg	1,128	Agram	451
Prague (Bohemian)	2,722	Freiburg	1,117	Belgrade	442
St. Petersburg	2,675	Erlangen	1,107	Adelaide	433
Kiew	2,358	Strassburg	1,012	Rostock	420
Turin	2,239	Genoa	990	Lausanne	416
Glasgow	2,080	Leiden	990	Jassy	407
Barcelona	1,887	Heidelberg	960	Durham	400
Halle	1,859	Manila	925	Parma	372
Helsingfors	1,802	Aberdeen	912	Modena	354
Rome	1,752	Pisa	905	Czernowitz	316
Louvain	1,650	Marburg	837	Siena	236
Graz	1,578	Innsbrück	825	Perugia	226
Upsala	1,569	Göttingen	800	Freiburg (Switzerland)	196
Dorpat	1,555	Kasan	784	Cagliari	191
Bucharest	1,490	Melbourne	759	Camerino	144
Palermo	1,488	Greifswald	757	Sassari	139
Padua	1,474	Utrecht	750	St. Andrews	113
Liége	1,470	Catania	748	Ferrara	95
Christiana	1,450	Lund	688	Amsterdam	93
Bonn	1,442	Jena	682	Urbino	93
Würzburg	1,442	Ghent	672		
Coimbra	1,439	Konigsberg	658		

The foregoing numbers offer an opportunity to find the proportion of the number of universities to the population, and this is the order:

Country.	Proportion.		Country.	Proportion.	
	Universities.	Inhabitants.		Universities.	Inhabitants.
Russia	1	12,300,000	Denmark	1	2,100,000
Hungary	1	5,000,000	Spain	1	1,760,000
Portugal	1	4,800,000	Sweden	1	1,750,000
England	1	4,140,000	Norway	1	1,750,000
Bulgaria	1	3,200,000	Ireland	1	1,670,000
Austria	1	2,800,000	Belgium	1	1,500,000
Greece	1	2,800,000	Italy *a*	1	1,430,000
Roumania	1	2,800,000	Netherlands	1	1,120,000
Germany	1	2,470,000	Scotland	1	1,000,000
Servia	1	2,100,000	Switzerland	1	540,000

a If the 4 free universities are not counted, the ratio is 1,770,000.

In the following comparison isolated faculties as they are found in Hungary are disregarded, while those of France are counted, in order to obtain numbers comparable with those of other countries. The university college at Dundee, Scotland, is not counted, while for Ireland 3 universities are counted. For Germany the academy at Münster is not counted; but on the other hand the legal faculties that constitute the universities of Macerata, Italy, and Oviedo, in Spain, are included. For France 15 universities are counted, according to more external considerations.

(For statistics of higher education in the United States the reader is referred to special statistical tables found in this annual report.)

The number of universities, it must be said, is not a good standard measurement for the extent of higher education. The number of students is indeed the

better measurement. In taking this latter number, however, it should be carefully considered that in every case both the matriculated students and the hearers are included, because if that deduction were made in Germany, where the distinction between matriculated students and hearers is sharply maintained, it would be an injustice to that country, because in other States the distinction is not made in the statistics of attendance. Again, it may be concluded that among the hearers there are many foreigners, and hence the differences may be equalized by counting in all the students. With these reservations and explanations the following proportions are found:

Country.	Proportion.		Country.	Proportion.	
	University students.	Inhabitants.		University students.	Inhabitants.
England	1	1,512	Austria	1	1,722
Germany	1	1,580	Italy	1	1,756
France	1	1,083	Hungary	1	3,600

The numerous colleges, academies, detached faculties, independent faculties, and mere examination universities or boards are found in the following table:

TABLE 9.—*Number of students in French "facultés," colleges, and academies in winter of 1893-94.*

1. FRENCH "FACULTÉS."

Paris	10,164	Rennes	971	Algier	406
Bordeaux	1,974	Poitiers	851	Dijon	368
Lyons	1,812	Nancy	738	Besançon	224
Toulouse	1,347	Caen	598	Clermont	189
Montpellier	1,315	Aix	581		
Lille	1,118	Grenoble	511		

2. EXAMINATION BOARDS.

Madras	7,906	Calcutta	5,308	Bombay	1,661
London	6,000	Allahabad	2,075	Lahore	839

3. COLLEGES, ACADEMIES, AND INDEPENDENT FACULTIES.

Nottingham, college	1,902	Jaroslawl, lyceum	203
London, university college	1,500	Kiew, theological academy	177
Edinburgh, medical school	1,000	Cardiff, college	170
Petersburg, medical school	742	Stockholm, university	160
Birmingham, college	700	Macerata, law faculty	153
Bristol, college	482	Lampeter, college	135

Oviedo, law faculty	222	Gothenburg, university	45
Sheffield, college	211	Braunsberg, theological lyceum	41

NOTE.—The secondary schools in the various countries show so great a variety or classification that a comparison such as is shown for elementary and higher education is impossible.

CHAPTER VI.

COMMERCIAL EDUCATION IN EUROPE.

CONTENTS.—Commercial schools in Germany, Austria, England, Switzerland, France, Belgium, and Italy; their history and present status.

IN GERMANY, AUSTRIA, ENGLAND, SWITZERLAND, FRANCE, BELGIUM, AND ITALY.

An article on "Industrial education in Germany" contained in last report of this Bureau (see p. 1215, Vol. 2, Annual Report of 1895–96) shows what efforts Germany and other German-speaking nations are making in preparing young men and women for skilled labor, art, and technical pursuits, in order successfully to compete with other nations in building up a remunerative industry, and in gaining the markets of the world for their products. Naturally the commercial schools were mentioned incidentally. Statistics of such schools were given, without, however, attempting an exhaustive statement of their organization, courses of study, and management; nor can this be done now without a description of some of the 247 commercial institutions of secondary or elementary character, owing to existing diversity, an attempt which would be beyond the scope of this office. Teachers who are interested in this will find the desired information in a book written by Prof. Edmund J. James, entitled Education of Business Men in Europe,[1] and in a German publication entitled "Kaufmännisches Fortbildungsschulwesen," by Dr. Stegemann, in Braunschweig.

In the latter-named book, published in 1896, a description of each commercial school in Germany is given with a minute statement of the course of study and other details. The book is the result of an inquiry of the boards of trade of the most prominent commercial and industrial cities of the Empire. The editor regrets that few of these schools agree in their courses of study, but he seems to overlook the fact that each community has individual needs which, to a certain extent, determine the branches of study in both the industrial and the commercial institutions.

Commercial education—that is, a special training for young men[2]

[1] Reprinted in the Report of this office for 1895–6, Vol. 1, pp. 721–838.

[2] It has not been found desirable in Germany to invite women to prepare themselves for mercantile pursuits, although for service in the countinghouse, for shorthand and typewriting, they are frequently employed.

who intend to devote themselves to commercial pursuits—has a comparatively brief history, and the system, if we may speak of a system, has not reached that degree of perfection which is found in other departments of public education. It may be said to be still in its infancy. The Germans are quite aware of this, and, situated as they are in the center of Europe, they look about themselves to note what other nations have done and are doing. It is a characteristic feature of the Germans that for whatever they undertake they prepare a long way ahead. They are not impulsive reformers, but proceed systematically upon the basis of what exists, changing it as times and conditions of life demand. At present the various governments of the 26 States that constitute the German Empire are employed in improving and extending their agricultural, industrial, and commercial schools to enable the people to compete with their neighbors in the world's market.

An Englishman, Sir Philip Magnus, in a work on industrial education, expresses himself on this point with felicitous frankness. He says:

The commissioners tell us that the increasing severity of the competition, both in our home and in neutral markets, is especially noticeable in the case of Germany, and in every quarter of the world the perseverance and enterprise of the Germans are making themselves felt. In the actual production of commodities we have few, if any, advantages over them, and in the knowledge of the markets of the world, the desire to accommodate all local tastes and idiosyncrasies, a determination to obtain a footing wherever they can and the tenacity in retaining it, they appear to be gaining ground upon us.

This advance of German trade does not appear to be owing to any falling off in the efficiency of the British workmen, but solely to the superior fitness of the Germans, due exclusively to the more systematic training they receive for mercantile pursuits. The commissioners tell us that while in respect to certain classes of products the reputation of our workmanship does not stand as high as it formerly did, those who have had personal experience of the comparative efficiency of labor carried on under the conditions which prevail in England and foreign countries appear to incline to the view that the English workman, notwithstanding his shorter hours and higher wages, is to be preferred. They further state that in the matter of education we seem to be particularly deficient as compared with some of our foreign competitors, and this remark applies not only to what is called "technical education," but to the ordinary commercial education which is required in mercantile houses, and especially the knowledge of foreign languages.

The recommendation of the commissioners that Her Majesty's consular and diplomatic officers should be instructed to report any information which appears to them of interest as soon as they obtain it, and that it should be as promptly published at home when received, has resulted in the publication of a series of reports which fully bear out the conclusion at which the commissioners have arrived in regard to the deficiencies of our commercial education; to the activity displayed by persons in the search of new markets, and the readiness of manufacturers abroad to accommodate their products to local tastes and peculiarities. In several of these reports attention has been called to the importance of possessing an army of commercially trained agents, who are able to discover foreign markets, to inform English manufacturers in regard to the requirements of these markets, and to follow the style of homemade goods.

In order to see how it is made possible for German merchants to "storm the foreign markets," it may be well to look at a course of study designed for commercial training. It is a course in vogue in the higher mercantile institutions in Germany and Austria. The branches are those of a one year's course: Foreign languages (English, French, and Italian), political economy, commercial law, commercial geography and statistics, bookkeeping, commercial and political arithmetic, knowledge of international commerce, and knowledge of merchandise. The last two subjects bear particularly upon the question at issue between England and Germany, and because they are of more than passing interest to American readers they may here be stated in detail.

Knowledge of international commerce.—The object of the lectures on this subject is to give the student a concept of the world's commerce, and to equip him with such knowledge as is necessary to successfully engage in international trade.

In these lectures are treated:

The origin of the produce exchange; its divisions and organization; the brokers and their position on the exchange; legitimate commercial transactions on the exchange, and exchange boards of arbitration.

The legal regulation of a system of weights and measures; the metric, English, Russian, and Chinese systems of weights and measures with special regard to their position in the world's commerce; the system of weights and measures of the Orient.

The method used to determine quality in the international grain trade; method of determining quality of yarn and silk in international commerce (numbering yarn and silk titration); alcoholometry and number measuring (dozen, score, etc).

The systems of money of those European countries through which balances with transmarine countries are mainly adjusted; in addition, the state of the money standards, bills, and currency quotations in North, Central, and South American markets; also the Eastern Asiatic and Australian markets, and, finally, the money standard in the Orient.

The transportation of goods by railroads and rivers, considering the traffic rules; the railroad fares and freight rates; classification of freight in Austria-Hungary, Germany, and France; international tariff associations; international service, together with the necessary documents.

Ocean transportation of freight, subdivided into registering, classifying, and measuring ocean vessels; the manifest; the book of cargo and the bill of lading; letter of conveyance; charter party; tonnage; fixing freight rates; the most important steamship companies, their lines and fares; marine freight insurance.

The price quotations of the most important articles of commerce (grain, flour, spirits, petroleum, cotton, coffee, sugar) on the world's market, together with the usages in vogue for cash and time sales. Explanation and computation of equivalent prices, and the construction of equivalent price tables.

The explanation of the settlement of balances by exports and imports, to be illustrated by a series of examples taken from actual transactions. (The basis of these lessons is a book by Dr. Sonndorfer, "Die Technik des Welthandels," Handbuch der Internationalen Handelskunde. Vienna.)

Knowledge of merchandise.—On the basis of the advanced preparatory study of the natural sciences, and after introductory remarks (system, methods of investigation, microscopy, polarimetry, structural arrangement of organic, vegetable, and animal substance) from the purely commercial standpoint, the products of the world's market are considered according to their natural history and physical and

chemical characteristics. After being classified their external and internal marks of genuineness and their adulteration and substitutes are considered. After this preparation the entire animal, mineral, and vegetable products are separated into their organic branches and discussed; but certain home articles of export and import are given special attention (groceries, foods, luxuries, drugs, raw materials, manufactures of textile industries, and tanneries), besides inorganic products technically applied (coal, petroleum, and metals).

In addition special instruction on the adulteration of food and its detection is given.

Training in the use of the microscope.—Microscopical tests are thoroughly carried out for determining raw material and manufactures. The material for these microscopical examinations is taken from the collection of products and from objects sent to the school by merchants. To aid in the demonstrations and practical exercises, there are (*a*) a special laboratory for the study of merchandise, with a sample collection for direct use during the teaching, (*b*) a museum of merchandise, and (*c*) a professional library.

Insurance.—Insurance in general, insurance companies, mutual and stock companies, granting of charters to them, the State's control of them, laws relating to insurance, and fees to the State; insurance against damage; transportation, fire, hail, and animal insurance, also reinsurance; life insurance, insurance payable at death or at certain age; mutual insurance against sickness or helplessness and accident; computing the premium, the reserve, redemption, loans, policies, and reductions; the insurance business in its practical workings, closing accounts, (profit, loss, and balance sheets).

It is no wonder that commercial agents thus prepared can go into foreign countries and open up the markets for German goods. They speak to the people in their own tongues, adapt their consignments to the special wishes of the purchasers, with regard to both the quality of the goods and the manner of their packing, and with tenacity keep open a market where they have once gained a foothold. The foregoing abstract from a German course of study proves incontrovertibly that preparation is the secret of success in commercial affairs as it is in art and industry.

In searching for material which would demonstrate to the American reader what European nations are doing in commercial schools, a pamphlet on the subject was found of much service, written by Prof. Ludwig Fleischner in Budweis, Bohemia, Austria, who treats the subject in a way which will commend itself to the interested reader. He shows what the people in England, France, Austria, Italy, Belgium, and Switzerland are doing in the preparation of commercial men, and he incidentally offers comparisons which may prove helpful in this country. He says in introducing his survey here given entire with the exception of a few paragraphs:

The immense progress the natural sciences, technology, and transportation have made in recent years has given to the commercial profession an importance which could not be foreseen in former years. More than ever before has it become the merchant's duty to act as middleman between producer and consumer. In ever-widening circles he has to bring the products of agriculture and industry to their proper markets. By means of increased taxation which commercial enterprises are subject to they support ever more strongly the State

in the discharge of its civilizing efforts. Direct exchange between producer and consumer has almost wholly ceased, and the percentage of the population devoted to commercial pursuits has increased considerably in every civilized country.

Moved by these considerations several European governments have of late years bestowed much attention upon commercial training of young men, and the results thus far obtained give assurance that the further development of schools for that purpose will be commensurate with the demands of the times. Hitherto other professions have been aided by the State, through the establishment and liberal support of institutions of all kinds, while the commercial branch, despite its importance for political economy and public welfare, had received no worthy representation in the educational system of the various European States. Hence it was resolved, as far as available means allowed, to subsidize communities, boards of trade, commercial societies, and other interested bodies which contemplated establishing commercial schools or had done so already.

AUSTRIA.

A brief historic view of the development of the commercial-school system in Austria is not without interest in our country, where such institutions are struggling to rise to a higher plane of usefulness.

The classical high schools in Austria, founded during the Middle Ages and also during the reign of Marie Theresa, did not offer proper instruction to young men intending to devote their lives to commercial pursuits, and, despite the praiseworthy efforts of the Queen in favor of secondary education, the merchants' best preparation was found in the countinghouse and store magazines. In 1762 a few courses of lectures on commercial arithmetic, discount, bookkeeping, and science of government were opened in high schools, which courses were conducted by "piarists" (members of a religious order), and later by civil officers; and in 1763 a course of lectures on financial science was opened in the University of Vienna, with which Joseph von Sonnenfels was intrusted. But these measures did not suffice for the wants of commercial men, since both the high schools and the university had the avowed purpose of preparing civil officers for financial and administrative offices.

In the year 1769 purely commercial training began in consequence of a "manifesto" of the supreme commercial authority of the Empire, the Board of Trade of Vienna, which document pointed out frankly that the preparation of merchants had heretofore received inadequate attention. In 1770 a State institution for the preparation of merchants was opened under the name "Commercial Academy." It received an annual subsidy of 3,000 florins (about $1,500). The institution had two grades of one year each, in which arithmetic, ethics, grammar (and rhetoric), geography, calligraphy, drawing, accounting, commercial science, geometry, natural science, double-entry bookkeeping, and French and Italian were taught. Financial difficulties prevented a vigorous development of the school, which, nevertheless, kept alive as a State institution for over thirty years. In 1804 the school was reorganized and classified among the newly established modern high schools (Real-Anstalten, socalled in contradistinction to classical schools), but in 1815 it again assumed a purely commercial character as a department of the new polytechnic institute, the foundation of

which had been suggested, if not demanded, by a sudden development of commerce and industry in Austria soon after the Napoleonic period.

A further step is worthy of note. In 1852 a number of "Real-Anstalten" (modern high schools) were established by private enterprise, and the one which had hitherto acted as preparatory school for the commercial academy severed its connection with the polytechnicum. The academy thereafter admitted only graduates of "Real-Anstalten," whereby the attendance was greatly diminished. In 1865 the institution had to be abandoned, being superseded by the Vienna City Commercial Academy, which had the identical purpose of the former State institution, while the polytechnicum was raised to the rank of a university, with whose aims, equipment, and methods a commercial course was not thought to be in harmony. But as early as 1840 a Johann Geyer had opened a private institution which was imitated in the principal cities of the country. Other commercial schools of lower order, partly founded by stock companies, partly by private enterprise, have since come into existence and proved to be an important factor in the Austrian educational system.

Legislation also has frequently been attempted in the organization of commercial schools. An important legislative regulation is found in the law of November 20, 1868, for Lower Austria concerning the establishment and maintenance of industrial supplementary schools. According to this law the industrial and commercial schools are subject to the legislature of the crownland, while in other parts of the Austrian Empire they are subject to regulations issued by the minister of public education. A ministerial order of May 14, 1870, refers to the examination of teachers in commercial schools. In February, 1872, an inquiry into the organization of commercial schools was instituted, resulting in a conference which submitted material for a bill which became law February 23, 1873. This law divides all the secondary commercial schools of Austria into public and private, higher and lower schools. A ministerial order of May, 1884, changed the regulations concerning the examination of teachers, and another, dated September 25, 1892, refers to teachers in the lower schools. According to these regulations two kinds of commercial schools, to wit, schools of two and of three year courses were recognized as lower and higher schools, the latter being called commercial academies. A special board for the examination of teachers in commercial schools and academies was appointed for Austria, which board has its seat in Vienna.

By means of these regulations a sharply defined boundary line has been established between the schools of two-year courses and the academies of three-year courses. Special attention is bestowed by the Government upon these lower schools, they being much more numerous than the academies. It must be explained, though, that the difference of one year in the length of the course is not the only reason for calling the one kind of schools lower and the other higher institutions, but pupils of 13 or 14 years of age may enter a lower school with only elementary preparation, while admission to an academy presupposes graduation from a secondary school; hence the entire course of the three-year institutions is of a higher kind. The minister of education, in recommending the passage of the law of 1892, said:

> To bring about the establishment and extension of the system of schools with a two-years' course is a necessity, since commercial clerks have not hitherto been prepared professionally to an extent commensurate with the needs of the commercial world. Hence, wherever communities, boards of trade, and commercial

societies find suitable occasion for opening such schools, the State should do all in its power to aid them in their laudable efforts.

The Austrian Government has done much in aiding the movement with both advice and material support. The best measure seems to have been the appointment of imperial inspectors for commercial schools, who watch over their pedagogic and didactic development. A normal plan of study has given this class of schools a firm foundation, because it was framed according to the needs of the great mass of people, with elasticity enough to meet local demands. This course lays especial stress upon instruction in the mother tongue and modern foreign languages. Furthermore, in order to aid the founders of such schools in their work of organizing and to secure for them a material basis of funds, the minister of public instruction published an organization statute, according to which all the commercial schools of recent origin have been established. The same authority undertook the publishing of a series of uniform text-books, and secured an annual appropriation of 68,000 florins ($34,000) from State funds for the support of commercial schools.

It seems worthy of mention that at present the State is urged strongly by commercial men to establish more higher commercial schools and support them exclusively from State funds. It is argued that the State provides higher industrial, agricultural, forestry, and mining academies for leaders in industry, agriculture, forestry, and mining, while for the mercantile branch no State institution exists. The merchants feel that the education of their assistants is not of such a high order as that of the members of other callings, and they attribute it to the want of institutions of a high order. At present the commercial branch is entirely dependent for the best preparation of its members upon higher schools established by local authority or private enterprise—institutions which charge high tuition fees; hence are attended by wealthy young men only. This opinion found expression in the legislature. During the debate on the educational budget March 8, 1894, Deputy Dr. Hallwich expressed regret that commercial training had as yet received no adequate State support. Of the merchant, he urged, much greater demands are made than formerly, owing to freer commercial movement all over the civilized world, and it would therefore be wise if the State authorities paid more attention to proper preparation of men who might become leaders in commerce, as the State prepares leaders in every other field of human exertion. The speaker recommended this matter to the attention and special care of the Government.

The latest action in this matter was taken by the board of trade and industries in Vienna, and followed a suggestion made by the Vienna society for mercantile interests, to the effect that the Crown ministers be informed of the inadequacy of State support for commercial training. In order to bring about a relief of the overcrowded Vienna Commercial Academy, the board of trade recommended the establishment of several parallel institutions in Vienna. These schools should be so located as to accommodate the students in other parts of the city; they should be granted the same privilege regarding the voluntary (one year's) service in the army, and should be prohibited from charging higher tuition fees than other State secondary schools. The board of trade further expressed the opinion that besides these commercial academies in Vienna, the State should either establish or liberally subsidize a sufficient number of lower commercial schools (of two years' course). Such schools had proved very serviceable to pre-

pare well-trained merchants, and if more were established they might aid in relieving the overcrowded condition of the Vienna academy. The board expressed the hope that the State would establish at least one higher institution of the kind proposed, which might act as a model for the whole country. Lastly, the board proposed that a State organization be called into existence which would induce cooperative action by the many mercantile societies and boards of trade, an organization whose advice should be solicited on all questions concerning the commercial schools of the State.

In 1896 Austria (without Hungary) had—

15 higher commercial institutions (called academies).
20 secondary commercial schools.
6 private commercial institutions, partly secondary and partly elementary.
62 elementary commercial schools and
18 commercial schools connected with other institutions.

In the nature of the case the youngest institutions have still the frailty of infancy, but the tendency of the time and the immense extension of commerce, both inland and international, will strengthen them. The question of technical preparation for commercial pursuits in Austria has been in the hands of well-meaning experts, and it is to be hoped that the reorganization of the system and its adequate expansion will form another chapter of the educational system of which Austria has reason to be proud. A characteristic feature of the commercial institutions of learning in Austria is that they stand upon the solid basis of experience and attempt to meet the just demands of the time. In their organization, course of study, and training they are practical. They do not consider it a fault, but a virtue, in this period of the division of labor, to eliminate all matters not distinctly mercantile and to bestow their attention chiefly upon languages and commercial sciences; in short, upon subjects which are of importance to our present civilization and the calling for which these schools are designed. It will take time to offer for admission candidates with appropriate preparation, i. e., young people who early in life have been destined for commerce, and not those who land in the harbor of a commercial school after having failed in a classical high school. There are too many students yet who enter commercial schools because of insufficient talent or diligence to master the studies prescribed as the preparation for university work. The greater the interest which merchants show in these schools the better will be the students offered for admission.

To complete the survey of Austria it may be stated that in Hungary also new regulations have been issued lately concerning high commercial schools. As in Austria, the authorities in Hungary insist upon graduation from a modern high school (Real-Anstalt) as a condition of admission to a commercial academy, and prescribe a three years' course. The languages taught are Hungarian, German, French (or Italian or English). Aside from languages and common branches, the following studies are taught: Knowledge of merchandise, chemical technology, political and commercial arithmetic, counting-house practice, bookkeeping, correspondence, political economy, and commercial law. The authorities which supervise these schools are the crown ministers of commerce and of public instruction. These authorities send deputies to the graduation examinations, and State inspectors appointed by the minister of public instruction visit these schools at intervals.

ENGLAND.

England has for centuries enjoyed the glory of being the foremost commercial country in the world. It is astonishing, therefore, from the standpoint of continental Europe, to notice that for commercial training of young men the Government in England does less than in any other country. If private enterprise, corporations, and commercial clubs had not taken care of commercial education by establishing appropriate courses in a few secondary schools, primarily founded for other purposes, one would think England had no scholastic commercial training. In this respect Austria, France, and Germany do much more.

A comparison of the English school system with those of the three countries just named will explain this singular deficiency. Before 1850 the Government of Great Britain did not concern itself with public education. Since the Middle Ages the principle has prevailed in the British Isles that the State as such had no more right to interfere in the educational affairs of the people than the people had a duty to tolerate such interference. Even now, after several decades of State education, compulsory attendance is left to local option. In the classical land of self-help and self-dependence schools and other educational institutions of the most varied types originate in private initiative, and only within the last generation has legislation changed and the old principle been abandoned.

At the head of those interested in the promotion of commercial training stands the London Chamber of Commerce, in consequence of whose urgent appeals there has been great activity in behalf of commercial education, and a uniform organization of schools for that purpose has resulted therefrom. A report of Sir John Lubbock proposed, in 1887, a uniform scheme of study for the various commercial courses existing in secondary schools. The London chamber adopted the essential features of Sir John Lubbock's plan by issuing a uniform course of study, which, however, the Government was unable to adopt, owing to its want of jurisdiction in secondary schools; hence the course had to rely upon the initiative of the various chambers of commerce in the large cities of the Kingdom. The support given to it is an indirect one. It consists in this: That the merchants belonging to the chambers of commerce agree to engage as assistants and clerks only those who have had the preparation prescribed in the course mentioned, or at least to give preference to applicants who can prove such a preparation. This course was framed by a committee of the London Chamber of Commerce and adopted by the chamber December 14, 1887. It consists of a "junior course," designed for boys 10 to 16 years old, and a "senior course," for boys over 16. The instruction in the various branches prescribed is to be fashioned to suit the age of the pupil, and the whole time devoted to it must cover a period of six years.

However, a cursory examination of this course of study plainly shows that the Englishmen have not arrived at the same estimate of a thorough commercial instruction prevailing in continental Europe, although the chamber had consulted French and German models in framing the course, to wit, the "plan d'études de l'enseignement special" in vogue in France, and the programmes of the commercial schools in Munich and Leipzig. The English course contains subjects the especial profit and value of which for future merchants is not clearly seen, and, on the other hand, it does not contain studies which

seem indispensable for commercial pursuits. For instance, in the course for the second year (for boys of 11 to 13 years of age) we find drawing (two hours a week), free-hand, shaded construction of geometrical figures and simple objects of daily use, geometrical drawing according to measure, sketching, and india-ink shading. In the third year (for boys of 12 to 14 years) we find drawing (two hours a week), shade projection of cubes, spheres, leaves, and architectural fragments; elements of architectural drawing. These subjects seem out of place in a commercial school, says Professor Fleischner. On the other hand, we miss in the course such subjects as cambistry (science of exchange), political economy, as well as some essential features of bookkeeping and accounting, the importance of which is beyond question in commercial practice. Still, such deficiencies are met by an explanatory remark which accompanies the document, to wit:

This course, together with the time-table attached, is to be regarded merely as a guide, a declaration of principles according to which the chamber would like to see commercial instruction conducted. The detail may be arranged for each year to suit the needs of each school. Full liberty is desirable in this.

After the sixth school year the juniors must submit to an examination in the following obligatory studies, and in at least one optional study: (*a*) Obligatory studies: English and literature, French (eventually German, Spanish, Italian, or Portuguese), history of the commerce of Great Britain and her colonies, commercial geography, arithmetic, mathematics, bookkeeping, drawing. (*b*) Optional studies: Mechanics and hydrostatics, sound, light and heat, electricity and magnetism, organic chemistry, natural history, geometrical drawing, shorthand writing, and Latin. Having passed the examination, the pupil receives a "junior commercial certificate." For pupils of only elementary preparation an examination is held at the close of the third year, which entitles them, if successful, to a "certificate of elementary commercial training."

For the senior course the following obligatory branches are proposed: Foreign languages, that is, two of the following, French, German, Spanish, Portuguese, Italian, and Latin; mathematics, including higher commercial arithmetic and geometry; commercial geography; universal and commercial history; political economy and banking; insurance; commercial and factory laws; drawing and photography; natural sciences, to wit, chemistry, physics, mechanics, mineralogy and petrography, metallurgy, botany, zoology, and the use of the microscope; practical exercises in the laboratory. For this senior course, also, an examination is provided, after which a "higher commercial certificate" is granted. For this examination the following studies are obligatory: Two foreign languages, English and literature, mathematics, commercial history, and geography.

Owing to the omission from this course of studies, of branches absolutely essential for thorough commercial preparation, the plan did not remain without serious opposition on the part of prominent experts. During the general meeting of members of chambers of commerce in 1887, the representatives of the Bristol chamber said that not only prominent school men had denounced the plan of study, but very few chambers, despite their formal approval, had felt impelled to establish commercial schools on the proposed basis. The chambers of Manchester and Edinburgh recently worked out kindred courses of study, which they fashioned after German and French models, with this essential difference, that the courses are intended for both boys and girls.

General approval has been given by people interested in the subject to the emphasis with which the importance for future English merchants of a facility in foreign languages was urged. It was said that English merchants, above all other things, need to learn foreign languages, and he who knows the peculiar conditions of English education will agree that the ignorance of foreign tongues in England is widespread.[1] In Austria and Germany foreign tongues have been the most prominent feature of commercial training.

Of the London schools which adopted the scheme proposed by the chamber of commerce may be mentioned the famous King's College. The institution arranged not only a "senior course" for boys over 15 years of age in evening classes, but also a day-class department preparatory to the evening commercial course. This department prepares merchants, clerks for civil service, and other occupations or professions. In this department the chief attention is paid to the study of German and French. The prospectus of King's College says:

> The special subjects of study in this division are French and German, which are taught colloquially as well as grammatically, and include commercial correspondence. If desired, Spanish and Italian are taught as subjects of private tuition.

The other branches taught in this department are: Commercial geography and history, arithmetic, bookkeeping, calligraphy, drawing, and shorthand writing. Lessons in religion are given to every student, unless the parents request that they be dispensed with. Another important London school, having its own commercial department, is the Royal Polytechnic Institute, which prepares its students for the acquisition of a "chamber of commerce certificate," and likewise acts as a normal school for commercial teachers. Special mention should be given the secondary school established in 1866 by the "Corporation for Middle Class Education." This school is located in Cooper street, City Road. It has become one of the foremost public high schools of London under the skillful guidance of its principal, Dr. Wormell. According to the explicit order of its founders, the institution has the chief purpose of giving young people who intend to enter upon commercial pursuits a preparation suitable for their future vocation. It intends not only to give them suitable instruction, but also "train them in those habits and views which will secure for them the best and most lasting success in their future positions." The pro-

[1] Professor Fleischner, in stating the fact that few English merchants know foreign tongues, seems to attribute it to the system of training in vogue in England. But that is not the real reason. It is the result of "a natural cause," so to speak. English, of all the modern European tongues, is easiest to learn. It has scarcely any inflections and no difficult syntax. Compared with German and French it is almost grammarless. Speaking English is building a wall with unhewn stone, while speaking German means hewing each block to fit the place; the English-speaking person uses much mortar in form of prepositions to show the relation of words. Hence the acquisition of the English language in early youth does not give that linguistic training which children of other nations get, and which enables them to master foreign languages. Everyone whose mother tongue is difficult to learn and to use, on account of its wealth of forms of inflection and difficult syntactical rules will, of necessity, acquire a linguistic training in early youth which enables him to grasp other idioms with ease. The Germans learn foreign tongues quite readily. They even learn to speak Latin in secondary schools. More talented in languages even than the Germans are the Russians, whose language is rigid in forms and finely inflected. But the easy, unruly English is bound to become the language of trade all over the world, and moreover it will remain the language that brings forth the greatest orators. It is like a handy tool to a workman. A jackknife may be used for a variety of purposes, while a finely mounted and adjusted instrument may be useful for a few purposes only.

gramme of this school includes English and its literature, history and commercial geography, mathematics, calligraphy, bookkeeping, chemistry, drawing, French, vocal music, and the elements of natural science. German is an optional study. * * *

As has been stated before, the first step toward a systematic teaching of commercial branches was taken by the London Chamber of Commerce by proposing a model course which unfortunately proved inadequate. But this influential body intends to go further and establish, on a large scale, a commercial college of six grades, in case its new proposition finds general approbation, and it is confidently expected that this institution will find many imitators and lead to other establishments all over England. Already the consciousness of inadequate commercial training among the English merchants has led to changing purely classical secondary schools into commercial colleges. An example of this is the "City of London School." This institution, founded by the city authorities as a kind of classical high school, did not find the desired support among the people, and it was soon found desirable to add a technical course in which foreign languages, bookkeeping, political economy, and shorthand writing were prominent features. From the annual report of the principal, Mr. Pollard, it is seen that this technical course has constantly increased the number of students, while the classical course has decreased to small dimensions. The trustees and faculty of the school are contemplating a radical change by abandoning the classical and substituting a commercial department. Such facts as these indicate the drift of sentiment.

SWITZERLAND.

The third country in which commercial training has become an object of great solicitude is Switzerland. An animated discussion has been going on there for the purpose of elevating the commercial training of Swiss young men. During the proceedings of the convention, called for a revision of the Federal constitution, which held its sesssions from 1871 till 1874, it was pointed out by prominent writers and speakers that professional commercial education should be made a Federal concern. An article was inserted in the constitution, according to which the Federal Government was granted the right "to establish higher institutions of learning and to subsidize those already in existence, except the universities, which shall remain exclusively cantonal institutions." However, since the adoption of the constitution this right has not been exercised for the benefit of the mercantile calling, though a Federal polytechnicum has been established in Zurich. Yet no calling needs Federal aid more than the commercial, for it has been acknowledged in most civilized States that mere routine work and tradition of countinghouses does not suffice, but that the merchant needs a special technical education in order to meet the ever growing competition with other countries.

Whenever in Switzerland a school question comes up, several factors are to be considered—the Federal and Cantonal Governments, communal authorities, chartered corporations, and private enterprise. All these elements had been set in motion to aid commercial education, but without any noticeable effect. On December 8, 1888, at last the support of commercial schools was discussed in the Federal Parliament, and the discussion resulted in the adoption of a set of resolutions, the salient points of which may be quoted:

The Federal Council (the executive Federal authority) is requested to investigate the question whether Federal aid can be applied under the constitution for the

purpose of establishing a higher commercial college and a commercial museum—that is to say, whether the law of June 27, 1884, according to which industrial and professional schools may be subsidized, can be so interpreted as to include the establishment of a commercial school with Federal funds.

Meanwhile several private commercial schools had been opened, which were inadequate to meet the highest demands. The Federal Council, urged by numerous petitions of commercial clubs and schools, went further than it originally intended. It contemplated the establishment of a central Federal commercial school on a grand scale. When, however, the plan was submitted to judicial authority it was decided that a school with such narrow professional aims would not be in harmony with the intentions of the framers of the constitution, but that the establishment of a central Federal schoool for "Swiss law and science of government" might be within the constitutional limitations, since its purpose was general and benefited all classes of society. In such a school the merchants might find information on questions concerning them.

The alumni of the Federal polytechnicum petitioned the Government to establish in that institution a commercial department, intended for the highest education of merchants, for it was argued that every industry had a commercial aspect which deserves preparation, and commercial science and modern languages were especially mentioned as the branches for such a department. The Council, however, failed to act on the petition.

The plan of establishing a central institution of the highest grade for merchants in Switzerland is therefore held in abeyance for the present, and the attention of men interested in the subject is concentrated on the improvement of commercial schools subsidized by the Federal Government and of private institutions. The Federal Council, April 25, 1891, passed a resolution which regulates the relation of the State to commercial institutions, the four articles of which read as follows:

ARTICLE 1. To the institutions of learning which, according to the law of June 27, 1884, are entitled to Federal aid are added the commercial schools, and hence the regulations concerning other schools will be applicable to them also.

ARTICLE 2. The executive authority is hereby empowered to grant subsidies to commercial clubs for maintaining schools, and to grant scholarships to students for meritorious work and excellent results achieved in Swiss commercial schools, as well as to grant stipends to Swiss graduates of such schools for the purpose of attending foreign higher commercial institutions.

ARTICLE 3. Minute regulations for carrying out this order are to be published by the executive, similar to those in force for other callings.

ARTICLE 4. The sum of 60,000 francs ($12,000) is hereby appropriated for this purpose for the year 1891.

After this brief historical review, it may be stated that the development of commercial education in Switzerland took essentially the same course which it took in England. About forty years ago commercial departments were added to cantonal, city, or private high and industrial schools. The typical form in which these secondary schools appear is that of a uniform course, which, after three or four years, is bifurcated into technical and mercantile divisions. Side by side with these general secondary schools a few independent commercial schools are found. These have a two years' course.

Since the organization of purely commercial schools and departments of schools differs in the various Cantons (a peculiar feature of all educational institutions in Switzerland), it would seem proper to sketch a few schools which have become typical, i. e., those of Bern,

Basel, and Geneva. The commercial school of Bern is a department of the city high school. Although a city institution, it receives aid from the cantonal government. It is a classical high school, bifurcated in the higher grades. The course is uniform for all students from the tenth to the fifteenth year of age; after that the commercial department continues for two years. The uniform course contains French and English, so that the students come into the commercial course with a good linguistic training. In the latter course the studies are as follows: Physics, chemistry, knowledge of merchandise, drawing, calligraphy, gymnastics, science of trade, history, geography, countinghouse work and bookkeeping, mathematics, commercial arithmetic, German, and religion. The total number of hours of instruction per week is thirty-seven in the first, thirty-six in the second year. The entire institution is governed by a board of trustees of nine members, of whom five are appointed by the Canton (or State), four by the city. The tuition fee is 60 francs ($12) per annum. For the second year a number of scholarships are granted.

In Basel also the commercial school is not an independent institution, but a department of the city high school. Upon a common basis rest the two sections, the technical and the commercial. The former has a course of three and a half years, the commercial one of three years. Both departments are under the same authority and supervision. Tuition is gratuitous, as it is in all city schools of Basel. The course of the commercial department contains the same branches found in the Bern school. The number of hours per week is thirty-one in the first, thirty-two in the second, and thirty-three in the third year.

Until 1887 commercial training in Geneva was given in the commercial department of the cantonal high school, but in that year an independent high school for commercial branches was established by the city, the former institution was abandoned, and the high school reserved for university preparation. The new school requires the candidate for admission to be 15 years of age. He must have passed through five grades of a college or the second grade of a professional school. For students who can not comply with these requirements a preparatory department of two years is provided. The tuition fee is 100 francs ($20) for Swiss students, but double that amount for foreigners. Nonresident students who come to study only a few branches pay 5 and 10 francs ($1 to $2) per week. The direction and supervision of this institution lie in the hands of an administrative board of twelve members, four of whom are appointed by the Canton (or State) and eight by the municipal council. The expenses for 1893 amounted to 32,800 francs ($6,456), of which the Canton of Geneva paid 6,725 francs, the city 20,155 francs; 6,000 francs were paid by the students. The course includes the following branches: French, German, English, Italian, Spanish (the last three languages are optional studies), calligraphy, drawing, bookkeeping, mathematics, geography, history, physics, chemistry, civil law, insurance and tariffs, knowledge of merchandise. At stated intervals excursions are made to mercantile establishments, after which the students report in class of what they have seen. This leads to discussions on questions of the day. The number of hours a week is thirty-three in the first and second, thirty-four in the third year. The language lessons per week are as follows: French, three; German, four; English, four; Italian, four; Spanish, three. The most prominent branch

is countinghouse practice, for which eight hours a week throughout the three years are reserved.

Similar independent schools for commercial training are found in Neuenburg, Solothurn, Winterthur, and Chaux-de-Fonds. In addition to these there are in Switzerland eleven commercial departments connected with classical and technical high schools. Commercial instruction of a lower order is offered also in "continuation schools" for elementary pupils, and commercial clubs arrange evening courses for apprentices here and there.

As a model of a commercial "continuation" school may be mentioned the school in St. Gall, where French is taught three hours a week throughout a four years' course; English, Italian, German, penmanship, commercial arithmetic, discount, and civics are the other branches. In summer the school is held from 6 to 8 a. m., in the winter from 7 to 9 a. m., and from 6 to 9 p. m. in both summer and winter. All utensils and stationery used in the school are furnished by the teachers, for which in summer 1 franc, in winter 2 francs, are paid by the student.

The educational activity of commercial clubs is chiefly directed toward the advancement of their own members in certain branches. Several such clubs recently formed a national union, which now consists of eighteen sections, of which the Swiss Mercantile Society of London, England, is one. Among these eighteen sections, that of Zurich is the most prominent. It maintains a commercial school of its own; it received in 1894 a federal subsidy of 5,000 francs ($1,000). The section club in Basel maintains courses in bookkeeping, shorthand, and commercial law, as well as several courses in languages.

The bifurcation of the cantonal high schools in technical and commercial departments, spoken of before, has not been attended by felicitous results. It has been found that the commercial instruction based on a common course of preparation with that of other high school departments is lacking certain elements essential for success. This is the reason why the independent commercial schools are increasing in number and gaining in popularity.

In 1893 the total Federal subsidy for commercial education in Switzerland amounted to 87,490 francs ($17,498), of which 46,800 francs were spent for commercial schools; 38,640 francs were paid to commercial clubs, and 2,050 francs for scholarships, of which one is used in Venice and two in Munich. In conclusion, it may be stated that the educational authorities of the Canton (or State) of Zurich in 1893 petitioned the Federal Government for a subsidy for a girls' commercial school. This petition was not granted, though, because the Federal executive interpreted the law of 1884 as giving no authority to extend commercial training to girls. Similar petitions have been sent to the Federal Government from Berne and Biel. There is, however, little doubt that these petitions will soon be granted, inasmuch as the commercial department of the technical school at Winterthur, which receives a Federal subsidy, admits girls. The local authorities of that city are highly in favor of the extension of the subsidy to schools for both sexes.

Thus we see that the people of Switzerland are desirous of keeping up with other nations in the commercial training of young men. From the willingness with which Federal, cantonal, and communal authorities contribute to that end, the future may be judged. For a long time Switzerland had not an institution for the special training of merchants, though they are the basis of wealth, aiding and directing

industry; but in late years great zeal is shown in raising the commercial branch of the nation's activity to a higher level of culture. The fact that the nations surrounding the mountain Republic are eagerly increasing their connections with foreign and transmarine markets, and for that purpose prepare suitable agents, may have led the Swiss people to imitate. They certainly had a splendid example in Austria, as we have seen in a foregoing chapter.

FRANCE.

In the year 1820 two French merchants, Messrs. Brodard and Legret, who were anxious about the future of French commerce, conceived the plan of establishing a school in France in which young men should receive instruction preparing them to be merchants. Relying on their own means, the yopened such a school in Rue de Grenelle, calling the institution "École spéciale de commerce."

The fitness of such an undertaking would at present be self-evident at a time when the necessity for commercial training is recognized everywhere, but at the time when Messrs. Brodard and Legret opened their school the enterprise was considered a very bold one. Few thought of the necessity or even of the possibility of such a technical instruction for which hitherto practical work in the countinghouse and store magazines had fully sufficed. Few believed that the commercial sciences as such could be made subjects of scholastic instruction, owing to the great number of special branches of which these sciences are composed. The establishment of such an institution, for which there was no model in existence in France, met with the greatest obstacles. An attempt had to be made to combine the various commercial branches of knowledge into one science, to find or to prepare suitable teachers for that purpose. Other circumstances added to the difficulty. Frenchmen seemed to have no decided commercial sense or interest in commerce, although it was then flourishing. France, furthermore, was, after the Napoleonic wars, in a condition which prevented a far-sighted policy with regard to commerce and industry.

All these things combined to prevent young men from attending the school in Rue de Grenelle. They wished to be admitted to the bar, become physicians and authors rather than merchants. Entrance into the mercantile profession seemed a degradation for which no especial scholastic preparation was required. Hence the new school could not expect a flourishing growth. The trustees were well-experienced men, who attempted to frame a study plan suitable for the requirement of commerce. Men like Casimir-Périer, J. B. Say, Ch. Dupuy, J. Lafitte, and others framed a plan for this new school, whose course was one of three years. At first some students entered the institution, partly resident Parisians, partly from other parts of France, but after ten years of wrestling with new problems the institution was closed. Several times it had changed directors.

In 1830 Adolph Blanqui undertook to revive the school. He first changed the name of the institution to "École supérieure de commerce," which name it has retained to this day. Blanqui may justly be called the organizer of commercial education in France, for to him are due its principles. For twenty-five years he stood at the head of this school, whose reputation spread all over Europe,[1] but the num-

[1] It is interesting to learn that in Austria this French school has been taken as a model; for instance, in the establishment of the Commercial Academy in Prague, 1856.

ber of its students remained small. After Blanqui's death the institution met many kinds of obstacles, until, in 1869, the Paris Chamber of Commerce took possession of it. Meanwhile several other schools were established in France, mostly in imitation of Blanqui's institution.

The commercial schools of France may be divided into two groups. The first comprises seven higher institutions, of which two are in Paris, five in the provinces. The second group contains four secondary schools, of which three are situated in Paris. Beside these institutions there exist numerous schools of an elementary character for adults of both sexes. Hence there are really only eleven distinctly commercial schools in France. The Superior School of Commerce, the School of Commerce, and the School of Higher Commercial Studies are all under the direction of the Chamber of Commerce of Paris, which undertook the management of the first in 1869, the second in 1872, and the third in 1882. The commercial schools in Lyons, Marseilles, and Havre, as well as the Commercial Institute in Paris, are maintained by private corporations. The school in Rouen is connected with the school of science and letters of that city; the school in Bordeaux is connected with an industrial school, while the school at Rheims is under the direct supervision of the minister of public instruction. This city has, besides, a school of commercial practice under private management. Most commercial schools in France are managed by a board of trustees called comité, usually chosen from among the prominent merchants of the city in which they are situated. In Paris the chamber of commerce elects the trustees from among its members. In the board of trustees of the school of Marseilles two teachers act as expert counselors, while the higher school of commerce in Paris has a supplementary council of 25 members, the French minister of commerce being the chairman.

The State subsidies paid for commercial education are quite large, as will be seen from the following statements: A ministerial decree of February 1, 1849, granted sixteen scholarships of 500 francs ($100) each. This sum was afterwards greatly increased, and taken from the funds at the disposal of the minister of commerce for the promotion of commerce and industry. In the year 1875, for the first time, a definite amount (equivalent to $6,000), was appropriated for that purpose, and this amount was increased (to $8,000) in 1883. The State budget of commerce in 1884 contained $5,000 for the improvement of a building occupied by commercial schools. This appropriation was increased to $8,400 in 1886. Annual appropriations were also made for traveling expenses paid to graduates of higher schools of commerce. In 1886 $3,600 was used for that purpose. This action of the House of Deputies found general approval, since the importance of traveling was recognized for these students; partly, also, because it was shown that other countries had set the example in this policy. A special set of regulations was adopted for the manner of granting these stipends. The minister of commerce is the final judge in the matter.

The courses of study in most French commercial schools are arranged for three years, that of the school in Lyons for four years, while in Bordeaux and Havre only a two years' attendance is required. Foreign students are required to pass through a preparatory department, in which they are expected to familiarize themselves with the French language. The age at which students are admitted is 15 years; schools which have a preparatory department admit to that at 14 years.

The following branches are generally found in the French commercial schools: French, algebra, arithmetic, geometry, bookkeeping,

commercial law, physics, chemistry, history, commercial geography, drawing, shorthand writing, and two foreign languages. These branches are taught in thirty-one weekly hours. The number of professors varies between 9 (in Havre) and 32 (in Paris). The teachers' salaries are arranged according to the number of lessons they give per week and the importance of their subjects. A peculiar feature of this is that the professor of law is paid six times the amount which the professor of bookkeeping receives.

In all French commercial schools weekly excursions are arranged to factories and large mercantile establishments, museums, and exhibitions. Since it is impossible to take a large number of students to one place, small groups are conducted by their teachers to various points on the same day. In France the numerous museums, art collections, monuments, and exhibitions are much more frequently utilized as agencies of education than in other countries. Elementary classes are taken by their teachers, on days when school is not in session, to museums and collections, to monuments and statues of noted men, where appropriate instruction is given. It is noteworthy, also, that the French commercial institutions of learning have many foreign students. In the superior school at Paris one-third of all the students are foreigners; the school at Marseilles has about 30, that of Havre about 50, foreign students. Diplomas are awarded to successful candidates who pass the final examination; in some of the institutions silver and gold medals are given for meritorious work. The diplomas of the Superior Commercial School, and those of the School for Higher Commercial Studies are signed by the minister of commerce.

A few details about the "Ecole Supérieure de Commerce" in Paris may conclude the review of French commercial education. This institution was founded in 1820 and transferred to the Chamber of Commerce in 1869. It is now situated at No. 102 Rue Amelot. The prospectus for 1895 says: The course is one of three years, but well-prepared students have the right to enter the second grade at once. The age of admission is 15 years. The students of the third year are guided by their professors to factories of Paris and vicinity, and report in writing what they have observed. The same students undertake a journey annually into the northern part of France or into Belgium in order to study the coal mines, means of transportation, and other things interesting to merchants. The students' reports of this excursion are submitted for competition; the best composition is awarded a traveling scholarship of 1,000 francs ($200). Examinations are held every three months, reports of which are sent to the parents. At the close of the course, medals are distributed which are provided by the Chamber of Commerce, the Society for the Promotion of Commercial Geography, and the Society of Alumni. The students who pass the final examination have the right to limit their service in the army to only one year, and the aid of the school is offered to them to secure acceptable positions in the commercial world. The State grants 12 scholarships to worthy students. Like most French schools of this kind, the superior commercial school has dormitories connected with the institution; in this school tuition, room, and board cost $400 a year, payable in three installments.

BELGIUM.

At the head of the commercial institutions of learning in Belgium stands the "Institut de Commerce" at Antwerp. The establishment

of this noted institution is due to the former minister of state, M. A. Dechamps, who submitted the plan for such a school to the city council of Antwerp and to the provincial government in 1847. At the same time a merchant, H. Mathysseus, published a pamphlet: "Propositions for the establishment of a Belgian university for commerce and industry." However, public opinion and the existing universities in Belgium opposed this plan, claiming that the science of commerce was not equal in importance to the university studies; hence the minister's plan was finally adopted and the institute of commerce opened with 51 students on October 22, 1853. The city council undertook its maintenance and management, and the State guaranteed to pay one-third of the expenses. This school has educated over 4,000 students.

The institute of commerce has an organization similar to the universities of Belgium, but unlike other schools of that country, it has no dormitories; the students live in private houses. The course is one of two years. An examination is required for admission; exempt from this examination are graduates of the Belgian Athenæum, or any institution of Belgium ranking with this high school. All candidates for admission must prove that they have sufficient familiarity with French, English, and German. For the purpose of obtaining well-prepared students, a preparatory department has been added, in which only those branches are taught which fit the student for admission to the institute. The lowest age at which admission is allowed is 16½ years. The branches in which the candidates for admission are examined are French, English, German, bookkeeping, geography, mathematics, chemistry, physics, history, commercial law, and political economy.

The most important place in the course for the first year of the institute is the practical work in the model countinghouse. Here the more theoretical branches have their focus. Here is utilized that which is taught in the scholastic branches. In the countinghouse the mercantile practice is imitated in its smallest details and widest bearings. Regular business transactions take place, and every student in turn is made to participate in all kinds of transactions and occupations. Business correspondence is first carried on in French, then in the other languages taught. Every month stock is taken and a balance sheet furnished. During the first year business is done only with European countries; in the second year the business is extended to transmarine countries. All the bearings of trade are taught, so that the students gain a clear view of commerce and its ramifications all over the world.

The lessons are distributed in hours per week, as follows:

Lessons.	First year.	Second year.
Countinghouse practice	12	12
Commercial arithmetic	3	3
Chemistry and knowledge of merchandise	2	2
Political economy	1	2
History of commerce	2	.....
Geography of commerce	1	3
Commercial and maritime law	1	1
Elements of international law	1	.....
Tariff legislation	1	.....
Knowledge of shipbuilding	1	.....
Dutch language	2	2
German language	3	3
English language	3	3
Spanish or Italian	3	3

Besides these regular lessons and lectures, occasional talks are given by prominent merchants, manufacturers, engineers, and other experts on subjects closely connected with mercantile pursuits. On days when the school is not in session, visits to commercial and industrial establishments are made by the classes, conducted by their teachers; but, unlike the commercial schools in Paris, this institution does not arrange for discussions on the part of the students. Lately it has been urgently advocated to add a third year to the course. This third year should be devoted chiefly to the legal aspect of commerce, and should serve as a special preparation for consuls, since in Belgium the consular service is chiefly recruited from among the merchants.

Every regular student is examined at the close of the first and of the second year. Having passed the final examination, the student receives a diploma entitling him to the degree of "Licencié dans les études de commerce." The examining board consists of seven members appointed by the minister of commerce from among the leading merchants and the professors of the institution. The Government is represented at this examination by the inspector-general of commerce. Graduates receive, upon application, traveling stipends, which are paid by the State. The legislature or parliament appropriates 45,000 francs, or $9,000, annually for that purpose, and the stipends vary between $1,000 and $1,200 per annum, according to the country to which the students go. They must agree to stay three years in that country. During recent years the graduates receiving stipends have sojourned in transmarine countries, Argentina, Brazil, China, Japan, India, Australia, and New Zealand. They have established Belgian agencies for commercial firms in these countries, and have opened new channels of trade for Belgian products of industry. Some of these graduates have been appointed Belgian consuls in foreign countries.

Despite the undeniable advantages derived from the Antwerp commercial institution, it can not be said that it has found general approval in public opinion. In Belgium a certain prejudice, entertained even by educated people, against the commercial calling seems to react against the State's subsidy for scholastic preparation of merchants. The idea is still prevalent that practice alone can serve as proper preparation for a merchant, and that all theoretic instruction is superfluous. It is not considered that theoretic instruction is the basis of continuous self-culture, and that in this century of science, discovery, and, invention neither the merchant nor one in any other profession or calling can be properly prepared without thorough scientific work; and furthermore, that without familiarity with foreign languages no merchant can enter into competition with the merchants of other countries in the world's markets. Other countries have found that the money spent in educating and training commercial students is by no means squandered, but yields large interest.

For sixteen years the institute in Antwerp struggled for existence, and in 1869 it had only 67 students, of whom 35 were foreigners. Since then the attendance has increased, partly owing to a reduction in the tuition fees, partly owing to the stipends paid to graduates by the State. Belgium, with a population of over five and a half millions, among whom the industrial and commercial people are very numerous, would seem to need more than 80 graduates per annum from the only higher commercial institution the country possesses. The Belgian "Atheneums" or high schools give also commercial instruction to a

limited degree, but their graduates rarely devote themselves to commercial pursuits.

In conclusion, a society may be mentioned which owes its origin to the Antwerp higher commercial institution. It is the "Société des anciens élèves de l'Institut de commerce" (society of alumni), which has the purpose to acquaint the commercial world with all the new ideas that intimately concern Belgian commerce. The members are earnest supporters of their alma mater. The society arranges public lectures on political economy and participates in international commercial congresses representing Belgium. It grants scholarships to students of the institute and publishes a periodical in the interest of Belgian commerce.

ITALY.

The beginnings of commercial training in Italy do not date back many years. The law which organized public instruction was passed in 1859, and in this law an article referring to commercial education determines that those who intend to devote themselves to commercial "as well as any other technical" pursuits, should attend the "Instituti tecnici," so called in contradistinction to classical high schools. These institutions have a section for agriculture and technology, and another for commercial studies (sezione commercio e ragioneria). Graduation from these institutions enables the students not only to gain good positions in mercantile houses, but entitles them also to certain State offices.

The commercial "sections" or departments in technical high schools offer instruction in bookkeeping, correspondence, knowledge of merchandise, banking and commercial law, and French, while German is an optional study. There are about sixty of such institutions in Italy. They are subsidized by the State, but, according to the verdict of the mercantile world, they are not sufficient to meet the ever growing demands of the time. A higher institution was needed such as nearly every profession and calling had. The universities prepared for the learned professions; the engineering school at Milan prepared thorough technologists and engineers; the school of shipbuilding at Turin thoroughly prepared shipbuilders; artists had several schools, and the school of design at Genoa prepared young men for industrial arts. Only the merchants had to rely on secondary schools. At last, in 1867, a beginning was made to supply the want.

It was in Venice, the city which had been famous for many centuries for her extensive commerce and successful industry, where higher instruction for commercial men was begun. In July, 1867, the directors of the "Stabilimento tecnico" petitioned the city council for an appropriation with which to establish a higher commercial school. The city council, and other bodies addressed for the same purpose, declared their willingness to aid the institution, since the need of better preparation for merchants was acutely felt. After an executive committee had been appointed, the Royal Government was also asked for a subsidy. This Government was willing to contribute annually to the maintenance of such a school if the founders would consent to devote it to three purposes: (1) To offer higher instruction for mercantile pursuits; (2) to give instruction in law for the professional preparation of consuls, and (3) to act as a normal school for teachers of commercial schools, and for that purpose lay especial stress upon the teaching of foreign languages. The Government

provided further that the board of trustees of the institution should have one member proposed by the Government.

In 1871 the institution was opened under the most favorable auspices. The number of students was considerable, and it has since steadily grown. The school is called "Regia Scuola Superiore di Commercio" (Royal Higher School of Commerce), and it has five yearly grades. At first a preparatory department was maintained, but that has been found unnecessary and has been abandoned. At present (in 1896) the institution is conducted by Senator Francisco Ferrara. The province of Venice pays a sum equivalent to $8,000, the city of Venice $2,000, the board of trade $2,000, and the Italian Government $6,000 per year for its maintenance.

It has its seat in the palace Foscari, which has been given over to this purpose by the city council. The school takes regular and irregular students. The latter prepare themselves for particular branches, such as the consular service. Candidates are required to submit to an examination for admission, except those who graduated from technical lyceums (modern high schools). This examination includes the Italian language and literature, geography, history, arithmetic, algebra, physics, natural history, French, and shorthand writing. It is possible for a candidate to enter the second year's course if he is in possession of the required knowledge and has passed his seventeenth year of life. The tuition fee amounts to 50 florins (about $25) per annum. Extraordinary students pay 6 florins ($3) per annum for each branch of study they choose. The Royal Government, as well as the other agencies which support the school, grant scholarships; the same is done by the boards or chambers of commerce in other cities when they send students to this school in Venice.

In accordance with the expressed desire of the Royal Government, the school consists of three departments: (1) The general department, which prepares students for commercial pursuits in a three years' course; (2) the consular department, which has a course of five years, and (3) the commercial normal school, which prepares teachers for commercial schools in a course of four years. In this latter-named department the chief studies in the first year are political economy and statistics; those of the second year are the common commercial branches; those of the third year are knowledge of merchandise and chemistry, and those of the fourth year are foreign languages. With this normal school department a practice school is combined, in which the students learn how to teach the commercial branches. The studies of the other two departments are, aside from the purely commercial studies, commercial history and political history, English, French, Italian, German, and one oriental language, international law, criminal law, constitutional law, court procedure, commercial and maritime law, and in the consular department certain additional branches are taught which are prescribed by the Government and refer to consular practice.

Graduates receive diplomas, and those of the normal school have the right to teach the commercial branches in any school in Italy. The discipline is very strict; punishment begins with simple censure and may end in expulsion. A board governs the school. To this board representatives are sent by the Venice Board of Trade, the city council, the province of Venice, and the Italian Government. The director or principal is assisted by two secretaries. Subsidies from State, province, city, and the board of trade, together with the tuition fees, suffice to defray the expenditures. The school has no fund.

The professors are paid between $600 and $1,500, and their appointment, dismissal, or promotion has been reserved to the Government. At date of last report (1894) the institution has 18 professors and 2 assistants.

The school has the rank of a university, and graduation from it entitles the student to the same rights granted to graduates of State universities. This commercial State institution has rendered very valuable service to Italian commerce. It possesses an extensive museum of merchandise and a large library, for the maintenance and extension of which 1,000 florins ($500) are used annually. Besides these it has the entire equipment of a first-class commercial school. However, the Italian merchants persist in engaging German clerks in preference to Italian. Still, the school in Venice has found two imitators—one in Genoa and one at Bari. The future of these two institutions seems to have been secured, since, as the reports say, their instruction is purely technical and of a practical character. This is a feature which is generally appreciated by merchants who are not given to theoretical consideration of any question. Anything that is not directly aiding the technical preparation of merchants is excluded from the course of study of these schools.

In 1875 a committee was formed by the board of trustees of the school in Venice, whose business it is to help the graduates of the school to secure lucrative positions. At the head of this committee stands the president of the chamber of commerce. The results of the committee's labors are very satisfactory. Not a single graduate of the school has remained unemployed.

The modern Kingdom of Italy has done much in the field of education and instruction. It has called into existence establishments which have become famous. In regard to commercial education it has not remained behind other countries. In Turin a commercial school of three grades was founded in 1856. Its founder was a graduate of the Paris "École supérieure de commerce," Jean Joseph Garnier. Other commercial schools in Italy are of later date. There is one in Florence, established in 1877; one in Genoa, founded in 1883. Other large cities in Italy—for instance, Rome and Naples, in which a certain industrial feature is prominent—have commercial schools supported by private persons, communities, boards of trade, or commercial societies. The school founded and maintained by the society of "Archimedes" in Turin occupies a peculiar position. It is now (1895) 14 years old, has 60 classes and 64 teachers. In 1894–95 it had 1,675 students, male and female, and 1,300 graduated after one year's study. The course of study includes Italian language, arithmetic, bookkeeping, penmanship, French language, drawing, electro-technology, shorthand writing. The girls learn, besides most of the foregoing branches, sewing and embroidery.

The right to attend a common commercial course is obtained by passing an examination before a government commissioner, but if the student wishes to study languages and geography he is obliged to pass an examination for admission to a university. In other words, these two branches, belonging to the university course, are classed among the branches of higher education. For ordinary commercial branches a diploma of graduation from a lyceum is sufficient.

The foregoing statements concerning the commercial training in France, Belgium, and Italy plainly show that the authorities lay particular emphasis upon the technical training in commercial schools, but they do not neglect the educational side which tends to general

culture, moral and intellectual. It may be desirable to touch upon this point with reference to professional schools of all kinds.

The development of the entire educational system, which has increased at a rapid rate and in a most satisfactory manner in recent decades, has resulted in a division of labor, owing to the ever-increasing amount of knowledge and skill to be gained, and this has caused the establishment of many kinds of professional and technical schools which lay more stress upon special and less stress upon general education. These schools, obedient to the urgent social demands of the time, have become a very important factor of the educational agencies of the modern nations. They are intended to give a special training which formerly was rarely offered in schools, and it is expected to be done in the shortest possible period, with the least expenditure of money, and upon a basis of a brief preparatory study.

There is little doubt that these institutions meet the requirements in regard to special or technical training; for private persons, as well as municipal and State authorities, continue establishing schools of this kind, and their graduates are generally found to meet the requirements of practical life. But quite another question is whether these schools are truly educating their students.

It is a postulate of pedagogy that every kind of instruction—hence, special, technical, or professional instruction not excepted—has an educational influence. Every school must have a twofold object, (1) to give technical knowledge and train the intellect, and (2) to ennoble the soul and establish character. In this latter sense all instruction may be educative if it be good and in accordance with the proper spirit, but it is nevertheless essential in special schools to keep in mind the distinction between mere instruction and educative instruction.

The demand for education or ethical training, and the endeavor to give it much room without infringing upon the purely technical training, have become more important since the changed social conditions have laid upon the schools duties which the family and home used to perform—that is to say, ideas of morality and religion, good manners, and public spirit are expected to be inculcated by school education. Under the pressure of business and in the haste with which everything is done, and must be done, the home has lost its influence upon the young generation, and the school is asked to supply that ethical training which will make good men and women of our boys and girls. Hence every school must make it an object of its work to offer both teaching the intellect and training the will.

It is plain that the commercial schools must not stand aside in this; that they, like all other educational institutions, must aim at an education which is following certain higher considerations than how best to enable their students to earn their living. They should aim at ethical perfection of their pupils, at ennobling and training of their characters, at the education of a generation filled with public spirit and patriotism, a sense of true humanity, justice, and regard for the law, faithfulness to principles and constancy in action. In fact these schools, certainly no less than other schools, should aim at all those virtues which make good men first before they think of becoming good merchants.

There are a great number of educational momenta to be considered, not to speak of what these schools as such may demand of their students. Obedience to orders, attention, courtesy, truthfulness, reg-

ularity—virtues which are conditions of every healthy school organization.

At the first glance it would seem as though such ideas could only be taught in connection with religion and history, but the best occasions after all are those which the teaching of the mother tongue offers. It is therefore very essential for commercial students to have a "reader" (text-book for reading), which contains suitable matter for ethical instruction. It has often been said that the reader in the class room is the center of instruction. This book is not superfluous for commercial schools. It may offer numerous occasions for ethical instruction, which without such a book might never be given. By means of analogy the interest of the students may be awakened in events outside of home and school. The various institutions of charity, which, following the humane spirit of the times, are established by State and community, may arouse the students to an early consideration of public affairs, so that the blighting egotism, so easily engendered by the study of commercial branches, may be counteracted by influences which will aid in making good, public-spirited citizens of the young. The reader may give the starting point for lessons which bookkeeping, arithmetic, and similar technical branches can not give. Yet even the purely technical branches should be pressed into service of the one supreme object of the school: To make good men and good citizens.

CHAPTER VII.

THE TEACHING OF CIVICS IN SWITZERLAND, FRANCE, AND ENGLAND.

Attempts made in this country in behalf of teaching civics (the science of the State, its constitution and functions) make it desirable to see what is done in this direction in other countries. Naturally the reviewer's glance turns first to countries of a similar form of government, to wit, republican government, which we find in France and Switzerland. There is not another country in the world that has a government more popular than Switzerland has, and it is gratifying to note that in that Republic civics is a regular branch in the advanced elementary schools (the so-called Fortbildungs-Schulen). In the following pages a translation is presented of the little text-book used for the purpose of teaching civics (Staatskunde) in Switzerland. Its author is Dr. Albert Affolter, of Solothurn (Souleure).

THE TEACHING OF CIVICS IN SWITZERLAND.

I.—THE STATE IN GENERAL.

A.—The Commonwealth.

1. *The Commonwealth.*—Man has the desire not to live alone, but to join other men and associate with them. The simplest and most original association of human beings is found in the family. Several families unite together to form a tribe, a community, a province, a nation. The reason why human beings unite to form society lies in the feeling that only by means of a common, firmly established order of intercourse prosperity and protection against hostile attacks can be secured. Society thus formed, if settled, is called a community.

The purposes of the community are preservation of peace and order in the interior and protection against common foes, as well as promotion of the common weal. These purposes give the community the qualities of a public alliance, or union, or society. This public community is distinguished by the purposes mentioned from all other unions which may be formed for economic, religious, social, and other purposes (business companies, cooperative societies, clubs, etc.).

2. *The State.*—The highest community is the State. It is an association of human beings formed by means of firmly established organization, limited to a clearly defined country or territory. The human beings belonging to this association called State are the people; the established order or organization is the legal order, and the land occupied by these people is the territory of the State. Hence the State consists of land or territory, legal order, and the people. The order prevailing is the result of organization, and the State therefore appears as a being endowed with life, the state system, which has a will of its own, the will of the

State, and active organs, the officers of the State. It is, so to speak, a person having tasks to perform and entering into communication with other States.

3. *Communities.*—Even within the confines of the State there are public associations—the communities. They, too, have the object to maintain order and promote public affairs. But the community does not have the object to protect its members against attack from without; the State alone does that. Like the State, the community has a clearly defined territory, a population, and a firmly established order. According to their objects the communities are of different kinds. There are civil, church, and school communities.

B.—Kinds of States—Attributes.

4. *Sovereignty.*—The term sovereignty is used with respect to States as well as persons.

The sovereignty of the State means its independence of other States and its self-government in arranging its own affairs. A State, therefore, is sovereign when it stands in no relation of dependence and has complete freedom of action in its interior. There is also a limited sovereignty. It is even possible to speak of the sovereignty of a community, since the communities have for certain purposes full liberty of action, to regulate their own affairs, for instance.

The sovereignty of persons means that they have the highest power in the State. Thus we designate rulers (emperors, kings, princes, etc.) with the term sovereigns. Where the people themselves represent the highest power, we speak of the people's sovereignty.

5. *Republic and monarchy.*—According to the manner in which the State is organized we speak of its being a republic or a monarchy.

In the republic the highest power remains with the people. It is the sovereign. Its will determines every public question. To direct the State, only such men are called in whom the people have confidence, and they stay in office only so long as they please the people. At the head of the State, therefore, there are men who are elected, that is, chosen, either by the people or its representatives. The republic rests on the people. If this will is expressed directly, so that the people decide all important questions and perform the chief elections (voting and electing orally in town council or by means of the ballot box), the republic is a purely democratic one. If, however, the people designate by means of elections certain representatives who are to perform the business of the State in the people's name, the republic is called a representative democracy.

A monarchy is a State in which the sovereignty is not in the people, but in a certain person, the monarch. He comes into power by inheritance belonging to the ruling family or dynasty (hereditary prince or monarch). In former times the monarch could also be elected in that he was an electoral prince or monarch. The sovereignty of a monarch has been circumscribed and limited in most cases by the will of the people's representatives (parliament), to the end that he can not institute an important measure without the consent of parliament. States in which the people's representatives in parliament assembled take part in directing public affairs are said to be constitutional States.

6. *The State of law.*—The association called State is made possible only by firmly established legal order. Every officer of the State is obliged to conform with this legal order, and no one is allowed to violate it. It must be possible to bring to the notice of an independent judicial court any arbitrary harmful action and all violations of the law on the part of public officers. A State in which the law is thus respected and the necessary institutions for its application are provided, so that no violation of law, even though it be that of the highest officer, remains unpunished, we call a perfect State of law. It is that State in which no one stands above the law and dares to defy it.

7. *Federation of States and union.*—Small States frequently observe the necessity to join forces, in order the better to withstand attacks from without. This attachment of several States may be a loose or close one. A federation of States is called a group of States joined together so that each State loses some of its sovereignty toward the outside world, but not in the interior. In this case each State is left free in the management of its own affairs so long as they do not conflict with the common purposes of the federation. A union, on the other hand, is a firmly riveted combination of States, in which the latter lose a part of their sovereignty toward the exterior as well as the interior. The authority they lose is bestowed upon the central or union government, which has permanent offices. A union of States bears in itself the possibility of developing into a single State.

The Swiss federation was loosely combined from its origin until the year 1798, and then again from 1803 until 1848. Between 1798 and 1803 it was a union, and since 1848 it has again assumed the character of a union.

C.—Duties of the State.

8. *In general.*—The State has duties to perform in the interior and in relation with other States. It tries to promote peaceful intercourse with other States, and if the necessity should arise, to repulse unjustified attacks with the aid of the army. In the interior it maintains order, cares for the common weal, and protects the liberty and rights of each citizen. In the performance of these duties the State, or rather its officers, must be very diligently active. Those who stand at the head of the State promote the relations with other States and represent it toward the outside world. In the interior the officers see to it that the functions of the State are performed without hindrance. The officers and their work are called collectively the government. Since the rules for the interior order and the rights of the citizens are not at all times the same, but are ever requiring improvement, it becomes necessary to change them from time to time. The activity of the organ that is intrusted with such changes is called legislation or lawgiving. The officers designated to perform such work are the legislators. In cases in which the law is violated, certain officers of the State see to it that the law is vindicated. This action is called the judicial duty of the State, and the officers charged with it the judiciary of the State. The State also sees to it that it has means at hand to secure and protect the possessions of the State, to promote general welfare, to improve the army and other means of defense; in short, to carry into effect all those measures which are for the general benefit and are provided for by legislation. This extensive activity as a whole is called the administration, and the officers who are charged with its performance are the organs of administration, often called the authorities. Hence the work of the State is divided into three great divisions: (1) Legislative branch; (2) administrative branch, and (3) judiciary branch. The first makes the laws, the second executes them, and the third defines and, if necessary, vindicates them.

9. *Separation of powers.*—It is generally required in the modern State nowadays that the officers of the different branches should be separated—that is to say, that those active as lawgivers should not at the same time be executors or vindicators of the law, but that there be separate officers for each branch. This separation is carried out in nearly all constitutional States of the civilized world.

10. *Self-government.*—The State's officers do not perform all the work necessary to be done for the State, but they leave much of it to be done by parts of the State and by communities. In a federation, the separate States make, execute, and vindicate laws for their own territories, and the communities again as parts of the State do the same in affairs concerning themselves only. This free use of the right to act for the common weal given to communities is called self or local government, also local administration.

D.—Territory and Population of a State.

11. *Territory.*—The territory of a State is the extent of land within its bounds. All persons and possessions occupying the territory are subject to the law of the State.

12. *Population.*—The population of a State is distinguished as citizens, inhabitants, or residents. Citizens are those who enjoy the civil rights of a State; collectively, they form a people or a nation. Civil rights embrace certain privileges, as the right of suffrage and eligibility to public office, which are denied to resident foreigners. A citizen living in a foreign country enjoys the protection of the State to which he belongs; this protection is guaranteed by means of ambassadors and consuls. Inhabitants, are those who reside permanently in the State; the term includes citizens and resident foreigners. Besides inhabitants, the term residents includes all sojourners (travelers, tourists, etc.). The law of a State applies to any person during his presence within the confines of its jurisdiction.

E.—Legal Order of the State.

13. *In general.*—Law is the established order of a State. All organizations of a State, its division, official power, and reciprocal relation of public officers, as well as the judicial relations of population, are fixed by law. Law makes a State of population and the territory which it occupies; the whole being of a State depends upon it. The term law defines not only order of a State, but the rights of the individual which pertain to him because of legal order.

14. *Division of the legal order.*—The rules of order are contained in certain laws; sometimes custom determines action in cases for which there is no prescribed law. Laws and judicial customs are the sources of jurisprudence.

The chief of all laws is the constitution, containing the principles of a State; it is the fundamental law of a country, and treats of the organization and division of a State and the relation of public officers to one another and the people. A series of minor laws refer to judiciary details relative to the administration of justice and the rights and duties of individuals. The constitution and the laws of administration are known as public law. We distinguish others:—Laws of litigation apply to detailed proceedings in the administration of justice; penal laws define what actions and omissions deserve punishment and how severe the punishment may be; laws of private and civil rights apply to the private relations of citizens, as the family, possessions, business, contracts, claims and debts, inheritance, etc. We may define civics as the study of the law and working of a State.

II.—SWITZERLAND IN GENERAL.

A.—History of the State System of Switzerland.

15. *The old confederation.*—The league of the three districts, Uri, Schwyz, and Unterwalden, in the thirteenth century was the germ of Switzerland. A Latin contract signed by these districts in 1291 is still extant. The league was formed for defense against attacks from without, and particularly against the rulers of Hapsburg-Austria. After the glorious battle of Morgarten, 1315, it was renewed at Brunnen. Soon afterwards neighboring cities and districts joined the alliance—Lucerne in 1332, Zurich in 1351, Glarus in 1352, Zug in 1352, and Berne in 1353. The league now comprised the so-called eight ancient cantons. In the year 1481 Fribourg and Soleure were admitted. Later on Basel (1501), Schaffhausen (1501), and Appenzell (1513) joined. From now on until 1798 Switzerland formed a league of thirteen cantons, to which several friendly and affiliated districts, as well as different houses and families, belonged. Common affairs were discussed and regulated by the diet, which consisted of delegates from the separate cantons.

The old league was a confederation. It dissolved in 1798 because of the consequences of the French revolution.

16. *The Helvetic union.*—Owing to the attitude of France, the necessity of a constitution was forced on Switzerland in 1798. The old league was thereby converted into a union under the name of the one indivisible Helvetic republic. The one undivided republic consisted of 19 cantons which were not States, but only administrative districts without sovereignty. The conversion of the old confederation into a union was accomplished too suddenly and occasioned great difficulties.

17. *Acts of adjustment.*—As a union proved indefensible under existing conditions, the First Consul of France, Napoleon Bonaparte, framed a new constitution for Switzerland in 1803. It was called acts of adjustment or mediatory constitution. Switzerland thus became a federation of 19 States, very nearly sovereign. The confederation, however, approached close to a union. The highest authority was vested in the diet, to which each canton sent one delegate. Only cantons with more than 100,000 inhabitants were allowed to send two delegates. Six representative cantons alternately directed affairs. The president of the diet received the title of landamman of Switzerland. In granting more rights to the people, this constitutional adjustment brought about a better state of affairs than existed prior to 1798.

18. *The federal agreement of 1815.*—The fall of Napoleon nullified the constitution forced upon Switzerland by him. With the cooperation of the great powers of Europe, a new constitution, the federal agreement of 1815, was brought into effect. Switzerland then became a federation of 22 sovereign cantons. At the Diet, in which each canton had one vote, the delegates of the cantons were obliged to speak and vote as they had been instructed by their governments. The number of representative cantons was limited to three and the office of landamman of Switzerland abolished. The adoption of the constitution of 1815 was a decided step backward; no rights were granted to the people, and the privileges of old, aristocratic families were not expressly withdrawn. Consequently, the same conditions that existed in 1798 prevailed again in several cantons.

Dissatisfaction gradually spread, and democracy and acknowledgment of the people's rights were set against aristocratic rule. This movement, not always subsiding without bloodshed (Putsche), led to progressive development in most of the cantons since 1830, and finally, in 1848, to a new constitution.

19. *The federal constitution of 1848 and 1874.*—The federal constitution of 1848 marks an epoch in the interior relations of Switzerland. This constitution made Switzerland a union after the model of the United States of America. The year 1874 marked the adoption of a new federal constitution, which was more an enlargement than a complete change of the one of 1848. Since 1874 several articles have been amended or supplemented.

B.—Foundations of the Legal Order in Switzerland.

20. *In general.*—The foundations of the legal order in Switzerland are partly national laws and partly cantonal laws and customs.

The laws of the confederation are unconditionally paramount to the cantonal laws and customs. A national law of itself neutralizes all contradictory cantonal laws and prescriptions. The constitution, the basis of political action, is one of the laws. Besides the laws there are important ordinances and regulations for carrying them out. The political treaties between Switzerland and foreign countries, or among the cantons themselves, have the same force as laws.

21. *Foundations of national law.*—The chief foundation of Swiss legal order is the federal constitution of 1874, with later amendments and additions.

Only those laws are national which have gone into effect since 1848; provided they have not been annulled or replaced.

The numerous political treaties between Switzerland and foreign countries have similar significance.

22. *The foundations of cantonal laws* are the cantonal constitutions, laws, and ordinances since 1803, in so far as they have not been annulled or replaced.

The political treaties among cantons (concordats) formerly in force for the better enactment of laws were, at one time, of importance; later federal laws have rendered them superfluous. In some cantons legislation is not complete; old customs hold good to the same extent as statutes in some fields of the law.

Cantonal constitutions, laws, ordinances, and customs are valid only when they are not contradictory to the Federal constitution, national laws, resolutions, and ordinances, or a national political treaty.

C.—Nature of the Swiss State.

1.—CONFEDERATION AND CANTONS.

23. *Relation of the confederation to the cantons.*—The confederation is a State consisting of 22 or, reckoning half cantons, 25 separate States. The distinction between the confederation as a State and the cantons as parts of that State does not refer to territory and population. Both of these are common to the confederation and the cantons. The distinction lies in legislation, administration, and jurisdiction. The confederation has its definite attributes, and where these maintain cantons are subordinate. When cantons are not restricted by the confederation, they are sovereign. Relations with foreign countries are determined by the confederation. It has the right to declare war and peace and negotiate contracts and political treaties, as well as customs and duties, acts and commercial treaties with foreign countries. It is only in exceptional cases that cantons, under supervision of the confederation, can negotiate treaties with foreign powers on subjects of minor importance, as, for instance, fishing in boundary waters.

24. *Protection of the cantons by the confederation.*—The confederation protects the cantons, their province, constitution, and officials. It also protects individual citizens against aggressions of cantonal officials. The confederation has a right to interpose when interior order and peace are disturbed (federal intervention).

25. *Guaranty of cantonal constitutions.*—Cantons must submit their constitutions to the confederate convention for approval, which is given only when the constitution in question throughout supports federal rights; is republican, i. e., invests the people themselves or their representatives with the highest power, and may at any time be revised when an increase of citizens so demands.

2.—CITIZENSHIP IN SWITZERLAND CANTONS AND TOWNS.

26. *In general.*—Swiss citizenship is the state of being vested with the rights and privileges of a Swiss citizen. Every citizen of a canton is a citizen of Switzerland. No one can be a citizen of Switzerland without enjoying the rights of cantonal citizenship. The latter is combined with town citizenship.

Swiss citizenship is not limited by time, no matter how long a Swiss may reside in a foreign country. Cantons have not the right to banish their citizens or deprive them of citizenship.

27. *Acquisition of Swiss citizenship.*—Citizenship is hereditary. Children of Swiss citizens are citizens of Switzerland, even though they may have been born in a foreign country. Foreigners become citizens by naturalization. To be naturalized, an applicant must have lived at least two years in Switzerland, and be no longer subject to enlistment; the grant of naturalization must be obtained from the Administrative Federal Council; enfranchisement takes place when a canton bestows citizenship upon the applicant. This is done only after he has been assured of communal citizenship.

28. *Forfeiture of citizenship.*—The rights of a Swiss citizen, and thereby those of a Canton or town, are forfeited only by residence in a foreign country and by application for the naturalization of a citizen and his family elsewhere. At the death of the father, a family can apply for readmittance as citizens of Switzerland.

29. *Citizenship in Cantons and towns.*—Anyone can be invested with citizenship in another Canton, provided that he has been naturalized in a particular place of that Canton. In this case he can retain or renounce his rights as a citizen of the Canton and town which he has left. It sometimes happens that a person desires naturalization merely in a different town of his native Canton. In most Cantons communities are obliged, under fine, to invest with citizenship cantonal citizens living within the community.

3.—RESIDENCE, ABODE, SOJOURNMENT.

30. *A residence* or domicile is the place where a person intends to dwell permanently. A person can have but one place of residence. Temporary absence does not change his residence. A change of location, with the intention of permanently dwelling elsewhere, removes residence from one place to another. Residence is of the greatest importance, as citizens are subject to the laws of residence, and are accordingly taxed and summoned before court (civil domicile).

31. *Abode and sojournment.*—These terms apply to the place where certificates of citizenship are delivered. This place regulates the exercise of political rights (political domicile). Abode and residence, therefore, have different meanings under different circumstances. The distinction between abode and sojournment is not defined by federal, but by cantonal, law. As a rule, servants, journeymen, and students are considered merely sojourners.

4.—RELATION OF THE CANTONS TO ONE ANOTHER.

32. *In general.*—Cantons can not form separate leagues among themselves, but can negotiate treaties on the subjects of legislation, jurisdiction, and administration. If one Canton has been wronged by another, it must withhold all self-redress and abide by the decision of the Federal court.

33. *Uniform treatment of citizens of other Cantons.*—No Canton has the right to treat citizens of other Cantons more unfavorably than its own.

The resident of any Canton, together with his family, is subject to its laws, and can not appeal to the legislation of his native Canton, excepting in cases of wills and improvement or maintenance of family possessions. Cantons can not tax a temporary resident who is a Swiss citizen for what he already pays taxes on in a different Canton. Cantons must care for poor, sick strangers, as for their own citizens, and must provide decent burial in case of death. The courts of one Canton can not decide the claims of anyone who is a resident of another Canton.

34. *Extradition treaties.*—Cantons are bound to mutual assistance in delivering fugitives from justice, or punishing them, by carrying into effect the sentences passed upon them in other Cantons.

III.—ORGANIZATION OF THE STATE.

A.—IN GENERAL.

35. *Kinds of boards.*—The State is so organized that boards are established for the direction and regulation of affairs. According to their chief duty, they are distinguished as boards of legislation, government, administration, and jurisdiction.

Several persons or one individual may constitute a board; in the first case it is a collegiate board; in the latter an individual board. The highest power of the Confederation, as well as of the Cantons, is vested in collegiate boards.

Members of boards, in so far as they have a defined professional capacity, are called officials. Their assistants are placemen.

36. *Competence.*—Every board has its definite duties and qualifications, known as its competence. The question may arise whether a case belongs to the competence of this or that board. Such a state of affairs is known as disagreement in competence.

37. *Duties of boards.*—It is the duty of members of boards and their subordinates to fulfill their obligations conscientiously. They generally swear the oath of office, or a vow. Officers and their subordinates are responsible for their administration. Those in power over them can depose or punish them for a violation of duty. If they have wronged anyone, they must yield indemnity. Should they be guilty of a penal act, they are judged by the criminal court.

38. *The official language.*—The three national languages—German, French, and Italian—are permitted in interviewing State officers. In the Cantons it depends upon which language is predominant; in some there are two official languages.

39. *Places where boards meet.*—Boards meet within the territory under their control and where they act officially. The seat of Federal boards, with the exception of the Federal court, is Berne. Lausanne is the seat of the Federal court. Cantonal boards meet in the chief towns of the Cantons; district boards in the chief towns of the districts.

40. *The official press.*—The acts and laws of the above boards are made known to inferior boards and the people through the official press and official collections of laws. The Confederation has several official organs—the Federalist (Bundesblatt), the Official Trade Journal (Handelsamtsblatt), the Army Record (Militärverordnungsblatt), etc.

B.—Federal Boards and Officers.

1.—THE FEDERAL CONVENTION.

A.—In general.

41. *The two-chamber system.*—The Federal convention consists of two chambers, divisions, or councils—the National Council and the State Council. The National Council represents the people of Switzerland in general; the State Council represents the Cantons.

42. *Procedure.*—Each division of the Federal Convention manages affairs specially, excepting in certain cases when both chambers unite. Both councils meet at the same time in Berne. Sessions open in regular order the first Monday in June. The convention may assemble any time during the year, as necessity demands; it always meets for a several weeks' session during December. Neither council can adjourn or close its sessions unless the other does likewise.

The Administrative Federal Council defines the subjects for discussion and calls the councils to session. The presidents of both councils agree as to which chamber shall have priority in first discussing a certain affair; this agreement is submitted to their councils for confirmation. After a subject has been discussed in one council, it is referred to the other. If both chambers agree on all points, the question is decided; should objection be raised, the question is again referred to the first council. This action continues until the question is either decided by the agreement of both chambers or falls to the ground. The members of both councils have a free vote. Majority decides in all cases, though at least half of the members must be present to constitute a quorum.

The common session of both councils, with the president of the National Council as chairman, is called the Joint Federal Convention. It is called only to decide elections for the Federal Convention (the federal council, the federal court, the office of general), to exercise pardoning power, and to decide disagreements in competence between federal boards.

B.—The separate councils.

43. *The National Council.*—The National Council is elected by the people. One delegate is elected from every 20,000 inhabitants; a fractional number greater than 10,000 is likewise entitled to a delegate. Every canton and every half canton can elect at least one delegate. Federal legislation divides the larger cantons into electoral districts. The term of office in the National Council is three years. An entire change of membership occurs every three years on the last Sunday in October.

Every Swiss layman who has the right to vote is eligible to membership. The same person can not be a member of the National or State Councils and a federal officer at the same time. Members draw a salary of 20 francs per day; their traveling expenses are paid out of the public treasury. The president of the council can not hold office for more than one year.

44. *The State Council.*—This council consists of delegates from the cantons, 44 in number. Every canton elects 2 delegates, every half canton 1 delegate. Cantons are free to act in the manner of election. In some cantons members are elected by representatives of the people (cantonal council, great council); in others, by the people themselves. The cantons likewise decide upon the length of term and the salaries to be paid out of the public treasury. The president is elected for one year; the president of the ensuing year must be chosen from the delegates of another canton.

2.—THE ADMINISTRATIVE FEDERAL COUNCIL AND FEDERAL OFFICERS.

45. *The Administrative Federal Council.*—The Administrative Federal Council is the board of government of Switzerland, and is the highest executive and administrative power. It consists of seven members chosen for three years from among the members of the Federal Convention. Election is confirmed by the Federal Convention after the entire change of membership in the National Council during the December session; the term of office begins with the first of the following January. Only one member can be elected from among the voting citizens of one canton. A president acts as chairman, he has the title of president of the confederation, but he is not the president of the Republic as in France or in the United States. The president has no greater competences than the other members. He is chosen by the Federal Convention for one year, and is not eligible to the presidency or vice-presidency during the ensuing year. Every member is at the head of an administrative or executive department. The different departments are those of exterior, interior, justice and police, army, finances and taxes, industry, agriculture and trade, mail and railroads.

46. *Federal court of chancery.*—The Federal Council is assisted by the chancery, which attends to protocols and the carrying out of resolutions of the Federal Council and the Federal Convention, the keeping of the archives, the registry, and translation and publication of resolutions and laws; it is, in fact, charged with the superintendence of all affairs of chancery of the Federal Council and the Federal Convention. The head of this office bears the title of chancellor; he is elected for three years by the Federal Convention at the same time as the Federal Council. His occupation is to authenticate. He is assisted by two representatives (vice-chancellors) and the necessary officers and place men.

47. *Federal officers.*—All federal officers, excepting the chancellor, the general members of the federal court, and its court of chancery, are elected by the National Council for a term of three years. Officers are distinguished as assistants and place men. The Federal Council has the right to associate men of the learned professions.

3.—THE FEDERAL COURT OF LAW.

48. *Constitution.*—The federal court has been established for the exercise of judicial power as it pertains to the confederation. The number of members is determined by law, according to necessity; at present there are 16 members and 9 substitutes. They are elected for six years by the Federal Convention. In their election the three national languages are taken into consideration. Every voting citizen is eligible to membership. The court chooses its clerks. As it would be impracticable for the entire federal court to meet for all cases, different divisions transact different classes of affairs.

49. *Confederate assizes.*—There is also a confederate court of assizes. Every six years cantons elect their jurymen. When the court of assizes meets, the necessary number of jurymen are selected. The court of assizes is under the superintendence of the federal court.

C.—Cantonal boards and officers.

50. *Representations of the people.*—The highest cantonal power is vested in the cantonal council, also called great council or district council. It consists of delegates elected by the people, and transacts affairs of greater importance. Some cantons also have a communal council, of which any voting citizen may be a member.

51. *Governments.*—Cantons are governed by what is called a Government or State council. It consists of several members elected either by the people or the cantonal council.

52. *Officers.*—Officers are elected by the Government, the cantonal council, or the people. There are cantonal or district, town, and communal officers.

53. *Courts.*—Cantons have a superior court—called also cantonal court or court of appeals—district courts, or courts of justice, and besides criminal courts, or courts of assizes. In some cantons commercial courts are established to settle disputes in trade. Here and there industrial courts of arbitration are established to settle disputes between manufacturers and their clerks, hands, and apprentices. Throughout many cantons, moreover, justices of the peace decide minor cases and settle disputes.

D.—Political rights (people's rights).

54. *In general.*—The people cooperate in the administration and regulation of affairs of State as well as in legislation and elections. The rights of the people to cooperate in administration are called people's rights; the rights of individual citizens political rights, which consist of vote and eligibility to office. The State is divided into electoral districts. Elections are decided by majority or a relative or proportional vote, which latter method is affected by party numbers.

55. *Vote and eligibility to office.*—Every citizen above 20 years of age has a right to vote. Cantons can disenfranchise those under punishment of the law, bankrupts, those whose goods are distrained, paupers, and those under guardianship.

56. *The confederate vote.*—In confederate elections anyone can vote where he resides, and at once after he has delivered his certificate of citizenship. Registrations can not be closed earlier than three days before the time of election. No one can vote in two places at one election.

57. *Voting in the cantons.*—Every citizen of Switzerland can take part in the affairs of the canton and community in which he is, providing he has been living there for three months. Cantons, however, have the right to object to the voting of a three-months' resident, and can exact a longer time from mere sojourners (journeymen, servants, etc.). The right of vote in communities refers to political communities. In affairs purely civil and religious, only those can have a voice who belong to the civil or parochial district in question.

IV.—LEGISLATION.

A.—Legislation in General.

58. *The law.*—The law is the order of the State, to which officers and citizens must conform to avoid unpleasant results. The most important law, also called the fundamental law, is the constitution. Prescriptions, orders, decisions, and regulations, as well as signed political treaties, have the same effect as laws.

59. *Legislation.*—The constitution defines with exactness who, in every State, has the power to carry laws, decisions, and prescriptions into effect. Laws are first deliberated and then enacted. For the making of a law the decisions of several boards, or of one board and the people, are necessary. To be effective, laws must be made known to officers and the people. For this reason they are printed and published.

B.—Federal Legislation.

1.—THE CONSTITUTION.

60. *Total revision.*—A total revision of the federal constitution implies that every article is deliberated and a new constitution framed. The Federal Council or any single member of the Federal Convention can make a motion for total revision. If both chambers agree to the proposition, the question is deliberated. If one chamber agrees and the other dissents, a national vote decides. If an application for total revision has 50,000 signatures, the Federal Council must call a national vote. If the people decide in favor of it, both councils are renewed, and the newly elected councils must deliberate a new constitution, which is submitted to the people.

The revision agreed upon by the Federal Convention is submitted to the people. The new constitution is accepted, if the majority of voters and the majority of cantons are agreed.

61. *Partial revision.*—Partial revision implies the amendment of single articles of the federal constitution or the adoption of new articles only. The motion can be made by the Federal Council or by any member of the Federal Convention. If in this case only one council agrees, no national vote follows. The question simply falls to the ground. If both chambers agree upon partial revision, the new article is submitted to the vote of the people, and is accepted if the majority of voters and the majority of cantons are in favor.

The people can demand a partial revision directly by initiative. Fifty thousand signatures to an application necessitates the calling of a national vote on a proposed article. The Federal Convention can at the same time submit a counter proposition to the vote of the people.

2.—LAWS AND RESOLUTIONS.

62. *Kinds.*—The federal constitution distinguishes between laws and resolutions. Laws are more permanent; resolutions are temporary. They are generally or not generally binding, in so far as they apply to general or special conditions. Resolutions on the payments of money are not considered generally binding.

63. *Referendum.*—Laws and resolutions are enacted by the Federal Convention. As a national vote must always take place for a total revision of the federal constitution, as well as for an amendment or adoption of articles, in case of laws and resolutions it is called only when 30,000 inhabitants or 8 cantons so demand (facultative referendum). In voting on the constitution, a majority of voters and cantons is necessary for decision; on laws and resolutions a majority of voters suffices.

A referendum can not be had in cases of resolutions declared urgent though not generally binding, no more than in cases of political treaties (treaties with other States) ratified by the Federal Convention.

3.—PRESCRIPTIONS AND REGULATIONS.

64. *Significance.*—Laws are sometimes limited to the establishment of fundamental principles, and themselves provide to dispose details by means of prescriptions and regulations. These prescriptions and regulations must be definitely within the bounds of the law, of which they are but a closer application.

65. *Competence.*—The Federal Council is empowered to enact prescriptions and regulations. The federal court has the right of jurisdiction over debt and bankruptcy.

C.—CANTONAL LEGISLATION.

66. *Constitution.*—The constitutions of cantons, as well as amendments, are generally discussed and decided by representatives of the people (cantonal council, great council, district council). In some cantons a special committee, the committee on constitution, is elected for the sole purpose of totally revising the constitution. All new constitutions and amendments must, in accordance with the federal constitution, be submitted to the people for acceptance. Revised constitutions must, moreover, receive the consent of the Federal Convention. In many cantons the same right prevails as in the confederacy, that a number of qualified voters may claim a revision or a change in a specified point (constitutional initiative).

67. *Laws.*—In all cantons laws are primarily discussed and established by representatives of the people. In most cantons they are also submitted to popular vote (obligatory referendum). In some cantons a popular vote is called only when a certain number of qualified voters so demand (faculty referendum). In a few cantons the right obtains for a number of qualified voters to demand the enactment of a certain law or amendment (legal initiative). A few cantons have as yet no legal appeal (Freiburg, Wallis).

68. *Prescriptions.*—Cantonal governments have the right to enact prescriptions for the carrying out of laws.

V.—ADMINISTRATION.

A.—GOVERNMENT.

69. *Federal government.*—The Federal Council is the administrative head of Switzerland. It provides for the execution of the constitution and other laws, and gives the necessary directions. It prepares all the requisites for the Federal Convention. It protects the interests of the confederacy from without and guards interior security. The whole administration of the confederacy is in its hands.

70. *The governments of cantons* likewise administer interior affairs, dispose the requisites for a proper execution of the constitution and other laws, maintain peace and order, and direct and superintend the whole administration of State. They have no direct intercourse with foreign governments, but must solicit the mediation of the Federal Council.

B.—FINANCIAL SYSTEM.

71. *Federal financial administration.*—As finances affect the well-being of the whole State, their proper management becomes the first duty of the State. Expenses and receipts are determined a year in advance by means of specifications. The budget is prepared by the Federal Council, and submitted to the approval of the Federal Convention. All demands of the Federal Council must be indorsed

by the Federal Convention (additional credits). A member of the Federal Council is at the head of the department of finances. The chief receipts consist in duties. The postal and telegraph service also yield an income to the State. A direct tax is not levied by federal authority. The Federal Council turns in an annual account. This public account must be approved by the Federal Convention. The confederacy alone has the right to impose duties, arrange postal matters, and superintend the telegraph and telephone. Such rights are called monopolies or regalia. The production of alcohol is also a federal monopoly, from which, however, cantons receive some benefit.

72. *Financial administration in the cantons.*—In cantons, likewise, a yearly budget is laid before the representatives of the people for approval. The statement of public accounts likewise requires the approval of these authorities. Here and there a resolution of the people is necessary to incur greater expenses. The receipts of cantons are derived from dues which officers receive for functions (indirect taxes), or from direct taxation of property and income of the population. Frequently individuals are taxed without respect to possessions and profits (capital and household tax). As individuals of means can do more, even irrespective of their possessions, than the poor, the more recent tax laws are nearly all based upon the principle of progression. Inheritances are also taxed; in many places there still exists a stamp tax. Cantons can not levy duties or exact toll. The profits of the alcohol monopoly are divided among the cantons with respect to population; 10 per cent must be spent on the temperance cause (alcohol tithe). Cantons likewise receive one-half of the military tax for nonenlistment. Most cantons have made a monopoly of the salt traffic—that is to say, the canton alone has the right to introduce salt and control the market.

C.—The Military System.

73. *Nature of the Swiss military system.*—The military system of Switzerland is based upon the militia system. There are no standing regular troops, but every citizen is required to engage in actual service when summoned. If he is prevented by physical disability or any other cause, he must pay a military tax. The militia is a federal affair; cantons have hardly a voice in the matter.

74. *The Swiss army.*—The Swiss army is composed of the marching division, the landwehr, and the landsturm. The younger reserves belong to the marching division; the older to the landwehr. Such citizens as have never performed military service also belong to the landsturm. The Swiss army is locally divided into eight divisions. It has special laws for crimes and misdemeanors committed in service (military jurisprudence). In case of war the Federal Convention elects a commander-in-chief (general), whose powers are withdrawn at the close of the war.

D.—Education.

75. *In general.*—Every State must fulfill the important duty of properly educating its citizens, that they may maintain a position in the battle of life. Schools are divided into people's schools, secondary and higher schools. Cantons are obliged by the federal constitution to provide adequate primary instruction, which is compulsory. Children of a certain age are obliged to receive instruction, which must be so arranged that all of whatever creed they may be may benefit by it.

76. *Federal action.*—In accordance with the present constitution, the Federal Government pays little attention to educational matters. It supports the polytechnic school in Zurich, and has the right to found a confederate university, not yet begun. The Government allows appropriations for industrial, commercial, and agricultural schools and for schools of domestic economy.

77. *Activity in the cantons.*—Outside of what is done by the Federal Government, the cantons bear the whole burden of educational affairs. Single commu-

nities, or several smaller communities together, have one or more primary schools. Besides these there are general and technical continuation schools, district schools, classical and modern high schools, and universities.

E.—The Public Good.

78. *In general.*—As it is the duty of a State to promote the welfare of its citizens in every respect, the care of the public good embraces the various subjects of advancement of political economy, protection of the laboring class, promotion of health, preservation of nature, and encouragement of art and science.

79. *Advancement of political economy.*—The State is in duty bound to advance political economy; it should encourage production, trade, and commerce to the full extent of its power. For this reason, it endeavors to elevate the standing of the people by supporting expositions, by granting bounties for agriculture (subventions), by facilitating trade by means of uniform coins and measures, by financial aid in building dams, by encouraging industries through premiums, expositions, and elevation of apprenticeship, etc. The mail, telegraph, and telephone service should be managed for public benefit only; the question is being agitated to bring railways under federal control and to manage them for public interest. For the promotion of industry, inventions are protected by patent rights; manufactures are protected by trade-marks.

The importance of the different divisions of political economy has led to a distribution of administrative power among the departments of industry, agriculture, and trade, mail, telegraph, and railways. The same departments exist in the cantons.

80. *Protection of the laboring class.*—The State lends its support to the laborer so that he is better able to earn a livelihood. The wage earner needs the State's protection. Legislation for the benefit of the laborer is called labor laws. These apply to superintendence of factories in respect to hygiene, limitation of time, particularly during the night and on Sundays and holidays, prohibition of child-labor, and indemnity in cases of accident. The motion has been made to institute State benefits for the sick, etc.

81. *Promotion of health.*—It is primarily the duty of the individual to care for his health, but the State must assist.

The confederation takes precautionary measures against dangerous contagious diseases, so-called epidemics, as typhoid, cholera, smallpox, etc., and against epidemics among animals. Cantons are required to promote the public health by educating physicians, erecting hospitals and insane asylums, by free medical attendance and nursing of the sick, by superintendence of food, and severe measures against adulterations.

The communities extend the amplest means for preserving health by furnishing proper attendance in cases of sickness and accidents, by caring for the sick poor without pay, by furnishing good drinking water and discharging all injurious matter, by a strict superintendence of food, etc.

82. *Preservation of nature.*—It is well known how significant climate and soil are for the well-being of a population. Because of their important relations to weather, forests should be protected first in order; therefore, they and mountain waters are under the supervision of the confederation. Generally a special department in the cantons has charge of preserving forests. A special legislation and supervision obtains for the protection of fish, birds, and other game, as much for sparing the animals themselves as for the benefit which man derives from them.

83. *Encouragement of art and science.*—Art and science should receive attention from a nation; therefore a State should do all in its power to encourage them by establishing public collections and libraries, by purchasing works of art, etc.

84. *Expropriation.*—The State recognizes the property of an individual from principle and protects it against unjust seizure. But when the public good demands it, as in the construction of public buildings, railways, canals, and reservoirs, the individual must give up his property, even against his will (expropriation, condemnation).

F.—Other Branches of Administration.

85. *Justice.*—The department of justice prepares laws relating to penalty and private rights; it superintends all judiciary action, and proposes measures for improvements and remedying evils; it decides questions of complaints rendered, and supervises the civil and commercial register. The confederation and individual cantons here separate the departments of justice.

86. *Police.*—The department of police protects individuals and possessions. The police must see that strangers threatening the security of the State from without or within quit the country, and that criminals are brought to law. The confederation and cantons have separate departments of police. Communities must provide a proper police force. The fire police is a community affair.

87. *Poor laws.*—The maintenance of the poor is particularly a cantonal affair, which is transacted by communities. Different arrangements exist for the support of the poor. In some cantons the needy are provided for by the canton in which they live (local support); in others their support is an affair of their native community. In cases of extreme necessity, however, the community in which they live must provide temporary relief, and burial in case of death.

88. *Guardianship.*—The laws of guardianship are cantonal affairs, primarily administered by communities. In every canton there exist supervisory boards.

89. *Communities.*—The supervision and administration of communities is under the cantonal governments, which have special departments for this purpose (the interior).

VI.—RIGHTS AND DUTIES OF INDIVIDUALS.

A.—Individuals.

90. *Personality.*—Every inhabitant, be he an adult or child, is capacitated for rights and duties; consequently, everyone is qualified to be under law; but rights and duties belong to a number of persons forming a collective unit under a special name, as, for instance, communities, societies, guilds, and unions. So we speak of them as individuals by law.

91. *Independent action.*—Even though rights and duties belong to mankind in general, not everyone is able himself to acquire and establish them. The ability to do so, called independent action, begins at the close of the twentieth year of age, the time of legal maturity. Minors are bound to the consent of parents and guardians. When those of age are under guardianship, because of mental or physical incapacity, they are deprived of independent action. It is evident that the insane are incapable of acting legally. In some cantons minors above 18 years of age can execute wills.

Political rights, the right to vote, and eligibility to public office begin with the completion of the twentieth year of age.

92. *Responsibility for injuries.*—Anyone, in so far as he is accountable, is responsible for an intentional injury to others or one that results from negligence. Accountability is a question of age and intellectual ability. It may begin as early as the twelfth year of age; with undeveloped children it begins later. After consideration of all circumstances, the judge decides the question of accountability. The responsibility for forbidden acts is twofold. On the one hand damages are repaired by money, and on the other hand, if the act is forbidden by statute, the culprit is also punished.

93. *Representatives of individuals.*—Incapacitated persons need a legal representative, who, when necessary, acts for them. A father, or, if he be dead, a mother or guardian, is a legal representative. Individuals by law likewise have their representatives (administrators, directors, etc.). A power of attorney gives one person the right to act in the place of another. Political rights alone are not transferable.

94. *Sex.*—With rights and duties, no distinction is made between the sexes. Political rights form an exception. Women are not allowed to vote, and are not eligible to public office.

95. *Merchants.*—A merchant is one who carries on, or controls the management of, a commercial or manufacturing business. Merchants must be enrolled in the commercial register. They are subject to bankrupt laws for debt.

96. *The civil register.*—The relations of a person with respect to birth and name determine his civil position, which is recorded in the civil register. In recording births, the Christian name and surname, the names of parents, and place of birth must be mentioned. Deaths are similarly registered. Marriages are likewise recorded.

97. *The commercial register* is kept for the purpose of acquainting the public with the formation and representation of mercantile firms, that they may have full confidence in the statements given.

B.—Public Rights and Duties.

98. *Summary.*—Public rights and duties are those of individual citizens with respect to State authority. They are defined principally by the federal constitution; some are guaranteed by the cantonal constitutions. Public rights, also called individual rights or rights of liberty, are a claim to equality before the law, free residence, the liberty to engage in any industrial or commercial pursuit, the liberty of petition, the liberty of union, the liberty of the press, free worship, liberty of conscience, and the political rights already mentioned. Public duties are enlistment in military service and payment of taxes.

99. *Equality before the law.*—All citizens are equal before the law; no distinctions can exist that wound republican feeling. Everyone has the right not to be treated arbitrarily and to have his cause heard by State authorities.

100. *Residence.*—One of the most important liberties is the right of free settlement. Every citizen may live where he pleases, provided he have a certificate showing that he is a native of Switzerland. The right of residence can be refused or withdrawn only for bad conduct or dependence upon public charity.

101. *The liberty of industrial and commercial pursuits.*—Fundamentally, everyone can engage in any industry according to pleasure. Formerly, in the time of guilds, things were different. The liquor traffic forms an exception. This industry is dependent upon a permission (license or concession) which is given only in necessity and upon the receipt of proofs for definite requirements. Other industries are subject to certain restrictions, as pharmacy and the manufacture of inflammable and poisonous substances; just so the practice of certain professions, as those of lawyers, physicians, and teachers, are dependent upon certificates.

102. *The liberty of petition, of union, of assembly, and of the press.*—Every citizen is allowed to refer a proper cause to State officers (the liberty of petition). Citizens are likewise allowed to form unions, even political, which are forbidden in monarchies (the liberty of union), and to call meetings at pleasure (the liberty of assembly). The liberty of the press consists in a free and candid expression of opinion, which, however, must incur no breach of honor.

103. *Free worship and liberty of conscience.*—Free worship and liberty of conscience is one of the most beautiful and valuable principles. It consists in everyone's being permitted to live up to his religious convictions without fear of persecution.

C.—Penal Laws.

104. *In general.*—Every State has laws the violation of which entails not only responsibility for the damage done but punishment also. According to their weight, punishable acts are crimes, offenses, or mere misdemeanors. Punishments are either losses of money or liberty. In some cantons, crimes exceptionally great, like murder, are punished by death. The severest forms of loss of liberty are the penitentiary or incarceration, the workhouse or imprisonment. The instigators and accomplices are punished as well as the perpetrators of a crime. Punishment naturally presupposes accountability. Whoever acts out of self-defense is exempt from punishment; the transgression, however, is punishable. If a guilty party has not been prosecuted during a certain length of time, the punishment of the offense is prescriptive. The penal prescriptions are contained in several of the federal laws, but principally in the cantonal penal-law books. The confederation has penal prescriptions for crimes against the confederation and confederate authorities, as well as for transgressions against federal decrees. Cantons define the prescriptions for other crimes, offenses, and transgressions.

105. *Crimes and offenses against the State and its officers.*—High treason, namely, acts designed against the independence of the fatherland, is the greatest possible crime. Other crimes are unjust attacks on State authority, disobedience against official commands, etc.

106. *Crimes and offenses against life and health.*—The greatest crime in this respect is murder, which is the deliberate and intentional killing of anyone. Manslaughter is the killing of a man, possibly voluntarily, but without deliberation, in the heat of excitement. If a man be wounded without intent to kill and death results, it is called a wound of fatal issue. Corporal injuries are called wounds. They are divided into severe and light wounds. Only a mild punishment is given in cases of death or wounds inadvertently caused.

107. *Crimes and offenses against property.*—The most frequent crime against property is theft—the unjust appropriation of another's belongings. The value of the goods and the manner of perpetrating the theft affect the culpability of the act. Housebreaking, entering premises, and the use of weapons aggravate the offense. If theft is committed by using force or threats, it is called robbery. Embezzlement is the appropriation to our own use of another's goods committed to us for safe-keeping. The acquisition of advantages by intentional deception is fraud. The gaining of advantages by threat is extortion. The destruction and injuring of goods (defacement) is likewise punished; its worst form is arson. Whoever buys or secretes goods which he knows or has reason to believe have been stolen is punished for the concealment of stolen goods. Counterfeiting money and falsifying titles are also crimes against property.

108. *Crimes and offenses against honor and morality.*—Calumny is an intentional harm done to another's honor or credit by false reports. Insults are expressions against anyone's honor. Immoral actions are punished by law.

109. *Other offenses and transgressions.*—Besides what have been mentioned, there are a number of prescriptions, the violation of which entails punishment. Various penal decrees relate to food, the chase, fishing, etc. There is hardly a law that does not contain some penal decree.

D.—Civil Laws.

110. *Introduction.*—Civil laws, also called common laws, include the relations of the citizen with respect to family and possessions and determine the rights and duties which proceed from the family and intercourse. Civil laws are divided into laws of family, laws of goods, laws of obligations, and laws of inheritance. Almost all but the laws of obligations are defined by cantonal legislation. The laws of obligations are included in a special federal law.

111. *The laws of family.*—The family consists of parents and their issue. It is founded by the making of marriage vows. For a marriage to be legal the groom must be 18 years and the bride 16 years of age. Minors must have the consent of their legal representatives. Mental disease, an already existing marriage, close relationship, or affinity by marriage are obstructions. Before the marriage is confirmed it must be announced by the civil officer; afterwards the religious ceremony may take place. The marriage is annulled if hindrances exist—an existing marriage, relationship, etc. There can be a divorce on valid grounds.

By marriage a woman enters upon a relation to her husband also with respect to her possessions; this is called the marital property relation. In most cantons the husband accordingly has the right to administer his wife's possessions in so far as the wife has not reserved her right by contract. If the husband becomes bankrupt, his wife is a preferred creditor for the half of her possessions.

Parents have the right, and it is their duty, to educate their children and provide for them. It is the duty of children to care for their poor parents. In some cantons parents without children can adopt strange children.

Guardians are appointed over orphans, as well as those of majority who need supervision on account of being spendthrifts or mentally or physically disabled.

112. *The laws of goods.*—Goods are objects which belong to trade. They are movable or immovable; movable goods are called wares; immovable goods are grounds and buildings. Ownership implies the full legal right to goods. It is acquired by purchase, exchange, gift, inheritance, or long-continued possession (limitation). The right to use strange immovable goods, or render them serviceable in a definite direction, is called the right of service, as, for instance, the use of grounds, the right of roads, etc. If goods are held only as a security for a claim, the possessor is called a mortgagee.

Whilst the exchange of movable goods is easily effected, the legal relations of fixed property are often defined with difficulty. For this reason the records (Grundbücher) have been instituted, in which the titles of property are registered.

113. *Laws of obligations.*—Obligations are responsibilities for debt. As a rule, they arise from contracts, as agreements for purchase, rent, lease, and service. They also arise from forbidden negotiations, whereby the one at fault becomes indebted for indemnification. Different forms of proofs for claims and debts, specially designed as evidence, are notes, bills of exchange, and checks.

114. *The laws of inheritance.*—The possessions of anyone deceased fall to his relations; if there be no immediate family, they are divided among his brothers and sisters, or more distant relations. A man has the right to will his possessions at his own pleasure; his near relations, however, can not be totally ignored; they have the right to a certain legacy by law. If there are no near relations, and there is no will, the inheritance reverts to the communities or to the cantons.

VII.—THE JUDICIARY SYSTEM.

A.—In General.

115. *Duties of the judiciary department.*—It does not suffice for State legislation to define rights; it must also provide for their maintenance and protection. This is done by the judiciary, whose power is primarily vested in the courts. The administrative power is also called upon to support rights in certain directions (administration of justice).

116. *Procedure.*—The process in a lawsuit is a series of acts and investigations countenanced by the judiciary and superintended by a judge. The chief feature is the opportunity for expression given to both parties. The proceeding concludes with a decision or sentence. The sentence must then be carried out (execution).

According to the rights to be protected, we distinguish the systems of public law, penal law, and civil law.

B.—The System of Public Law.

117. *Disagreement in regard to public law.*—Different State boards may differ in opinion on competences; or an individual citizen may feel that his public rights have been infringed upon. If boards have different views as regards their competences, we speak of disagreements in competences. If federal boards disagree, the Federal Convention decides; if the confederation and cantons, or the cantons themselves disagree, the federal court decides. The federal court or the Federal Council decide disagreements between citizens and federal boards.

118. *The right of appeal.*—If a citizen believes that any public right granted to him by the federal or cantonal constitution has been infringed upon, he can hand in a writ of complaint against the offending board to the federal court (right of appeal). In cases of infringement on political rights and the liberties of commerce and industry, the appeal must be made to the national council.

C.—System of Penal Law.

119. *The system of penal law in the Confederation.*—The milder violations of penal decrees contained in federal laws are passed over to the cantonal courts of trial. Graver violations are tried by the federal court, which even acts in conjunction with the court of assizes for judging certain crimes, as high treason, rebellion, and violence against federal authority and political crimes and offenses that occasioned federal intervention.

120. *The system of penal law in the cantons.*—The method of procedure in determining crimes and offenses and judging the guilty is different in the different cantons. Milder cases are tried in the lower courts; graver cases, in the so-called criminal courts or courts of assizes. The charge is usually brought forward by the State's attorney, a lawyer officially appointed, who founds the charge and decides upon a right of appeal to a higher court. The accused is allowed to have a defendant; in weighty cases he is provided with a defending attorney.

121. *System of military penal law.*—A court-martial tries crimes and offenses committed in service, as has been already mentioned. Every division has a military court composed of officers and soldiers.

D.—System of Civil Law.

122. *System of civil law in the cantons.*—Minor suits are usually settled by individual judges. Serious cases are taken before district courts (the first instance), and upon appeal of one party, to superior courts for sentence. The method of procedure is not alike in all cantons. In some cantons the parties deliver their charges and causes verbally; in others they must hand in writs of complaint and defense.

123. *The federal court in connection with civil law.*—The federal court judges only certain cases of civil law.

Certain suits can and must be brought directly before the federal court without consideration of cantonal courts. To this class belong civil suits between the confederation and cantons or between cantons, independent of the worth of the cause; suits between private parties or corporations as plaintiffs and the confederation as accused, provided the cause of dispute is estimated at 3,000 francs at least, suits between a canton on the one hand and private parties or corporations on the other, provided the cause of dispute is valued at not less than 3,000 francs and one or the other party demands it; finally a series of suits affecting railways, so-called emission banks, patents of inventions, and telegraph and telephone lines.

The federal court furthermore decides all cases that have been previously judged in cantonal courts from which an appeal has been made to the federal court. An appeal can be granted only when the dispute is to be decided according to federal laws; therefore principally in cases of obligations and when the cause of dispute is valued at not less than 2,000 francs.

124. *Prosecution for debt and bankruptcy.*—If anyone has an indisputable claim; consequently a claim entitled to legal judgment or the proof of a debt, he can prosecute the one unwilling to pay for debt. If the debtor is mentioned in the commercial register, this action leads to bankruptcy; otherwise to distraint. In cases of distraint goods are taken and sold by auction until the sum of the claim has been realized. In bankruptcy, all the possessions of the debtor are sold at auction, and all creditors invited to make good their claims. In distraint, as well as in bankruptcy, the most necessary articles must be left to the debtor. Prosecution for debt and bankruptcy are regulated by federal law.

VIII.—Position of the Confederation with Respect to Foreign Countries.

125. *Summary.*—The separate States or cantons can not act independently; it is a well-understood advantage for them and the population to foster their relations to one another. These relations can be of a political nature and be expressed in alliances with foreign States, or they can be directed to the friendly intercourse among the States by reciprocal ambassadors and consuls as well as by international treaties.

126. *Political situation of Switzerland.*—Switzerland has always followed out the principle of not interfering with the political conditions of other States and strenuously maintaining a policy of neutrality. The neutral position of Switzerland was defined by it, and the great powers of Europe, during the congress at Vienna in 1815, guaranteed it. In consequence of its strict neutrality, the confederation offers an asylum to all political fugitives, who are allowed to remain as long as they do not abuse the privilege.

127. *Ambassadors and consuls.*—For the maintenance of the friendly relations existing between Switzerland and the larger States, as well as for the protection and assistance of Swiss residents, Switzerland sends ambassadors or ministers to Paris, Vienna, Berlin, Rome, and Washington. It sends consuls to all the important cities of the world. Their office is to transact business affairs and counsel and assist their fellow-citizens. On the other hand, foreign countries send ambassadors or ministers to Switzerland; in all its large cities foreign consuls reside. Ambassadors and their personnel enjoy the right of extraterritoriality—that is to say, their judicial relations are the same as in their own country (taxes, legal prosecutions, etc.). Consuls must be recognized by the Government of the country to which they are sent; this recognition is called "exequatur."

128. *Treaties for residence and trade.*—Treaties for residence exist between Switzerland and most other States. In accordance with these, Swiss citizens and the citizens of other States may reside in the respective countries and enjoy the protection of their laws. They can carry on business the same as native citizens, and can not be deprived of these rights without cause.

129. *Treaties on important matters of law.*—It frequently happens that the legal prescriptions in one country might conflict with those of another. It is necessary to establish uniform legal prescriptions, especially for industry, trade intercourse, and legal proceedings. This is accomplished through the so-called international conventions. These have been held to decide upon postal, telegraph, railroad, freight, patent, and art and literary copyright laws. The States which have been represented at these conventions maintain special bureaus, so-called international bureaus, located at Berne.

130. *Treaties referring to import duties.*—States levy a duty on imported goods, partly for revenue and partly to raise the prices of such articles so that home industries may prosper (protective tariff). If the interests of every State were isolated, commerce would not only be prevented but be rendered practically impossible. Therefore, States endeavor to derive advantage from mutual concessions. Switzerland has signed treaties of this kind with all neighboring States.

131. *Extradition treaties.*—Criminals often try to evade justice by taking refuge in other countries. States have, therefore, negotiated treaties for the return of such fugitives. Political offenses are not included in these treaties; they are those which are not committed from motives of gain and the like, but to give expression to political views. Switzerland and most other countries do not return a citizen who has committed a crime in another country, but themselves inflict the punishment.

THE TEACHING OF CIVICS IN FRANCE.

In the French elementary schools "civil government" is a subject of study, and the topics to be treated are prescribed explicitly. The following outline is submitted as showing what is required. Children of the age of 7 to 9 years are made acquainted, by means of informal explanations in connection with reading, with words suggesting national ideas, as citizen, soldier, army, native country, community, department, nation, law, justice, public force. Children from 9 to 11 years of age are given general notions of the organization of the State, the duties and rights of citizens, compulsory education, military service, taxation, universal suffrage, the community, the mayor and the municipal council, the department, the prefect and the general council, the State, legislative, executive, and judicial power. During the last two years of the course the teacher discusses more thoroughly the political, administrative, and judicial organization of France; the constitution; the President of the Republic; the Senate; the Chamber of Deputies; the law; departmental and communal administration; the different authorities; civil and penal courts; the different degrees of instruction; public force; the army.

In the superior elementary schools this course is extended to include elementary ideas of political economy: Elementary notions of civil law (the family and the civil state, the laws of property, inheritances, contracts) and of commercial law (merchants, commercial societies, bills of exchange, orders, checks); production of wealth; factors in production (material, labor, economy, capital, property); circulation and distribution of wealth (exchange, money, credit, wages, and interest); luxury; expenses of the State; taxes and the annual appropriations.

In order to more clearly define the subject, particularly to show the terminology employed, an English version of a little text-book is here inserted which is used in the lower schools of France. Its author is M. S. A. Nonus, inspector of elementary schools and officer of public instruction in France.

I.—Society—The State.

Man is a social being. The foundation of society is the family.

Several families living in the same neighborhood form a commune; several communes, a canton; several cantons, an arrondissement, and several arrondissements, a department—and the departments, collectively, form the State.

A State is a territory the inhabitants of which obey the same laws and recognize the same power, the same authorities—or, in a word, are under the same government.

II.—Benefits of Society.

"One man can do very little alone; uniting his efforts to those of others, he can accomplish great results."

We are indebted to society for—

(1) Material advantages. We enjoy not only the fruit of our own labor, but also that of the labor of others.

(2) Intellectual advantages. Were it not for society, man would remain in a state of ignorance, as upon each individual would be entailed the nearly impossible task of starting again at the very beginning of all that has been done. As it is, each profits by the efforts of all. Generations bequeath an intellectual inheritance to one another. This constitutes progress.

(3) Moral advantages. Isolated from his fellow-creatures, man would become fierce, savage, and wicked. In contact with others, his manners soften and moral progress develops.

III.—Government—Constitution.

Government is the collective powers that administer public authority. The constitution is the fundamental law of a State. It defines the form of government and the political rights of citizens. France is now ruled in accordance with the constitutional laws of 1875.

The principal forms of government are monarchies and republics. In a monarchy, be it a kingdom or an empire, the monarch exercises power as a personal right, transmitted by succession. When his authority is not limited by a constitution, the government is an absolute monarchy. When his authority is defined by a constitution, the government is said to be constitutional.

The word republic means a public thing or affair—the government of all. A government is said to be democratic when the power resides ultimately in the whole people.

Observation: France is a democratic Republic, one and indivisible. Switzerland is a federative Republic.

IV.—Monarchy and Republic—Comparison.

A republic is the only form of government compatible with universal suffrage or national sovereignty. It is preferable to a monarchy because the people conduct their own affairs instead of submitting blindly to a man who is able to place his own interests and those of his dynasty above national interests.

The heir of a good king may be incapable of governing; whereas the president of a republic is always elected from among the most able.

Observation: In a republic men are free citizens, whilst in a monarchy they are but the very humble subjects of the king or emperor.

I.—Race—Nation—People.

A race is composed of the descendants of common ancestors, from whom they inherit certain moral, intellectual, and physical qualities. The Gallic race and the Germanic race, for instance, may be mentioned.

A nation or a people is a body of inhabitants of the same country, speaking the same language, and having common interests and the same history.

The words French nation, French people, mean all the inhabitants of France, without distinction of race.

II.—French Citizenship.

A French citizen is one who enjoys political rights in France. To enjoy these rights one must have attained to the age of 21 years, be French born, or have become naturalized.

The following forfeit their political rights:

(1) Those who have suffered penal retribution and ignominious punishment—or the latter only.

(2) Those who have been deprived by law of their right to vote and election. Consult the table of those incapacitated to vote, published by the minister of the interior, July 12, 1874. Also, consult Municipal Life, by S. A. Nonus.

Observation: Whoever does not love France, or commits wrong, should be struck off the list of French citizens.

III.—How one Becomes and Ceases to Be a French Citizen.

The following become French citizens:

(1) The foreigner who marries a Frenchman.

(2) Foreigners who have been naturalized.

On request for naturalization, it is enacted by law, after proper inquiry.

The following are no longer French citizens:

(1) The Frenchman who becomes naturalized in a foreign country.

(2) The Frenchman who, without authority from the Government, enters a foreign military service or accepts public office under a foreign government.

Observation: Foreigners should not receive the title of French citizen unless they are truly deserving.

IV.—Rights Guaranteed to All Citizens.

French citizens enjoy a certain number of rights, defined in the article on rights of man and of citizens. These rights may be divided into three categories:

(1) Individual rights, guaranteed to all men, women, and children.

(2) Civil rights, allowed to men and women of age.

(3) Political rights, allowed only to men of age.

Refer to the lesson on the Rights of Citizens. Notice that the rights to be discussed in the next lesson are the counterpart of the duties spoken of in the lessons on morals.

Observation: Let us be proud of being French citizens and vigilantly guard our rights.

First. The right of property: The right of property is the right to possess what one has acquired by work, inheritance, or donation. The owner may dispose of his effects as of his person. "Property is an inviolable and sacred right, of which one can be deprived only when public necessity, legally defined, so requires, and then only under the condition of a just and previous indemnity." This is called renunciation for the cause of public necessity.

Reflection: Every citizen should respect the property of others.

Second. The right of vote—Universal suffrage: Civic or political rights are the rights granted to citizens of age in their relations with the State; as, the right to serve as a witness; the right of oath: the right to vote.

Universal suffrage is the right common to all French citizens to take part by vote in the election of those appointed to govern or represent the nation, department, arrondissement, or commune. To be able to vote, one must be 21 years of age and enjoy his civic rights.

Refer to lesson 4. A tax must be voted by the representatives of the nation. A citizen need not pay even a centime unless the tax has been legally voted.

Reflections: The right to vote imposes the duty of knowledge. Since all profit

by public expenditure, it is just that each should contribute to it according to his means.

Third. National sovereignty: The principle of all sovereignty rests essentially in the nation. No individual nor body of men can exercise authority unless it has been so decreed.

The French nation is free and is its own mistress.

Sovereignty is exercised by the right of vote, that is to say, the right to nominate representatives or mandataries for the different elective officers, as deputies, senators, and others.

Reflection: All power is vested in the people; they alone are sovereigns.

I—Duties Imposed on all Citizens.

Refer to the instruction on morals. Pupils should review this lesson.[1]

II—The Obligation of Education.

Law of March 28, 1882. Primary instruction is compulsory for children of both sexes aged from 6 to 13 years. Children should either attend primary or secondary educational institutions, public or private schools, or be taught at home, by the father of the family himself or some other competent person. In pursuance of the obligation, the law has established free primary schools.

The father of the family is free to have his children instructed as he chooses, but the law will not permit them to grow up in ignorance.

In each commune commissioners of education are appointed to superintend and encourage attendance at schools. Penalties are imposed upon negligent parents. Children instructed at home undergo an examination at the end and at the beginning of the scholastic year.

Reflection: Parents have no more right to deprive their children of education than of bread.

III.—Organization of Public Instruction.

In France there are three degrees of public instruction.

(1) Primary instruction: The classes of primary schools are infant schools for children 2 to 6 years of age, infant classes for children 4 to 7 years of age, elementary primary schools, complementary classes, and superior primary or high schools.

(2) Secondary instruction: The classes of secondary schools are lyceums and colleges, with secondary and secondary-modern courses.

(3) Superior instruction: The classes of higher schools are the faculties of literature, sciences, law, medicine, and pharmacy. They also comprise what are known as special schools, as the Military School of Saint-Cyr, the Polytechnic School, and the National University.

Reflection: Owing to the beautiful institution of the scholarship funds, or bourses, a child of the poorest workman can, by intelligence and courage, pursue the highest courses of study.

IV.—Functionaries of Private Instruction.

(*a*) Instruction: Infant schools are under directresses and assistant directresses; elementary primary schools, under instructors and instructresses, full titled, and those not yet graduated; high schools, under directors, professors, and assistants—male and female.

---

[1] The text here offered in translation is the second part of Professor Nonus' text-book. The first part contains the matter for instruction in morals or ethics. It is the first part (here omitted) to which the author refers from time to time.

(*b*) Superintendence and inspection: Superintendents of schools are as follows: Commissioners of cantons, commissioners of inspection, inspectresses of infant schools, primary inspectors, academy inspectors, the rector, inspectors-general, inspectresses-general for infant schools.

The prefect, by advice of the academy inspector, appoints the full-titled teachers, male and female. He presides over the departmental counsel occupied with affairs relative to primary instruction in the departments.

Reflection: The functionaries of primary instruction are well-instructed persons devoted to children.

MILITARY SERVICE.

I.—Necessity of this Service.

Though an evil, war is sometimes necessary. Should France be attacked, it must be defended; but we can not defend it efficaciously merely by taking a gun in hand and marching against the enemy. We must be prepared by military service. As military service has been constituted for the defense of our common mother, it is just that all Frenchmen should be obliged to serve. To serve one's country is not only an obligation, but it is also an honor, and no individual punished for any dishonorable act is allowed to serve in the French army.

Reflections: For a successful defense of our country, we must be prepared by military service. A good pupil will certainly be a good citizen and a good soldier.

II.—Enlistment—Board of Inspection.

The following two principles govern the recruitment of the army:

(1) The obligation of military service devolves upon all.

(2) The full term is twenty-five years.

At the beginning of every year the mayors of each commune take a census of the young men who completed the twentieth year of their age the year before. The enlistment takes place in the chief town of every canton at a public meeting presided over by the subprefect.

The board of inspectors is presided over by the prefect or the secretary-general. It likewise meets in the chief town of the canton.

Young men disqualified by any infirmity are exempted from military service. Dispensations are also granted to certain classes of conscripts, but only in time of peace. Those dispensed are obliged to pay a military tax.

Reflection: It is an honor to serve our country.

III.—The Active Army—Reserves—The Territorial Army—Auxiliary Agencies—The Marine—Military Decorations.

Every Frenchman enlisted serves successively in the active army for three years, the reserves of the active army for ten years, the territorial army for six years, and the reserves for the territorial army for six years. The term of service begins with the 1st of November in the year of enlistment.

The French army consists of (1) infantry, (2) cavalry, (3) artillery, (4) engineer corps; and the auxiliary service is attached to this main body, as (*a*) quartermaster's department, (*b*) medical service and ambulances.

The navy is recruited from the naval conscriptions, by volunteers, or from the first members of the contingent.

The military decorations are (1) the military medal, (2) the Legion of Honor, (3) commemorative medals.

Reflection: Formerly the nation had an army; now the whole nation is armed.

IV.—Military Discipline—Infractors.

Discipline is immediate voluntary obedience to the orders of superiors, who command only what the laws and regulations prescribe. Discipline is one of the greatest forces of the army.

Courts-martial are special tribunals held for the judgment of crimes and misdemeanors committed by any member of the military organization. A court-martial consists of members of the army. It is composed of six officers and one subordinate officer.

An infractor is one who evades the law of recruitment; a deserter is one who leaves his regiment without permission. Both are punished by law.

Reflection: Military discipline is severe, but it is the duty of a soldier to submit to it for the love of his country.

TAXES.

I.—Necessity of Taxes—Direct and Indirect Taxes.

(Refer to the duties to our country, and the right to vote—taxes.)

Taxes are the contributions of every citizen toward the expenses of State, department, or commune for public services. The army, the marine, public works, public institutions, and so on, are the public services for which the larger part of the taxes is spent. All these services are necessary, even indispensable, and they entail enormous expenditures; hence the necessity for taxes.

There are two kinds of taxes, direct and indirect taxes.

The taxes on land, personal property and chattels, the tax on doors and windows, the tax on patents, the military tax, the taxes on horses and carriages as articles of luxury, on wheels, billiards, etc., are direct taxes.

The principal indirect taxes are those on drinks, sugar, coffee, etc.

Monopoly is the right reserved by the State for manufacturing and selling certain products, such as tobacco, timber, gunpowder, etc.

There are also duties and city toll.

Reflection: To support the public offices and defray the expenses of administration a common contribution is indispensable. (Consult On the Rights of Man and Citizens.)

II.—Budgets.

The budget is a statement of the probable receipts and expenses of a country, department, commune, or public administration.

The budget of the State is examined and voted each year by the Chambers. The budget of receipts determines the different rates of taxes to be raised. The total direct taxes are divided among the departments and then among the communes.

The budget of the departments is voted by the general council. The budget of communes is voted by the municipal council and approved by the prefect.

Reflection: Colbert was the first to conceive the excellent idea of making out a budget, or yearly statement of receipts and expenses.

III.—Financial Administration.

A taxgatherer collects the direct taxes.

In the chief town of every arrondissement a special collector takes charge of the amounts handed in by the taxgatherers.

The special collectors pass their funds over to the general treasurer of the department.

The financial board and the councils of prefecture verify the accounts of the administrations of State and commune.

The minister of finances is at the head of the financial administration.

Reflection: Order in finances is indispensable to the prosperity of a State.

ADMINISTRATION.

I.—Commune—Municipal Council—Budget.

A commune is the smallest political division of finance. Each commune is governed by a mayor, aided by one or more assistants and a municipal council.

Municipal councils, the number of which varies from 10 to 36 according to population, are elected by ballot for four years. They must be 25 years old. They meet in ordinary session four times a year; but extraordinary sessions may be convened.

The municipal council nominates the mayor and assistants. It considers all affairs of interest to the commune and nominates one or more senators. It votes the budget of the commune. "The expenditures of the commune include principally the expenses of communal administration, the maintenance of roads, public buildings, and loans." (Ch. Dupuy.)

Reflection: The administration of the commune is not independent; it is under the authority of the prefects, agents of the central power.

II.—Mayors and Assistants.

The mayor is the first magistrate of the commune. In case of absence or hindrance, his place is filled by the first assistant or any other. In large cities the mayor can delegate his authority to the assistants for the exercise of a number of municipal functions.

The power of the mayor is extensive. He is a civil officer and chief of the municipal police force. He is the agent of the executive power and executes the decisions of the municipal council. He proposes the budget and orders the expenses. He nominates a certain number of municipal officers, and represents the commune in its affairs of interest. He frames resolutions on subjects pertaining to his administration.

Reflection: The mayor is at the same time an officer of the commune and a representative of the State.

III.—Arrondissement—Department—Subprefect—Prefect—Council of Prefecture.

An arrondissement is governed by a subprefect.

The subprefect serves as intermediary between the prefect and mayors. He rules the administrative affairs of the arrondissement and presides at enlistments, etc.

A department is governed by a prefect, who is at the same time the agent of the Government, the representative of the department, and the warden of the communes.

As agent of the Government, he superintends the execution of the laws, nominates certain officers, frames resolutions, etc.

As administrator of the department, he executes the decisions of the general council, prepares the departmental budget, etc.

As warden of the communes, he approves the budget, controls the expenses, examines contracts of purchases and sales, constructions, etc.

The council of prefecture is an administrative tribunal. It examines the accounts of communes and charitable institutions, the income of which can not exceed 30,000 francs. It judges disagreements of communes, decides municipal elections, etc.

Reflection: France has been divided into departments since 1790. The administration of departments is based on that of the State.

IV.—Council of the Arrondissement—General Council.

The council of the arrondissement is composed of as many members as there are cantons in the arrondissement, though they must number at least nine. It meets twice a year. It distributes among the communes the direct taxes imposed on the arrondissement by the general council, advises the creation of markets and market places, decides questions of local interest, etc.

The general council is composed of as many members as there are cantons in the department. The councilors are elected for six years, though half are changed every three years. The general council considers all affairs concerning the department. It advises, by request, communal affairs and the councils of arrondissement, and issues opinions on all questions of interest to the department. Members of the general council are senatorial electors. To represent it during sessions and to regulate current affairs, the general council elects from among its members a commission entitled "departmental commission," which meets at least once a month.

Reflection: The general council is, so to speak, the municipal council of the department.

I.—The Constitution—Public Powers.

The public powers are organized as follows:

(1) The legislative power, vested in the Chamber of Deputies and in the Senate.

(2) The executive power, possessed by the President of the Republic and the ministers.

(3) The judiciary power, whose sphere it is to punish violations of the laws and to decide controversies. This power is vested in the courts.

These three great powers are distinct from one another and can not be in the hands of one person. This is what is known as the separation of the powers.

Reflection: The separation of the powers is the guaranty of the liberty of citizens.

II.—Legislative Powers.

1. *The Senate.*—The Senate is composed of 300 members. No Frenchman can be a senator unless he is at least 40 years old and enjoys civil and political rights.

Senators are elected by ballot and by universal or restricted suffrage. The senatorial electors are as follows:

(1) The deputies of the departments.

(2) Members of the general council and councils of arrondissements.

(3) Delegates of municipal councils.

The voting takes place in the chief town of the department under the president of the civil court as presiding officer. Senators are elected for nine years. One-third of this number is changed every three years.

The Senate, together with the Chamber of Deputies, has the initiative of laws. Financial laws are always first proposed in the Chamber of Deputies.

The Senate can constitute a supreme court to judge either the President or the ministers, or to condemn any attack against the security of the State.

By advice of the Senate the President can adjourn the Chamber of Deputies.

2. *The Chamber of Deputies.*—Deputies are elected by universal suffrage and individual ballot.

To be a deputy one must be a French citizen, 25 years of age and enjoying civil and political rights. Deputies are elected for four years. Each arrondissement elects at least one deputy. The actual number is 580.

From a legislative point of view, the Chamber of Deputies has the same rights as the Senate. It has even a priority with financial laws.

The Chambers meet every year on the second Tuesday in January. They must be in session at least five months every year.

Reflection: Deputies and senators are officers of the citizens. It is their duty to work in unison for the nation's prosperity.

III.—The Executive Power.

The executive power is vested in the President and in the ministers.

The President of the Republic is the head of the executive power—the first magistrate of France.

The President is elected by the absolute majority of votes by the Senate and Chamber of Deputies united, at Versailles, in national assembly. He is nominated for seven years, and can be reelected.

The President can be impeached for high treason only. The Chamber of Deputies alone has the right to accuse, and the Senate the right to judge him.

Reflection: M. Felix Faure has been President since January 17, 1895.

IV.—Duties of the President.

The President convenes the Chambers and closes their sessions. He communicates with them by message.

The President promulgates the laws voted by the Chambers, and assures their execution. He has the right to make peace. Amnesties can not be granted but by a law. He controls the armed force, but can not declare war without the previous consent of both Chambers. He appoints all civil and military officers, and presides at all national solemnities. He represents France, and negotiates treaties with foreign powers, but under condition of submitting them to the consideration of the Chambers. Finally, he receives ambassadors.

Reflections: The President personifies France; to be wanting in respect to him would be an insult to France itself.

I.—The Executive Power (continuation)—Ministers.

The ministers are the heads of the great public departments of administration. They are chosen by the Presidents, ordinarily from among the members of both Chambers. They have a right to the floor of the Chambers, and should receive attention when they request a hearing. They are jointly and severally responsible to the Chambers for the general policy of the Government, and individually for their personal acts.

There are eleven ministers.

MINISTER OF THE INTERIOR.

The special duties of the minister of the interior are to superintend the interior administration of France, the police, elections, public assistance, communal administration, etc. Under him are the prefects, subprefects, mayors, etc.

MINISTER OF FOREIGN AFFAIRS.

The minister of foreign affairs has charge of the political and commercial relations of France with foreign nations. Under him are ambassadors, ministers plenipotentiary, chargé d'affaires, consuls, etc.

MINISTER OF FINANCE.

The minister of finance superintends the collection of taxes, the total amount of which constitutes what is called the treasury, and regularly pays the expenses voted by the Chambers. He prepares and presents the state budget. (Refer to the lesson on financial administration.)

MINISTER OF WAR.

The minister of war is the commander-in-chief of the army. Recruitment and military instruction of the different soldiers are committed to him. He directs all that relates to the defense of our country, fortifications, distribution of troops, etc.

MINISTER OF THE MARINE.

The minister of the marine is at the head of the navy. He superintends the recruitment of the marine, the maintenance of arsenals, the construction of war vessels, the defense of coasts, ports, harbors, etc.

MINISTER OF JUSTICE.

The minister of justice, also called "keeper of the seals," is the head of judiciary power. All judicial officers are under his authority.

MINISTER OF PUBLIC INSTRUCTION AND OF THE FINE ARTS.

The minister of public instruction is at the head of all State educational institutions. All the institutions and functionaries of this minister are comprehended in the term "university," and he is also called "head master of the university."

The duties of the minister of public instruction pertain to what relates to the fine arts, museums, theaters, historic monuments, etc.

MINISTER OF PUBLIC WORKS.

The minister of public works superintends the building and maintenance of works of public interest, such as roads, canals, dikes, etc. Under him are engineers, keepers of bridges and causeways, overseers of roads, etc.

MINISTER OF INDUSTRY AND COMMERCE.

It is the duty of this minister to encourage and favor commerce and industry. He negotiates commercial treaties with other nations and superintends manufactures. The central school, the conservatory of arts and trades, art and trade schools, and commercial high schools are under his direction.

The mail and telegraph services are attached to the province of this minister.

MINISTER OF AGRICULTURE.

It is the duty of this minister to encourage and protect the interests of agriculture, one of the principal sources of a country's wealth. The minister of agriculture superintends the school of agriculture in Paris, national agricultural schools, farm schools, veterinary schools, forest culture.

MINISTER OF COLONIES.

This minister directs all colonial affairs—administration, production, etc.

WORSHIP.

The minister of worship is sometimes attached to the province of the minister of public instruction and sometimes to that of the minister of justice or of the interior.

II.—JUDICIARY POWER.

Judiciary power is vested in the courts. There are two principal kinds of courts—those administering civil justice and those administering penal or criminal justice.

JUSTICE OF THE PEACE.

The justice of the peace is the first degree of judiciary power. There is a justice of the peace in the chief town of every canton.

The justice of the peace conciliates. In civil matters he judges without appeal

in cases where the value does not exceed 100 francs. He alone, in penal matters, forms a simple police court; he can impose a fine of from 1 to 15 francs and imprisonment for two to five days. The justice of the peace is a movable office.

TRIBUNAL OF THE FIRST INSTANCE.

There is a court of the first instance in the chief town of every arrondissement.

In civil matters it judges, by appeal, affairs judged by justices of the peace, and also those which are too important to be judged by that magistrate.

As a court of correction, it judges misdemeanors punishable by more than a fine of 15 francs or five days' imprisonment.

COURT OF APPEALS.

There are twenty-five courts of appeals. They judge civil and criminal cases already judged by courts of the first instance.

COURT OF ASSIZES.

There is one court of assizes in every department. They hold general sessions. In the court of assizes the judges do not decide whether the accused be guilty or not; this duty belongs to the jury composed of twelve citizens, called jurymen.

The magistrates who, together with the jury, form the court of assizes pronounce acquittal or sentence after the verdict of the jury. Decisions of the court of assizes can be appealed only to the court of cassation, and only for an error of form.

COURT OF CASSATION.

The court of cassation is the supreme court to which decisions of the courts of appeals and the courts of assizes may be appealed. It meets in Paris.

The court of cassation does not judge; it confirms or breaks decisions; that is to say, annuls those that have been rendered contrary to law or prescribed form. If a judgment is broken, the case is referred to another court of appeals, or another court of assizes, to be reinvestigated and judged anew.

III.—PUBLIC MINISTRY.

Attached to every court of the first instance is a procurator, with one or more substitutes.

A procurator-general, attorneys-general, and substitutes of the procurator-general are connected with every court of appeals and the court of cassation. The procurators and their substitutes form what is called the parquet of a court of justice.

The office filled by these magistrates is called public ministry. In the name of society the procurator traces the criminal, brings him before the court, and out of public interests demands his punishment.

The members of the parquet change places, and are called the standing magistracy. The judges do not change places, and constitute the sealed magistracy.

Besides the courts mentioned, there are special tribunals, as commercial tribunals, seaport councils, councils of war, councils of prefecture, and State councils.

Reflection: Judges have a delicate mission to fulfill. They should be independent and impartial.

THE TEACHING OF CIVICS IN ENGLAND.

In the recent development of evening schools in England special stress has been laid upon instruction in citizenship. An elaborate course[1] upon the life and duties of the citizen has been included in

[1] The course will be found in full in the Commissioner's Report for 1893–94, Vol. 1.

the regulations for evening schools. Text-books on the subject have multiplied under the impetus thus given, and it has become a prominent theme of public discussion. One of the most valuable contributions to the literature of the subject is a pamphlet from the pen of Prof. Patrick Geddes, of Edinburgh, who not only attempts to awaken the civic sense in his countrymen, but sets them the example of earnest practical efforts for the development of municipal life. In a paper presented recently before the "Cooperative Wholesale Societies,"[1] Professor Geddes discusses the place of history and geography in education for economics and citizenship. The paper is extremely interesting and suggestive. The following extracts are pertinent to the subject.

He first discusses the relations of geography and history to education for economics and citizenship, saying:

To too many people, I fear, to speak of the study of geography is to recall those weary lists of towns and counties, those wretched enumerations of rivers and mountains, straits and gulfs, which they learned, or failed to learn, by rote at school, while similarly history may but stand for an even more dreary catalogue of names and dates. Even if we were somewhat better taught, we have done with school subjects and have no time to pore over those huge atlases of geography or read those innumerable volumes of history in our reference library. Economics is what now interests us; that deals with actual problems of capital and labor, of cooperation or socialism. We can not any longer, with the classical economists, shut off moral considerations as irrelevant, since it has now become more or less evident that the continued progress, perhaps even the continued existence, of our great modern industrial communities requires also some education in citizenship. But this education, when it gets beyond mere vague aspiration and exhortation, seems restricted to the generalities of conduct common to all civilized communities. It is not yet related to economics as a science; for what after all can it really tell or advise to laborers and capitalists? Still less has it any definite relation to history and geography. Hence, while there is no doubt that an increasing proportion of minds desire and even profit by the often excellent lay preaching of the civic moralist, there is no small danger of his failing in direct result, much as ordinary preaching tends to do, and for the same reason—the insufficiently clear relation of its general ideals to the particular details of daily life and duty; and hence, excellent as may be Mr. Acland's addition of a course upon the "Life and duties of the citizen" to the new educational code for evening schools, it is still seriously to be doubted whether the extra schoolbook which he is thus adding to the multifarious confusion of that traveling library which our children take daily upon their shoulders is as yet adapted to mean much more to them than did the edifying compilation of older mold to which too many of us still look back as of such memorable wearisomeness. * * *

Though thus so far from sharing the current optimism as to the new movement of civic education, I am not proposing to go back to the old state of things, but to go forward toward a better one. I do not propose to have any finished solution to the educational difficulty, even if there were ever very much demand for remedies to the body politic before it feels the disease, much less when it has not even recognized the possibility of one. * * * Even if we can not reform the world from our existing school machinery, nor even reform the school from our ideals of a better world, we may help each forward a step here and a step there.

[1] Reprinted in pamphlet form from the society's annual.

In another chapter of the pamphlet Professor Geddes discusses the question, What may be done by individuals in home life and how may they come in touch with the world of higher education. He says:

The children are coming home from school to prepare their lessons—so much history, so much geography, and now also so much "citizenship." We men have our newspapers, our cooperative annual, and what not, our economic and political interests generally. Our wives and sisters have their domestic cares, their keen personal interests, their wide and warm, if vague, sympathies. Can we not in some way bring all these divergent interests together? Each at present, must it not be frankly admitted, rather bores the other, however strong be the bond of natural affection.

The men can not but weary of the women's talk and the women of the men's reading, while the children understand neither; and if either help the children with their lessons it is surely more as a duty than a pleasure and with a keen sense of thankfulness that one has not one's self to practice this rule or pass that examination. No real connection of these different mental interests ever occurs to most people as possible, and so each of us goes on in his old way and returns to his own world of ideas and culture—for the child, the school; for the woman, perhaps the church; for the man, his club, committee, or reading room; and the home thus gradually dissolves until too often we reach the all but complete disintegration too common in the Parisian household. Here, however, at length comes in the essential point and thesis of the present paper—that all these apparently distinct studies and interests are but the scattered elements of what should be a well-knit unity, toward weaving which we may find at once a useful start and stimulus in this new course of education in citizenship. * * *

No intelligent man but may at any rate now and then help his son over his difficulties with the text-book of citizenship and put more meaning into those general accounts of Parliament and ministry, of municipal cooperation or poor rate, of army or civil service, which the new subject requires, from his own experience or reading. And having thus made a beginning as a teacher, he will soon begin to reap the reward of every true one—that of constantly finding out where his own knowledge is deficient and of every now and then awakening to see even the most familiar fact from some fresh point of view.

The author then advises the use of appropriate storybooks, saying:

I think it by no means irrelevant to this discussion of geography and history for economics and citizenship, but possibly reassuring to some parent, suggestive to some teacher, at any rate encouraging to some schoolboy here and there, to testify (as I dare say many others might also do), first, that I now see I got no such real glimpse either to the concrete realities of geography or of the elementary realities of economics at school, nor even until I had wandered through a dozen universities, as I got from these simple coral island and fur-trading stories of Ballantyne's; secondly, that such public and civic feelings as I may now have to go upon were first awakened into life and action not by the abstract moralities nor the historical and statistical facts, of which I got my full share, but by Ballantyne's Lifeboat and a boyish attempt to help the "National Lifeboat Association," for which that book so strongly pleads; thirdly, after seven or eight years' responsibilities in the organization of historical studies and a good deal of personal work, particularly at the dry and unimaginative task of compiling all known dates, reigns, battles, and all the rest of it into an historical atlas, or rather chart, I have heard of no other introductory guide to history who can replace Sir Walter.

Since public libraries were opened we have constantly had lamentations over the decline of serious reading, evidenced by the high proportion of "fiction" to "substantial works," of mere "novel reading" to "solid reading." The obvious

elements of truth in this criticism I need not insult anyone by pointing out, but there is more need to suggest that he may as profitably think out the fully as large element of error in it, the still larger elements of error in the remedies commonly proposed. Though personally a reader of books whose solidity reaches what most of even these most serious people consider the most utter and intolerable dryness and a writer whose most imaginative flights have been confined within the limits of the Encyclopædia Britannica and its congeners, I am more and more convinced that we serious people have been wrong and that the growing predominance of the literature of imagination and feeling over the literature of pure intellect is perhaps the most hopeful sign of the times. But most of this fiction is rubbish, say you? No, not most of what people read most as distinguished from what they only look at, sample, dip into, and skim. The reviewer helps the educated classes, and, like the tea taster, does the sampling for us; but the general reader is only learning to use the often excellent reviewing of the leading newspapers, and it will not be until the halfpenny evening newspapers take up the same work and do it as regularly and as well, and until some other of the bits of social organization half suggested above have come into full activity, that we can reasonably expect much improvement from the great body of younger and simpler readers.

Weed out, then, by all means, the inferior literature of imagination and feeling, but there will still remain much of what the Puritan within us most dislikes—that literature of inferior or debased imagination and inferior or debased feeling which yet fascinates the reader by its literary power. Here, of course, a finer criticism may come in, but still hardly a reader will be gained for the "solid" books. What, then, is the remedy? It is to make these solid, dry bones live; and whoever has the open secret of doing this will not always lack readers. The natural sciences are one to the learner. The astronomers and geologists have largely succeeded—witness Proctor, Lockyer, or Ball, Hugh Miller, Lyell, or the brothers Geikie; and at times, too, the naturalists, from Buffon and Huxley, or more lately Arthur Thomson and Professor Drummond. In this way, for instance, the very word "evolution" is coming to have, with its vastly deepening intellectual meaning, a corresponding infinitude of imagining possibilities, and with these of moods of feeling, from blackest pessimism to inextinguishable hope and brightening joy, for though still a few years ago a byword to many and at best a zoological and botanical theory to the few, it is now seen and felt to be the name of the great "Drama of the Universe."

Of this drama we see each man is, as in a dream, both actor and spectator. He is gradually awakening to the spectacle of the natural world around him, and speaks of his scanty but increasing store of ideas as the "Progress of natural science." He utilizes and modifies the world to his changing needs or impulses, and calls the result "Progress of industry." But it is his fellows that most interest him, and nature seems but the background—the scenery and stage—for the great spectacle of the human world. To-day, to-morrow, yesterday, these are what primarily interest us, and hence we rightly buy our daily newspapers as the bill and abstract of the play, or rather the day's act. But to understand the present day we need to survey and condense the records of many past ones; that is "History." Again, we can understand neither past nor present acts without knowing something of the scenes which condition them, and this is "Geography." But we would not choose to listen to loose, haphazard fragments of the play, and these without seeing or at any rate thinking of the scenes where they were laid. Still less would we try to learn by rote a mere catalogue of pieces of scene without caring or even knowing what part of the play they belong to. Yet this has been for long enough the "history" and the "geography" of the schools, and, though both are improving and better teachers are scattered everywhere, it is not too much to say that their needed reorganization and reunion is scarcely more than begun.

CHAPTER VIII.

EDUCATION IN GREECE.

By DANIEL QUINN, Ph. D.

INTRODUCTION.

I first became interested in the Greeks of to-day because I regarded them as descended from those old Hellenes whose culture and civilization, as classic and as Christian, are the foundation that lies beneath all modern progress.

But without losing my intense love for classic Hellenism, I soon began to admire the modern Greeks not so much on account of their historic ancestors as on account of their own sterling virtues and high natural intelligence.

I feel that I now admire the ancient Greeks even more than I did in the enthusiastic days of my youth; but I admire them as well for having produced the modern Greek, with his noble and determined aspirations, as for having civilized all the rest of Europe.

Of all the phases of contemporary Greek life, their system of education is in some respects least attractive to us, because it is the most modified by foreign influence. Indeed, even a close observer might think that the system is entirely a foreign one. But it is wrong to judge entirely by the appearance of the body what the soul is. The outward form of modern Greek education is German and French in character, but the soul is Hellenic. In the following pages, unfortunately, I portray the outward form rather than the soul; and I give not so much a full picture as the merest sketch—a sketch in some parts clearly delineated, in other parts most imperfectly, but a sketch which I hope to finish year by year into a more presentable picture.

WASHINGTON, D. C., *September 21, 1897.*

VARIOUS AND GRADUAL MODIFICATIONS THAT GREEK EDUCATION AND CULTURE UNDERWENT FROM THE FIFTH CENTURY BEFORE CHRIST DOWN TO THE CHRISTIANIZATION OF THE GREEKS.

When we think of Greece, we usually picture the Greece of classic days—Greece that we became acquainted with when we were boys at school; Greece which in the age of Perikles created itself into a state of society which ever since has been regarded as a model for imitation and for study.

Greece of to-day is far different from the ideal land of our schoolboy dreams, and yet Greece of to-day is so essentially one with Greece of the past that it is impossible to understand modern Greece without knowing classic Greece and the unbroken history of the Greek people from those classic times down to the present century. Here, however, is not the proper place to treat in general of the history of Greece. I merely say that in writing about the condition of education among the modern Greeks it must be taken for granted that the history of the people is quite well

known. I wish also to note the fact that not a few historians of repute recognize the uninterrupted continuity of Greek history through a period of almost thirty centuries, and give an unbroken account of the origin and growth, glories and disgraces, triumphs and falls, of this nation from its first obscure days down to our own age—such historians as Paparrhigopoulos (Κ. Παπαρρηγοπούλου Ἱστορία τοῦ Ἑλληνικοῦ Ἔθνους ἀπὸ τῶν ἀρχαιοτάτων χρόνων μέχρι τῶν καθ' ἡμᾶς. ἐν Ἀθήναις, 1886–87, 5 vols.), Lampros (Ἱστορία τῆς Ἑλλάδος ἀπὸ τῶν ἀρχαιοτάτων χρόνων μέχρι τῆς Βασιλείας τοῦ Οθωνος ὑπὸ Σπυρίδωνος Π. Λάμπρου. ἐν Ἀθήναις, 1886–1892; completed down to the reign of the Empress Eirene), Timayenis (History of Greece from the Earliest Times down to the Present, by T. T. Timayenis, 1883), Wlad. de Brunet de Presle et Alex. Blanchet (La Grèce depuis la conquête romaine jusqu'à nos jours, Paris, 1860), and George Finlay (A History of Greece from its Conquest by the Romans to the Present Time—B. C. 146 to H. D. 1864. Oxford, 1877).

Just as the thorough historian must trace the entire Hellenic stream in order to understand that portion of it which he sees to-day flowing by, so is it also necessary in writing of education in Greece of to-day to look back over the Greek education of the past. However, despite the importance of the history of education in ancient Greece, I shall treat it very briefly. It is already well known. The nearer I approach to our own times the more diffuse do I intend to become. But before beginning it will be well to give a brief survey of the history of the Greeks.

The history of ancient Greece is the history of a number of independent States. In classic times, and even later, Greece could no more be regarded as a unit well compacted than can Europe of to-day be regarded as such. Sparta, for instance, and Athens, were just as independent of each other, and just as jealous, as are France and Germany. And just as France and Germany could unite only against some common enemy that threatened to destroy both, so could such ancient States as Athens, Sparta, Argos, Thebes, unite only when all were equally threatened with destruction by some external foe, like the Persians. But just as Europe and America of to-day may be regarded as a unit distinct and different in civilization from the civilization of Asia or the barbarous or semibarbarous civilizations of other countries, so could Greece in those classic days be regarded as a unit against the rest of the world. As long as Greece remained independent, she thus continued to be a number of small States, bound together, not as parts of an organized whole, but by the brotherhood of common origin and, occasionally, of common interests.

After Greece lost her independence this lack of unity is not so apparent. This is because Greece as a nation was no longer a factor in the political world, at least until she reappeared in Byzantine form. During her long subjection to foreign power her influence came from her citizens as individuals. As a nation she was powerless. It is only in our present century that Greece, after a resolute and successful struggle for freedom, finally manifested her unity in an outward and enduring manner. For since the London conference of 1830 the Greeks of the mainland and of a number of the islands constitute an independent and solid kingdom.

Since education affects the entire course and all the actions of the individual's life, both as private man and as citizen, and since, again, all the other great institutions of a nation affect the conditions and quality of the education of the individual, it would be necessary, in order to thoroughly comprehend a system of education in vogue among a people to know scientifically and in detail the entire contemporary life and doings of that people. But the history of the Greeks from their submission to the Romans in 146 B. C. down to the establishment of the Eastern or Byzantine Empire, with its center at Constantinopol, in 323, and thence through the middle ages down to the fall of that city in 1453, is not yet more than crudely known to us. Accordingly we can but imperfectly understand its systems of education.

For the sake of orientation, I here recall certain epoch-making events in the long life of the Greeks.

Greece may be said to have been in her highest prosperity and civilization at about the time of the breaking out of the Peloponnesian war in 431 B. C. The disastrous

effects of this war, which lasted almost thirty years, started Athens, then the great center of art and literature and all phases of Greek civilization, on her downward course.

In 338 B. C. Greece lost her independence on the battlefield of Chaeroneia and became a portion of the Kingdom of Makedonia. The Makedonians claimed to be Greeks. If they really were not Greeks, they at least became such in culture and civilization soon after their closer contact with the conquered.

In 323 B. C. Alexander, King of Makedonia and son of the conqueror Philip, died in Babylon, after having brought under his control all of the world that lies between the Euphrates and the Adriatic, the Danube and the deserts of Arabia and Africa. He subjected these various peoples to Greek civilization and Makedonian rule. After his death his vast empire was divided among his generals. Thus a number of smaller kingdoms arose, such as that of the Ptolemies in Egypt, or the Selevkids in Syria, or the Attalids in Pergamon. Each one of these smaller kingdoms became an independent center of Greek life.

Gradually, however, all of these Greek kingdoms fell under the great new power of the West, Rome. But Rome, like Makedonia, on acquiring dominion over the countries of the Greeks, herself became Greek in culture. (Cf. De Literarum Artiumque Liberalium sive Ingenuarum apud Romanos Conditione, by Dr. F. Krause. Hohenstein, 1849.) In 146 B. C. the Romans, after destroying Korinth, reduced all of Greece proper to the condition of a Roman province, as part of Makedonia. And from that time on Rome rapidly spread her rule over all Greek lands.

When, in 323 after Christ, Constantine, feeling that the capital of the great Roman Empire should be situated farther east, selected Byzantion, he and his followers succeeded in keeping this new eastern empire for a time Roman rather than Greek in official language, in court practices, and other externals. Finally, however, the soul prevailed over the body, and Byzantion and its provinces came out in their true nature, an independent kingdom, with Greek language and Greek traditions. The court alone and what directly depended on it remained tinged with a certain Roman coloring. However, the people accepted and willingly kept the name of "Romans."

While Greece as a nation was buried in the Roman Empire Christianity came into existence in Judea, a small nation also subject at that time to Greek culture and to Roman arms. After this new religion had taken first roots in its native country Greeks and Greek-spirited Jews undertook the spreading of it throughout the vast Roman Empire. On this account Christianity, though first taught among a Semitic people, yet is bound up with Hellenism. The new religion accepted the wisdom of the Greeks. The new doctrines were explained in the well-prepared language of Platon and Aristotel. The Christian teachings spread with wonderful rapidity. Its teachers were Hellenists, and the vehicle through which it was presented as a systematic body of doctrine was the Greek language and Greek metaphysics. The great teachers and formulators of the dogmas of Christianity were mostly Greeks.

The new empire of the east, Roman in its name, Greek in its feelings, was Christian in its religion. From the prominent part performed by Greeks in the spreading of religion, the Eastern Empire came in a certain way to regard itself as the great protector and director of Christianity. Thus the earlier councils of the Church were held in that Empire; and thus all the disputes relating to what the true Christian doctrine was in detail arose there. Most of the great heretics as well as most of the great orthodox teachers were of the Eastern Church.

Being a Christian Kingdom, many of the practices that bound the people to their pagan past died out. The gods were forgotten, or rather replaced by saints. The great feasts of pagan worship gave way to the grand pomps of the Christian ritual. In 393 the Olympian games were celebrated for the last time. In 529 the schools at Athens were closed by Justinian. Athens had long since ceased to be the great center of Hellenism. Constantinopol was now the center. The emperors ruled there in a magnificence beyond our knowledge. The gorgeousness of the church almost rivaled that of the state. The patriarch was in one sense as mighty as the Emperor.

But the great Empire had many enemies. Not only were there continually internal dissensions arising from differences in religious beliefs, rivalries of princes and generals, of priests and monks, of various classes of the people at large, but it had many enemies from without. Many a horde of sturdy barbarians looked with hungry eye toward Constantinopol, for Constantinopol was the greatest center of wealth and luxury in the world.

Various tribes of northern wanderers began to come down into the fair provinces of Greece. In the year 262 after Christ the Goths came, burning and plundering as far as to the gates of Athens. These are the Goths that had already defeated the Roman legions, and who later destroyed the Western Empire. But they were repulsed by the Athenians and forced to retreat.

In 395 the Goths stormed down into Greece again. This time their leader was Alarich. They destroyed Elevsis and Athens and other places in north Greece, and, entering the Peloponnesos, they left it a burning waste. In 470 the Vandals were ravaging Greece. In 540 the Slavs came down into the provinces of Greece, and in 588 they came again with the Avars. In 1019 the Bulgarians were defeated at Thermopylæ and at Athens by the Emperor Basileios I. At about this same time the Albanians make their appearance in Greece. In 1040 the Warangs, a Norwegian tribe, under Harald Haardraade, plundered Athens. In 1084 the Normans came down as far as Larissa.

What the ethnological effect of these various invasions was we have not now time to consider in a thorough manner. An opinion set afloat by Fallmerayer in his history of the Peloponnesos (Geschichte der Halbinsel Morea, Stuttgart und Tübingen, 1830–1836) asserted that these various invaders, after entering Greece, ceased to be wanderers and roamers, and settled down in the villages whose Greek inhabitants they had killed, and that therefore the modern inhabitants of Greece are a much mixed race, having almost all kinds of blood in their veins except Hellenic. This novel and fantastic opinion was immediately attacked by Hellenes and Philhellenes on patriotic as well as historic grounds. No one now defends it. These hordes of plunderers found nothing in Greece to entice them to remain there. However, various tribes of Slavs and Albanians did make small settlements here and there in Greece in those days.

Another element that came into Greece was the Wallachian. The Wallachs came peaceably as shepherds and settled in the mountains. In the fifteenth century bands of Wallachians were to be found as far south as the Taygetos Mountains. (See Chalkokondyles, ed. Migne, p. 44.) But the Wallachs are not and never have been numerous in Greece. Of all the foreigners that settled in Greece during the middle ages the Albanians were the most numerous and have left the greatest number of descendants. And yet in all Greece to-day these Albanians do not number more than 100,000. (See La Grèce au point de vue naturel, ethnologique, anthropologique, démographique et médical, par le Dr. Clon Stephanos, Paris, 1884, p. 430.)

These invasions were indeed calamitous to Greece and the Eastern Empire. But a greater misfortune than all of these invasions were the armies of the west, which, starting out as crusaders or under the pretext of being such, often found the rich cities of the Eastern Empire temptations toward plunder too strong to be resisted. The fourth crusade was nothing other than a plundering expedition of brigands, who deliberately went to divide up the Byzantine Empire according to a prearranged plan. In 1204 they got into Constantinopol by treacherous promises and took possession of the city. They held it for fifty-seven years, establishing a Latin kingdom there. They took many of the provinces also, making them princedoms for western knights.

At this time all of Greece proper fell into the hands of the Frankish princes. Greece remained under western control, chiefly French, Genoese, and Venetian, from that time until the Turks gradually got possession of the country after the fall of Constantinopol.

At the end of the fifteenth century nearly all of Greece proper, except certain

mountain holds whose inhabitants were never really subdued, and nearly all of the islands except Krete and Tenos and a few others, were subject to the Turks. So the country remained until 1821, when the revolution broke out, which gloriously ended in bringing back their old independence to a portion of the Greeks. And this portion constitutes the present Kingdom of Hellas.

Απ' τὰ κόκκαλα βγαλμένη
Τῶν Ἑλλήνων τὰ ἱερά,
Καὶ σὰν πρῶτ' ἀνδρειωμένη
Χαῖρ' ὦ χαῖρ' Ἐλευθεριά.

THE PRESENT KINGDOM OF GREECE.

Greece of to-day is a small Kingdom, with its seat of government at Athens, the center of old classic Hellenism. The Kingdom includes all of the peninsula as far north as the Ambracian Gulf and nearly to the Melouna Pass, near Olympos.

In 1830 the London conference recognized the existence of Greece as a free nation. In 1864 England ceded the Ionian Islands, which lie along the west shore of the Peloponnesos and Akarnania to the Kingdom of Greece. In 1880, at the behest of Europe, in the treaty of Berlin, Turkey ceded Thessaly and a small portion of southern Epeiros. The area of the Kingdom is about 24,800 square miles. The present population, according to the census of 1897, is about 2,433,806.

But the yet unredeemed Greeks living outside of this territory regard it as merely a piece of ill fate that they also are not a part of the Kingdom. They look to Athens for light and guidance. In education, as in other respects, they follow the lead of Athens. Accordingly it will be necessary farther on to refer to the condition of education among them.

THE BEGINNINGS OF EDUCATION IN GREECE.

No date marks the first discovery of the need of education. No page of history can precisely indicate to us the time at which the inhabitants of Greece began to be dissatisfied with simply letting their offspring grow up with only such care and crude training as savages give to their children.

That the inhabitants of Greece were a civilized people long before they knew how to read and write seems proven by archæological research. (See the Mycenæan Age, by Dr. Chrestos Tsountas and J. Irving Manatt., Boston, 1897.) The Greeks of the Mykenæan period trained their children, but not in letters. Young boys learned how to do the work that awaited them as men. Every boy learned how to fight and to hunt, to rule or to obey. Many learned some one or more of the different arts, such as architecture, pottery, decorative art, and the making of various instruments and arms, especially from bronze.

But ages before the coming of such education as is inseparably connected with the learning and employing of letters this old civilization had passed away. Indeed, we can not expect to find written thoughts, and therefore literary education, earlier than the beginning of the seventh century B. C. The origin and gradual adoption of the habit of writing in Greece is now quite familiar to us, thanks to the studies of Kirchhoff (Studien zur Geschichte des griechischen Alphabets, vierte Auflage, 1887), Larfeld (Griechische Epigraphik), and others. In the sixth century B. C. the Phœnician alphabet was already common property throughout all Greek lands. True it is that the only documents that have come down to us in writing from that time are inscriptions on stone and bronze, and even they are rare. But the existence of these inscriptions proves that then it was not rare to know how to read and to write.

Since ability to read and write presupposes a certain amount of education, it follows that we can assert the existence of education throughout all Greek countries in the sixth century. But education was developed differently by the different tribes. Education in letters found favor especially with the Ionians. The Ionian

type of education prevailed at Athens. And since it is Athenian education that most of all influenced later Greek education, just as Athenian literature became the model of later Greek literature, we in this chapter on ancient Greek education shall confine ourselves almost exclusively to education at Athens. And since Athenian education was at its height in the fifth century before Christ, most of our descriptions in detail will refer to Athenian education as it was in this fifth century.

EDUCATION IN THE FIFTH CENTURY B. C., ESPECIALLY AT ATHENS.[1]

The most interesting period in the history of Greek education is probably that at which the literature and arts and political institutions of Athens were at their highest. This period may be conventionally regarded as beginning about 480 B. C. and closing about 325 B. C. It is during this period that "higher education" was developed into a system by the philosophers and sophists; but since the work and influence of these men are well known we shall say very little about them, confining ourselves chiefly to observations on such education as boys received before entering on their eighteenth year, when they were enrolled as "ephebi."

Boys began to learn to read when 6 or 7 years old (Platon, Laws, VII, 794 c). Aristotel, in his Politika, says that up to the seventh year the boy should be under the care of his nurse. The Athenians were very careful to provide proper persons to take care of children. Quintilian tells us (I, 1, 4) that the celebrated stoic philosopher wrote a treatise on this subject, explaining why persons to whose charge children were intrusted should be cultured and educated and in the habit of speaking the Attic dialect correctly and without foreign pronunciation or foreign idioms, so that from the very beginning the child might learn such language as he later would use and hear in the the ekklesia and the agora.

From Philostratos we learn that these nurses used to delight in teaching little children by telling them fables from Æsopos about the mouse and the weasel, and the fox and the wolf, etc.; also that they used to tell them of the triumphs of their father or their older brothers in the debates in the public assembly, or in war, or in the athletic games (Philostrat. vit. Apoll. Tyan., V, 14). They also used to tell them the beautiful myths that served instead of past history to the Greeks. So that even in those days "nursery tales" (*τιτθῶν μῦθοι*) were as much of an institution as they used to be with us (Hipp. maj., p. 286).

When in his sixth or seventh year the boy went to school, his first teacher was the so-called *γραμματιστής* or *γραμματοδιδάσκαλος*, or simply *διδάσκαλος*. This teacher usually kept his school within doors, often, however, in the open portico of some

public edifice, or at times in the open air under a tree or in some quiet corner. In the Anthology (XI, p. 437) is an epigram which reads—

Αἰάζω Διότιμον ὃς ἐν πέτραισι κάθηται
γαργαρέων παισὶν βῆτα καὶ ἄλφα λέγων;

that is, "I pity Diotimos, who sits among the rocks and drills the boys in the alphabet."

Although the State may have desired that all boys attend school, yet it did not supply buildings for that purpose, and as a rule did not pay the teachers' salaries. Only after the times of Alexander do we find provision in Athens for supporting teachers. All schools were under private management. They naturally varied much in efficiency of teachers, in equipment, and in the social standing of the families that sent their children to the schools. One can easily imagine an Athenian school presided over by one teacher whose only book was a collection of excerpts from Homer, and his only other material equipment one stool, one waxen tablet, and one harp. But there were other schools with a number of teachers and with good equipment. Such a school does Demosthenes describe (On the Crown, 258), referring to the youthful days of his antagonist, Æschines, whose father was a school-teacher.

In some of these schools the number of pupils was very large. Herodotos (VI, 27), for instance, mentions a school of 120 boys in the town of Chios in 494 B. C. The roof of the school fell in and all the boys were killed except one. The school of Stratonikos, the music teacher, will serve as an example of a small school. The room in which he held school was adorned by the statues of the nine muses and Apollon. He had but two pupils, but when asked, "How many have you in your school?" replied, "Twelve, for the gods are with me" (*δώδεκα συν θεοῖς*).

On an ancient vase, the so-called Duris vase, we find a school scene painted. Some of the pupils are engaged in reading, others are listening, others writing. The teachers are seated on large chairs with backs to them; the pupils are standing, or seated on low stools. Musical instruments and other objects are hanging on the wall.

The young boy did not go to school unaccompanied. As soon as he was old enough to leave the protecting care of mother and nurse he was put under charge of a pedagogue. It was the duty of the pedagogue to accompany the child wherever he went. On the Duris vase we see a pedagogue in the school. He watched over the boy at all times, took care that he developed proper habits, civil manners, etc. He accompanied him to school, to his music teacher, to the teacher of calisthenics. He carried his books and waxen tablets and harp. He selected the boy's companions, and did not allow him to speak with strangers or with others that might in any way harm him. The pedagogue was generally a kind old man—a tried servant. In art he is represented as bald with wrinkled forehead, wearing a long chiton belted at the waist, and over this a loose flowing mantle. He generally carried a long staff with a crooked top.

The young boy went to school at sunrise and often spent the entire day there, with the exception of a short pause at midday for lunch. (Thuk., VII, 29; Æsch. Timarch., 12.)

It is scarcely necessary to state that often rich parents kept a teacher in the house for their children. In Diogenes Laertios (IV, 74) we read of how Diogenes of Sinope served as teacher in the house of Xeniades. He had been kidnapped by pirates, who sold him as a slave to Xeniades, and Xeniades kept him to teach his boys.

The course of studies consisted of three branches—letters, music, and gymnastics These constituted the *εγκύκλιος παιδεία*, or circle of studies. Often the same teacher taught both letters and music in his school. Sometimes, however, the pupil took his letters in one school and his music in another. The gymnastic exercises were always taught in places fitted out especially for that purpose. It seems that up to about his twelfth year the young scholar spent most of his study time at music and letters. For the Greeks the relationship between music and literature was very close. Of

the two, music was naturally the older, and their cultivated literature grew out of their cultivated music. We are not surprised that they kept the two so closely united in their school curricula.

As soon as the pupil learned to read he began to study the poets. He was obliged to copy special passages on his waxen tablet. Little use was made of what we call text-books. The pupil studied no lessons at home. Much of his literature he learned word for word by memory. The teacher helped him in this by reading with clear, firm pronunciation one or two sentences and then having the pupil repeat them. It is not surprising then to read of old Athenians that knew many poems from beginning to end by memory. Most educated Athenians could quote readily and extensively from Homer and the other poets. Nikeratos (see Xen. Sympos., III, 5) could repeat both Iliad and Odyssey from beginning to end. The reading books most used by the pupils were made up of selections from various poets put together into one volume. Such a collection was *αἱ ὑποθῆκαι τοῦ Χείρωνος*, said to have been collected by the centaur and used in the education of Achilles. (Bernhardy, Griechische Literatur, II, A, 535 ff.).

These readers included excerpts from Phokyllides, Solon, Mimnermos, Theognis, and other lyric and gnomic poets. Probably also the dramatic poets were read, but the poets most preferred were Homer and Hesiod. Well known is the story about Alkibiades and the teacher. Alkibiades told the teacher that he wished to learn to read Homer. The teacher said that he had no copy of Homer. Thereupon Alkibiades rapped the teacher with his cane and went off to another school. (Plut. Alkibiad. 7.)

They studied the prose writers as well as the poets. However, it seems that they read the poets during their younger school years and the prose writers later. During their ephebeia—that is, from their eighteenth to their twentieth year—they may have read prose authors more extensively. At least an inscription has been found, belonging indeed to a time later than the period we are now considering (see Corpus Inscriptionum Atticarum, II, 992), but yet perhaps indicating a practice as early as our period, which contains a list of books which ephebi should read. The list contains the names of both poets and prose writers. Unfortunately the inscription is preserved only in a fragmentary condition.

It is not difficult to understand why the Greeks kept music and literature so closely allied. To the Greek the term music included not only what we understand by vocal and instrumental music, but also a knowledge of the laws of meter, of rhythm, of pronunciation, of enunciation. The musical instruments whose use was taught in the schools were the lyre and the flute. The flute, however, was not a favorite instrument. With the Greeks instrumental music was entirely subservient to the thought expressed in language, and its principal use was to accompany the chanted words. The flute, therefore, was regarded as an instrument that degraded the player, because it prevented him from using his voice. Moreover, they thought that it added no grace of pose and that it distorted the face. A myth used to be told about Athene, that she found a flute and began to play on it, but happening to see a reflection of herself in her polished shield she was disgusted at how the blowing on the flute made her mouth crooked and caused her eyes to protrude and her cheeks to swell out. So she threw it away as far as she could. A satyr found it, and made merry times with it. (Aristotel Politica, 8, 617.) Alkibiades was advised by his teacher not to talk so much if he wished to learn the flute. He replied: "In that case I do not wish to learn it; teach it to the Bœotians, who are too stupid to talk." (Plut. Alkibiad., 2.)

Greek education did not profess to produce specialists. Accordingly, such musical training as was given in the schools was very different from what was given to those that wished to become professional musicians. In the time of Aristotel, however, this high idea was no longer upheld, and he complains that in his day most people learn music not as a means to culture, but to pleasure.

How common it was for Athenians to have a certain amount of education seems to be shown by the sausage man in Aristophanes's Knights (188 f.), where, to heighten

the boorishness of his character, he is made to say that he has no learning other than a slippery knowledge of the letters,

Αλλ' ὦγαθ' οὐδὲ μουσικὴν ἐπίσταμαι
Πλὴν γραμμάτων, καὶ ταῦτα μέντοι κακὰ κακῶς.

The Athenians worshipped not only intellectual and moral perfections, but also those of the body. They thought a sound body to be a worthy possession, and took special care to educate the bodies of their boys into strong, lithe, and sinewy ones. The younger boys received their physical training in the palestra. Their older brothers, above the age of 18, went to the gymnasia. The palestra was an inclosed space with room to throw the diskos and the javelin, to race, to wrestle. There were places where they could roll in the sand, bask in the sun, anoint themselves with oil, and bathe.

Such was the education of soul, mind, and body that the boys of the Athenians enjoyed up to their eighteenth year.

THE EPHEBI.

At 18 years of age the Athenian became an ephebos, and as such entered upon a two years' probation before being allowed to enjoy the rights of citizens. These two years of ephebia were devoted chiefly to a kind of military life, but at the same time intellectual training was not entirely neglected. However, they did not frequent any regularly established institutions for higher learning. No such institutions existed for them. The first representatives of a higher scientific culture in Greece—the philosophers, the artists, the architects, the physicians—did not found institutions that could be frequented by whosoever wished. They rather confined themselves to a personal following and taught in such a way as suited intimate and personal friendship. Even medicine was not taught in a public way, but handed down traditionally and orally from old practitioners to favored pupils. Thus it was that such professions were, at least in earlier times, usually confined to certain families, as, e. g., that of medicine to the Asklepiads.

Perhaps the first philosophical school that could be regarded as a systematic organization for higher studies was the Pythagorean. Here we find definite studies—philosophy, mathematics, moral teaching, religious teaching, music, medicine, etc. But the teachings of the Pythagoreans were not accessible to all as a general means of education. They were intended only for the members of their own society.

But in the second half of the fifth century before Christ a class of men arose who professionally offered themselves as teachers of higher studies, accepting as disciples whoever would pay them. Among these new professional teachers we find many remarkable men. But their methods and doctrines were not always blameless. Their successors, Sokrates, Platon, Aristotel, have not left us a favorable record of them. Their very name has become synonymous with deceit in matters of intellect—sophists.

But the tendency of these sophists to gather groups of scholars around them gradually developed into the founding of real schools for higher learning. Platon and his disciples met in the grove called the academy, where Platon had caused suitable buildings to be erected for the benefit of the students. This academy became in a true sense a fixed and well-established school. Likewise did the Peripatetics found a school, establishing themselves in the gardens and buildings which Theophrastos gave them. The Epicureans lived in a large house bequeathed to them by their founder. We have thus the first settlings of scholars into what we may call institutions of higher learning.

These schools increased the reputation which Athens had long been acquiring as being the center of culture in Greece. This intensity of education attracted young men from beyond the confines of Greece proper even as early as the time of Isokrates. In his day youths came from "Sikelia and Pontos and other places" to be educated in Athens. (*περὶ Ἀντιδόσεως*, 224.) It must not be forgotten, however, that they

came to Athens not as though it were the only center of education, but merely because it was the most famous center.

In these institutions rhetoric, poetry, logic, dialectics, metaphysics, pure mathematics, the natural sciences, etc., were taught. But professional schools also began to exist. The Asklepiads founded two famous schools of medicine—an empirical school at Knidos, and a philosophical school of medicine at Kos. This school of Kos produced Hippokrates, the first great scientific physician of the Greeks.

Of the natural sciences, geography was one of the first to be cultivated. On account of the practical knowledge gained by traveling for the sake of trade, as well as the information gotten by coming into contact with Phœnicians and others, geography had made respectable progress in the fourth century before Christ. Pytheas, who according to Bougainville (Memoires de l'Académie des Inscriptions, XIX, 148) flourished before Aristotel, made use of astronomical observations to fix localities. He had voyaged as far north at least as England.

Geographical maps are of ancient origin. The earliest one mentioned in Greek literature is accredited by Strabon (I, 17) to Anaximandros, of Miletos, a disciple of Thales. Thirty years after the death of Anaximandros, Aristagoras, tyrant of Miletos, came to Sparta to persuade King Kleomenes to engage in war with the enemies of Aristagoras. He brought with him a map of the countries of Asia which he wished to induce Kleomenes to invade.

SPREAD OF GREEK EDUCATION IN ALEXANDRIAN TIMES.

The armies of Alexander subjected the whole eastern world to the Græco-Mackedonian sway. The numerous smaller kingdoms that sprang into existence out of his vast conquests all claimed to be Greek, and with a certain violence of fate took to Greek culture and habits and education. Thus did the whole eastern world become Hellenistic if not Hellenic, having centers of learning and schools of literature and philosophy at Athens, Alexandreia, Pergamon, Rhodes, Byzantion, Tarsos, and many other places.

The scholars of this period were not creative, but rather reflective. They did not produce great masterpieces of poetry or art, nor did they devise new systems of philosophy. They were scholars and critics, rather than original makers. They were students and codifiers. They gathered together the wisdom of their forefathers. This they transmitted to posterity. In Alexandrian times higher education concerned itself chiefly with seven branches—philosophy, rhetoric, dialectics, mathemathics, geometry, astronomy, and music. Athens was the most famous seat of philosophy, and Alexandreia of philology.

Elementary schools during this period must have been very similar to the same schools of the preceding period. Most of them were private affairs. The grammatodidaskalos opened a school wherever he could succeed in getting a few boys together. Girls received their elementary education at home. Women, however, were not entirely debarred from the advantages of higher education. It seems that they sometimes frequented the schools. And we have instances, even, of women teaching in these schools. Of these Hypatia is a well known example.

It may be that provision was occasionally made for the educating of children of such parents as could not afford to pay the school expenses. We possess a highly interesting inscription from the island of Teos describing details relative to a school in that city in the third century before Christ. (See Bulletin de Correspondence Hellenique, p. 110 ff., and Dittenberger, Sylloge Inscr., Græc., 349.) The inscription records the fact that Polythrous, a Teian, gave to his city 34,000 drachmas to be used for the educating of boys and girls. He provides for the yearly appointment of three teachers of letters *γραμματοδιδάσκαλοι*, with salaries of 600, 550, and 500 drachmas each, for two pædotribes, one music teacher, a teacher of archery, and a teacher of the use of weapons—in all, eight instructors. The pupils were to be divided into three grades, of which the third was to consist of ephebi.

This instance of giving money for purposes of common education was not an iso-

lated case. Perhaps such gifts were not unusual. Among the inscriptions found at Delphi (Bulletin de Correspondance Hellenique, v, pp. 157 ff.) is one commemorating a gift of money from Attalos II, King of Pergamon, to the Delphians. From the interest of this money at 6¼ per cent, the community had a yearly income of 1,260 drachmas, which they expended in teachers' salaries.

THE SCHOOLS OF ATHENS.

From the middle of the second century before Christ down to the end of the first century after Christ, the schools in Athens flourished, and were frequented by many from outside of Greece proper. But in the second century after Christ they acquired new fame from the fact that, beginning with Hadrian (117–138), the schools of Athens came to be specially patronized by the Emperors of Rome. The Emperors established a number of salaried positions to be filled by teachers of philosophy and rhetoric. These positions were called *θρόνοι* or "chairs." It seems that the first to occupy such a throne and receive a salary from the Government was the philosopher Lollianos, who taught during the reign of Antoninus Pius (138–161). In the time of Marcus Aurelius (161–180) there existed four chairs of philosophy, the Platonists, Peripatetics, Stoics, and Epicureans having one each. Each professor received a salary of 10,000 drachmas. (See Buchsenschutz, Besitz und Erwerb im Griechischen Alterthume, p. 567.)

These different professors were absolutely independent of each other. The lectures were not all given in any one building set apart for that purpose. There was no governing head to bind the teachers together into one body or faculty, although we do hear of the office of *επόπτης*, or "director," filled in the time of Marcus Aurelius by Herodes Attikos. The epoptes seems to have been consulted in the appointment of the professors, an honor later allowed to the Areopagos.

The system of teaching by dialogue, which was prevalent in the earlier schools of Athens, gradually gave way to the method of teaching by lectures. These lectures were supplemented by exercises done by the students, similar to the students' work in modern seminaries.

In those days Athens possessed many celebrated teachers, such as Cassios Longinos the walking museion, Prohæresios, Proklos. This last scholar, in the fifth century after Christ, kept bright the luster of the Platonic school of Athens.

As Christianity began to take gradual possession of the city of Pallas, there came no remarkably bitter conflict between the teachers of the dying paganism and the new Christianity. Both met on the common ground of Greek wisdom. Now a Christian, now a pagan would fill the same thrones. Still in Athens, as elsewhere, a crisis had to come, and the teachers of the old succumbed to the power of the new.

How thoroughly Athens, after her political downfall, continued to be a city of letters is illustrated in a way not entirely complimentary to its inhabitants. In the year 267 A. D., when the Heruli overran much of southern Europe, they came to Athens and captured the city. A story says that, after plundering the city of whatever the northern barbarians thought worth carrying off, they collected an immense pile of books together and were about to burn them. But one of their number advised them not to do so, saying that it would be better to leave their books to the Athenians, because people who spend their time with books will never be warriors, and therefore will never be dangerous to such as the Heruli.

In these philosophic schools of Athens the tendency was not any longer to discover new truths, but rather to interpret old ones; not to create new sciences, but to study the sciences handed down from the masters. These teachers identified, classified, and labeled (so to speak) the specimens of science and truth that they had inherited from past scholars.

They were not regardless of popular fame. They took care to have a large number of hearers. They did not come into such personal contact with their students as did Sokrates and Platon and Aristotel. This tendency toward popularization came

immediately after the passing away of the great masters. Theophrastos, the successor of Aristotel, taught to an audience of from 1,000 to 2,000 disciples. Stilpnon of Megara used to count among his hearers many a ἑταίρα. And these ἑταίραι were not the least intelligent of his hearers.

A vivid and attractive picture of academic life in Athens in the fourth century has been preserved to us by St. Gregory Nazianzene. (Opera I. pp. 327, 328, ed. Morelli.) The arrival of a new student was quite an event. A sharp lookout was continually kept for newcomers. They were discovered even before landing, or immediately thereupon. The crowd of students that first got possession of the new arrival enrolled him into their special coterie, whether he wished it or not. They first entertained him at one of their favorite haunts or at the house of a previous acquaintance of his, or of a relative or fellow countryman. They initiated him in quite a rough way, making him the butt of jokes, raillery, and threats. The initiation ended by sending him to get a good regulation bath. Then they brought him to call on the professors, and make arrangements for attending lectures.

Not only new students but new professors also were obliged to submit to the discomforts of initiation. At least the historian Olympiodoros describes an odd series of events as happening on the occasion of the appointment of the teacher Leontios. (See Geographi Græci Minores, I, pp. 461-462.)

It is clear, therefore, that these later Greek students were sufficiently boisterous and troublesome. Not only at Athens did they act thus, but likely in all the schools of the Empire. The law students seem to have been especially prone to such disturbances. The Synod of Troullos in 691 had to take cognizance of them. The seventy-first canon of that synod forbade them in future from following heathenish practices, from organizing into theater parties, from celebrating the "kylistræ," and from wearing a dress different from that worn by other people.

THE SCHOOLS OF ALEXANDREIA.[1]

Under the Ptolemies the new Hellenism flourished in Alexandreia. Indeed, so important in the literary life and culture of those days was Alexandreia that it gave its name to the period, and we speak of all Greek culture of that time as Alexandreian.

In the city of Alexandreia the centers of this activity in higher education were the library and the mouseion.

The library was not merely a collection of books, but was an institute for higher philosophical and philological learning. Founded by Ptolemy Soter, it grew so rapidly that under Ptolemy Philadelphos it already contained 500,000 volumes.

As Athens was the center of philosophical teaching, and Rhodes of rhetoric, etc., so at Alexandreia the chief study was philology. Here studied and taught Aristophanes of Byzantion and Aristarchos of Samothrake, not to mention others also famous even down to the present day.

The mouseion was a school of arts and sciences. The studies chiefly pursued there were those not provided for in the library, viz, the natural sciences, experimental sciences, pure and applied mathematics, and medicine.

The school of medicine became famous throughout the world, especially for its surgery.

Not far from the mouseion was a zoological garden, in which were kept animals from all parts of the known world, as objects of study. There was also a botanical garden, in which strange plants were cared for and acclimatized. Astronomy was studied and observatories fitted up for this science. Eratosthenes discovered a

Dissertation Historique sur la Bibliothèque d'Alexandrie, par Bonamy, in the Memoires de l'Académie des Inscriptions, IX, 397 ff.

The Alexandrian Library and Museum, by Dr. Alfred Gudeman, in the Columbian Literary Monthly, December, 1894, pp. 1-12.

method of correcting the faulty chronological system then in use. Here it was that Euklid composed his Elements of Geometry, which we still use.

When Christianity took possession of Alexandreia, both library and mouseion were still flourishing; and many of the first and most learned of the Christians studied in these institutions. Christianity saw nothing fundamentally repugnant in them, and they continued to exist, with some opposition, to be true. Both library and mouseion flourished for almost a thousand years. The library seems to have come to an end only in the year 642 when Alexandreia fell under the sway of the Caliphs.

During this long period of existence these institutions often suffered materially. Numbers of books perished in the fires on the occasion of the capture of the city by Julius Cæsar. Again in the time of the Emperor Aurelian the entire quarter called the Brucheion was burned during a riot, and much school property destroyed.

The influence of Alexandreia on letters and culture has been incalculable. It is not an exaggeration to believe the words we read in Athenæos (IV, 184) that at one time Alexandreia taught the world. *Ἀλεξανδρεῖς εἰσιν οἱ παιδεύσαντες πάντας τοὺς Ἕλληνας καὶ τοὺς βαρβάρους.* (See also Apol. Tyan. epist. 31.)

THE SCHOOL OF PERGAMON.[1]

Pergamon after the division of the Empire of Alexander was chosen by Lysimachos to be the storehouse of his wealth. The city was conveniently situated, and its citadel was one of the strongest. Lysimachos appointed Philetæros of Bythenia to be custodian of the treasure and commandant of the city. But Philetæros, taking advantage of the war between Lysimachos and Selevkos, declared himself independent. The successors of Philetæros increased the territory of the city, and finally in the year 241 B. C., Attalos I, after having successfully driven the terrible invaders, the Gauls, out of his territory, assumed to himself the title of king.

The Kings of Pergamon were almost as remarkable as the Ptolemies for their patronage of learning and art. In fact, they became bitter and open rivals of the Kings of Egypt. In this respect, it is said that the name of pergamenian paper, or parchment for vellum, comes from the fact that when the Ptolemies, through jealousy of the school and scholars of Pergamon, forbade the exportation of Egyptian papyros into the Kingdom of Pergamon, the Pergamenians were then obliged to employ writing material of some other kind, and turned to vellum, whose mode of preparation they so improved, and which they used in such large quantities, as to give their name to the material forever. (See Plinius, Hist. Nat., XIII, 11, and Das Antike Buchwesen, von Theodor Birt, Berlin, 1882, pp. 46-126.)

This strong rivalry between the two schools and the determination of the two dynasties to acquire for their libraries every book known caused the making of a number of spurious works. If a certain writing of a favorite classic author was not to be found in any part of the Greek world, some clever scholar would often succeed in manufacturing a counterfeit copy and selling it to one of the libraries at a high price. (See Galenos in Hippokrat de Nat. Hom., II, 17.)

At Pergamon as at Alexandreia the chief studies were philology and philosophy. But history, mathematics, medicine etc., had teachers and scholars also.

Among the philologians the most noted was Krates of Kilikia, who became the founder of a special school of philology, the Kratetians, *οἱ Κρατήτιοι αἱρεσις*. Krates and his school were opposed by Aristarchos and others of the Alexandreian school. It is said that Krates and Aristarchos met at least once in dispute over their differences.

The library collected in Pergamon must have been very large, because Mark Antony is said to have sent 200,000 volumes as a present to Kleopatra, to replace the books burned by the soldiers of Julius Cæsar.

[1] See De Aula Attalica Literarum Artiumque fautrice commentationis Historicæ pars prior, quam * * * subjecit Casparus Fridericus Wegener. Havniæ, 1836.

HIGHER EDUCATION IN OTHER CITIES.

We must not allow ourselves to think that the few schools we have already mentioned were the only important ones for Greek culture. There were very many other centers of higher education in the immense territory that had now become more or less Hellenic. In Antioch we find, as in Alexandreia, a library and a mouseion. But the school of Antioch rose to its highest fame after it had become Christian. As far west as Marseilles a school for higher learning flourished. In Rome the number of Greek teachers was legion. When Æmilius Paulus conquered Perseus, the Makedonian King, he brought the magnificent library of the conquered monarch to Rome, regarding it as the most valuable part of the spoils. It was the first large library that Rome ever contained.

In the east schools existed everywhere—at Rhodes, at Byzantion, at Tarsos, etc. Strabo tells us that the inhabitants of Tarsos surpassed the Athenians and Alexandreians and every other people in philosophy and other general culture, and that they had schools for all kinds of intellectual training. *Τοιαύτη δὲ τοῖς ἐνθάδε ἀνθρώποις σπουδὴ πρός τε φιλοσοφίαν καὶ τὴν ἄλλην ἐγκύκλιον ἁπασαν παιδείαν γέγονεν, ὡσθ' ὑπερβέβληνται καὶ Ἀθήνας καὶ Ἀλεξάνδρειαν καὶ εἴ τινα ἄλλον τόπον δυνατὸν εἰπεῖν ἐν ᾧ σχολαὶ καὶ διατριβαὶ τῶν φιλοσόφων γεγόνασι * * * καί εἰσι σχολαὶ παρ' αὐτοῖς παντοδαπαὶ τῶν ἄλλων περὶ λόγους τέχνῶν.* (Strab. XIV, 5, p. 228, ed. Tauch.)

At Rhodes there was a famous school of oratory and rhetoric. The school existed as early as the time of Demosthenes, and perhaps was founded by his great rival, Æschines, who at least taught in Rhodes. This school became celebrated in the first century before Christ. It was much in favor with the young Romans, and Cæsar, Brutus, Cassius, and other celebrated men of Rome studied there.

CONDITION OF EDUCATION FROM THE TIME OF THE CHRISTIANIZATION OF THE GREEKS DOWN TO THE FALL OF CONSTANTINOPOL.

BYZANTINE HELLENISM.

Constantinopol having become the capital of the eastern portion of the great Roman Empire, Constantine and his successors employed all tangible means to increase its magnificence and importance. It soon became the political center of the Christian world. The Emperors recklessly plundered other parts of their vast domain in order to enrich and beautify their chosen city.

The schools that hitherto had been focuses of higher learning at Athens and Alexandreia and Beryttos, etc., still, indeed, continued to exist, but grew weaker and weaker, not being able to compete with the attractions of Constantinopol, and, moreover, not being in favor with either church or state, because of being still un-Roman and still pagan.

Accordingly these schools gradually decayed. The school of Beryttos (Beyroot), famous as a school of law, lost its buildings in the earthquake of 551 and never rose again into existence.

In the reign of Justinian the schools of Athens were abolished by imperial decree of the year 529. (Malalas, II, p. 187.) Monastery schools were, perhaps, established to supply their place. It may be said, however, that the neo-Platonic school was the only one still in active operation, and this had already lost its importance. Teachers and students were but few.

It must not be forgotten that although the court of Byzantion was Latin in origin and in name, yet it was from the beginning Greek in the language and traditions of the people. Latin, indeed, was the official language of the court, but not of the inhabitants. The new Christian civilization, though hostile to Hellenic paganism, was not hostile to Hellenic philosophy and wisdom, which it had adopted and appropriated. A new epoch of Hellenism had begun, Christian Hellenism, which after a time was destined in some ways to eclipse even classic Hellenism.

It is certain that during all the long ages from Theodosios and Justinian down to the fall of Constantinopol, the Christians of the East were superior to the Christians of the West in education. This is exemplified by such facts as the great codifying of the laws in the time of Justinian, the councils of the church, which were held in the East, the various heresies that arose among the Eastern peoples (people that do not think are not liable to fall into heresy), the many scholars who continually came to the West with Eastern lore and books, the Byzantine learning which the Arabs brought into Europe, instances of kings and princes who sent their daughters to the Eastern capital to receive that polish which the Western world could not give, Western scholars who went to the East to study despite the jealousy between the two great churches. These facts all go to show the higher position which the East held in culture and knowledge.

In 1240 John Bassing, archdeacon of St. Albans, brought a number of Greek books into England from the East, from Athens.

It must not be thought that the transition from paganism to Christianity was in every respect a violent one. A good illustration of how easy such a transition became in some cases is seen in the writer Nonnos, who, during the first half of the fifth century as a pagan writer, produced profane works, taking his inspiration from classic antiquity, and creating such monstrosities as the Dionysiaka, and who later as Christian added to his writings a paraphrase of the Gospel of St. John. (Kœchly, De Evangelii Joannei paraphrasi a Nonno facta. Zurich, 1860.)

The educated Christians would have had no ill-feeling whatsoever against the ancient learning if they did not fear its undue influence over the less educated. As an illustration of their love for classic truth and beauty take St. Basil's treatise on the use of the pagan authors. (Sermo de legendis libris gentilium; ed. Migne, pp. 563 ff.)

EDUCATION IN CONSTANTINOPOL.

According to Georgios Kodinos (de Origg. Constant. ed. Paris, p. 42), Constantine founded in his new city an institution for higher learning. As described by Kodinos, this institution bears a certain resemblance to a modern university. For the purposes of this school Constantine built a special edifice, the Tetradision. Twelve teachers lived in it, all of whom were in orders. The director of the school had also the care of the library, and of the church archives. Both director and professors were called œcumenical teachers, *οἰκουμενικοὶ διδάσκαλοι*. The young Julian,[1] who, in 361 became Emperor, may have studied in this school. At least when about 20 years of age he came to Constantinopol from Kappadokia to study. Constantine gave him the best opportunities to study, but forbade him to attend the lectures of the pagan Libanios lest this teacher might exercise an evilly alluring influence on the religion of the enthusiastic young Hellenist. The fact that Libanios taught for a time in Constantinopol shows that there were other excellent schools beside the one in the Tetradision. Julian, after becoming Emperor, enriched the library of Constantinopol by adding his own private collection of books to it. This library was probably the one which the director of the Tetradision had care of. The Emperor Valens (364-378) appointed seven antiquarii to copy manuscripts here.

The Emperor Theodosios, who also cared much for his capital city and who despoiled many another place of its objects of art and wealth in order to beautify and enrich Constantinopol, likewise busied himself to make it a more noted center of education. He reorganized, remodeled, and reinvigorated the school which Constantine had founded. It came into a new existence by virtue of a decree of the year 425. The school exercises were held in a large edifice called the Kapitolion. Ten grammatici taught the Latin language, which was still the official language of the Government. Ten other grammatici taught the Greek language. Three professors taught Roman oratory, and five sophists gave instruction in Greek rhetoric. One professor taught philosophy, and two taught law.

[1] See Randall, The Emperor Julian, Paganism and Christianity. Cambridge, 1879.

These professors were not allowed to teach in private schools, nor indeed in any other school than the university; such teaching was thought to be beneath their profession. After twenty years of teaching a professor received the title of "Comes" of the first order, and was enrolled among the nobility.

In the fire of 476 a library of 120,000 volumes is said to have been destroyed by the burning of a wing of the Tetradision. This shows what a quantity of books were already in Constantinopol. A story says that in this fire there perished a manuscript of the Iliad and Odyssy, written on serpent skin in letters of gold.

In the year 740 the Emperor Leon of Isavria closed the chief school of Constantinopol. He did so because having requested the faculty to render an opinion concerning Ikons, the faculty declared that the use of Ikons should be continued, an opinion which did not suit the purposes of the Ikonoklast. (See Walch, Geschichte der Ketzereien, Vol. x, p. 231). Later and unreliable tradition asserts that he caused the school to be burned, together with professors and apparatus and library.

During the reign of Michael III (842–867), the last Emperor of the House of Leon, the university was reestablished after having been closed for more than a hundred years. The hundred years that fall within this period are among the darkest in the intellectual life of the Byzantine Empire, and yet there was not even then absolute dearth of noteworthy scholars. At the beginning of this period we find Ioannes, of Damaskos, whom the synod of 754 cursed in his grave. Scholastic philosophy, which flourished so greatly in the West at a later date, owes very much to Ioannes of Damaskos. The Greek Church, up to the present time, regards him as its greatest dogmatic theologian.

The rebirth of learning in the time of Michael III was due in large measure to Bardas, the coregent with Michael. But even before the reign of Michael this renaissance had really begun. The Emperor Theophilos (829–842) had opened a philosophical and mathematical school, and located it in one of his palaces, the Magnaura. A strange event happened in his reign. The Kalif Al Mamoun sent to Theophilos a special embassy, asking that the teacher Leon be allowed to leave Constantinopol and go to Al Mamoun's capital city to teach. The Greek Emperor was surprised to learn that he possessed such a teacher. He made inquiries and discovered that Leon was teaching in a small private school. Theophilos refused to permit the newfound treasure to escape him. He immediately appointed a suitable place for him to teach in. Leon afterwards did much in encouraging the founding of schools, not only in Constantinopol, but in other parts of the Empire. He was of much assistance to Bardas in this work.

In the year 1045 the Emperor Constantios Monomachos interested himself in a school for higher studies. Whether this was a new foundation or a reorganization of the school already existing is hard to ascertain. There were some worthy professors in this school, among them Michael Psellos, who occupied the chair of philosophy. He taught Plato with success. Among his hearers were not only Byzantines, but also Arabs and Western Christians.

One of the principal departments in this school was that of law. This law school did good work in preserving and spreading a correct knowledge of Romæo-Byzantine law. This was really the first establishment of a genuine law school as we now understand such a school. It preceded the school of the West, that of Bologna, by half a century. Zachariae von Lingenthal, a famous authority on Byzantine laws, declares that the makers of the law school of Bologna were influenced by the model at Constantinopol. The law school of this academy of Constantinopol was founded by virtue of a "novella" *περὶ τοῦ νομοφύλακος*. Its first director, *νομοφύλαξ*, was Ioannes Xiphilinos, of Trapezous, who later became Patriarch of Constantinopol.

The numerous law manuscripts still extant from the eleventh and twelfth centuries show how fruitful this school was. (See Geschichte der Byzantinischen Literatur, von Karl Krumbacher, p. 606.)

This revival of learning came to a sudden end in 1204. In that year the wild western Franks took possession of the city. Their rude contempt for all that was

concerned with literature, or the polite culture of the East, is fully testified to by Niketas Choniates (p. 382, ed. Paris). He tells of how the soldiery carried writing material and books through the city, mocking the Greeks as being a nation of book men.

After the expulsion of the Latins in 1261, the cause of education was again patronized by the Emperors of the house of Palæologos. But the Empire was in the way to death, and these late scholars' chief good work was that they preserved what was left of literature, and carefully handed it over to the reawakening West, which received it and cherished it, and through it developed into what it now is.

THEOLOGY.

European theology as a science owes itself to Christianity. Theological science, as met with in the Byzantine Empire, and as crystallized into the teachings of all Christian denominations of modern Europe, especially, however, the teachings of the Greek and Latin churches, is a product of the meeting of two streams—Christ's divine teachings and Greek wisdom.

Down to the twelfth century theological literature, and church literature in general, stood higher in the East than in the West. There was in the East no violent break between the patristic literature and the Byzantine ecclesiastical literature. In the West, however, there was such a break, caused by the invasions of the barbarians and the destruction of the old Latin civilization.

THE TEACHING OF GRAMMAR.

Since the habit of forming all literary style on the basis of the classic writers still continued to prevail, it was natural for the Byzantines to continue to use the old grammarians of the Atticistic period as their teachers in the use of words, phrases, and constructions.

During this entire period we find the old works of Dionysios Thrax, Apollonios Dyskolos, and Herodianos used as the authorities in grammatical teaching. These works were not read in their original form so much as in epitomes and commentaries. Among the best known commentaries were those of Theodosios of Alexandreia made in the fourth century, and those of Ioannes Philoponos, Ioannes Charax, and Georgios Choeroboskos made in the seventh century. These books continued in use down to the fall of Constantinopol.

THE STUDY OF RHETORIC.

The art of composition was a specially beloved study. Accordingly the number of manuscripts of text books on rhetoric is very large. Most of them are of little value. They are all outgrowths of such works as those of Hermogenes and Aphthonios, who flourished in Roman times. These text books follow the old system in vogue with rhetoricians of the preceding period. They train the student to compose various kinds of themes in the following order: Fables, *μῦθοι*; narratives, *διηγήματα*; chriæ, *χρεῖαι*; refutations, *ἀνασκευαί*; argumentations, *κατασκευαί*; *γνῶμαι* or enlargements on sententious sayings, and character sketches, *ἠθοποιΐαι*. (See Walz, Rhetores Græci, Stuttgartiæ, 1832–1836, or Spengel, Rhetores Græci, Leipzig, 1853–1856.

HISTORY.

No other people of Europe possess such a long and unbroken series of historical literature as do the Greeks. It begins with Herodotos, in the fifth century B. C., and comes down to Laonikos Chalkondylas, whose ten books of histories end with the year 1463, and from Chalkondyles down to the present day. Much of this historical matter has not yet been published, and most of it has not yet been critically examined.

MATHEMATICS AND ASTRONOMY.

Byzantine culture did nothing for mathematics. Stephanos of Alexandreia, who lived in the time of the Emperor Herakleios (610–641), was the last of the old line of mathematicians. After him up to the age of the Palæologs we find no writers or teachers skilled in these sciences. This Stephanos was public professor, οἰκουμενικὸς διδάσκαλος in the University of Constantinopol.

With the efforts at intellectual revival that took place under the Palæologs, after their return to Constantinopol in 1261, there came also a new life into mathematical and astronomical studies. The principal impulse to these studies came at this time from the Arabs and Persians. Translations of Arabic and Persian works were made, and original works were written under Arabic and Persian inspiration.

In the year 1325 Nikephoros Gregoras presented to the Emperor Andronikos Palæologos the details of a plan for the correcting and improving of the calendar. But the Emperor, fearing that the change might not be acceptable to his people, did not accept it.

MEDICINE.

In the science and practice of medicine likewise the Byzantines made no important progress. The books from which they studied were the writings of the old masters, especially Hippokrates and Galenos, either entire or more usually in excerpts and epitomes.

Nevertheless Alexandros of Tralles (525–605) produced a work on pathology in twelve books, in which he shows himself not only an intelligent follower of the masters but an independent thinker as well.

In the seventh century we find Paulos of Ægina, who wrote a handbook of medicine which contains much that was new, especially in surgery. This work was regarded as of such importance as to be translated into Arabic, and from Arabic into Latin. It has been translated into English by Francis Adams (three volumes, London, 1845-1847).

Toward the end of the thirteenth century Nikolaos Myrepsos wrote a book of prescriptions which was thought to be so useful that it enjoyed great reputation in the West, and held its place as a well recognized "codex pharmaceuticus" of the faculty of Paris as late as the beginning of the seventeenth century.

Among the working classes it is quite probable that but few of the women could read. Among the men, however, such ability may not have been uncommon, since school and teachers, public and private, lay and clerical, were plentiful. Among the middle and upper classes general education, ἐγκύκλιος παιδεία, was a not uncommon acquisition for women as well as for men.

CONDITION OF EDUCATION AMONG THE GREEKS FROM THE FALL OF CONSTANTINOPOL IN 1453 DOWN TO THE WAR OF LIBERATION IN 1821.

The fall of Constantinopol naturally affected the condition of education in the Byzantine Empire. The Turks, though not always openly hostile to Byzantine education and culture, looked upon it with disdaining indifference. For them the Koran was sufficient. Yet they did adopt some of the outward and moribund forms of Byzantine culture. For example, they accepted Byzantine architecture in the building of their mosques. They did not interfere in any direct way with the education of such Christian inhabitants of the Empire as could pay liberally for the privilege. They did not refuse to sell permission to found schools; they did not silence the teachers, nor did they forbid the transcription of books. Yet the simple fact that these Christians were not free men; that they lived under a Government which they regarded as a punishment from God, and which treated them as merely tolerated aliens; the fact that no career was, under ordinary circumstances, open to the scholar save that which the church afforded; the fact that the people were plunged in the abjectest poverty; the fact that it was a dangerous thing for a parent to make his children too attractive by education or otherwise, because he thus increased the risk of their being appropriated for some harem or band of eunuchs or janizaries—all

these facts weighed heavily on the cause of education. Every four years a certain number of small Christian boys were taken from their parents to be trained as janizaries. The very existence of this child tribute, the heart-breaking *Παιδομάζωμα* (see the drama of this name by Demetrios Kampouroglos) and the tax of one-tenth of the male children for employment in various offices, threw such a foreboding gloom over family life that education could not well flourish, even if there were no other causes to prevent it. The Pædomazoma dates from about 1650.

Instead of not understanding the humble condition of education among the Greeks under Turkish rule, we are astonished to find so much of education there; astonished at the vitality of old Hellenism which did not entirely succumb even to Mahometanism.[1]

Hellenism seems to be one of these mighty forces of nature which when forcibly stopped in its regular flow will burst out in outlets into other directions. Thus one effect of the enslavement of the Eastern Empire was the great exodus of scholars from Constantinopol and Asia Minor and Thessalonika and Sparta, etc., into Italy and the other countries of western Europe. This stream of learning, oozing westward from its oriental sources, burst forth in Europe into a myriad of life-giving fountains, causing to spring up everywhere a new growth, a new zeal for the historic past, a new impulse and love toward things of beauty and truth, a new freshness and ambition and humanitas—in a word, a revival, a rebirth, of Hellenism, the Renaissance.

To follow these scholars from the East to the West and to examine into how they partook in bringing about the great revival would lead us away from our theme. Yet we can not say that their work was lost to their fatherland, because this powerful civilization of Europe has never ceased to shine back toward the source whence it came, and in these later days, when liberty has again taken up her abode in some of her old Hellenic centers, scholars from Europe, heirs to classic and Byzantine Hellenism, have been found ready to bring back to its home fresh seeds of the ancient culture. Yea, when under the dawn of a new life a university was opened in Athens, Europe furnished some of its best professors.

However, although the scholars that migrated to Europe are outside of our pale, yet, since they are better known to us than are those who stayed in their native land, I make this reference to them here; they serve as samples of what high scholarship flourished in a country that could produce such men. For details concerning them one must go to the history of culture and education in Europe during those times.

After the fall of Constantinopol the Greeks, as a nation in slavery, attracted very little attention in western Europe. In 1573 Martin Kraus, professor of Greek at Tubingen, moved by the correspondence that had been opened up between Protestant leaders and the ecclesiastics of the Greek Church, began to correspond with some Greek clergymen of Greece and Constantinopol. This correspondence he publishes in his Turcogræcia. It is easy to see that the Greeks of that day were almost unknown even to him. He asks whether Athens still exists, etc. But his correspondence was soon followed by a general awakening of interest in the East, and gradually toward the end of the eighteenth century the Greeks were again favorably before the world.

THE COMMON SCHOOL.

(Τὸ Κοινὸν Σχολεῖον.)

The schools of this period may be divided into two classes, the common or primary schools, and the Hellenic or advanced schools.

Since there were very few careers open to the educated Christian except that of an ecclesiastical life, the school naturally came under the special protection of the church. The school was regarded as a kind of succursal to the church. Accordingly the books used were chiefly such books as were needed in the daily service of the church, such as the Ἀπόστολος, the Psalter, the Ὀκτώηχος, and the Μέγα Ὡρολόγιον.

The sum total of what one could learn in a common school consisted in ability to read the books of the church service, in knowing the elements of arithmetic, and ability to write.

There were no buildings especially fitted out as schools for scholars of this class. They would assemble in the narthex of some church, perhaps, when their teacher was an ecclesiastic, or in the shop of some handicraftsman when he happened to be the school-teacher. They had no chairs, but sat crosslegged on mats or rugs laid on the floor. Their books were of course in manuscript, since the art of printing was not yet at their service. Each pupil usually had but one book. He was promoted to a higher grade by being allowed to take up a different book. The occasion on which a young boy was allowed to "change his book," *νἀλλάξῃ φυλλάδα*, as they used to say, was joyfully celebrated by his family and relatives. He was led in triumph from the school to his parents' house accompanied by the teacher and his fellow-schoolmates and his relatives. On arriving at the house all formally congratulated him and feasted and sang and danced in his honor. In the evening his mother sent to the teacher the gift of a fowl or eggs, or a piece of wearing apparel, to show the gratitude of the family. (See Χρόνος Νεολόγου, p. 150.)

The teacher was often a priest or deacon or other ecclesiastic, or the sacristan of the church, or a tailor or a shoemaker, or some other such handicraftsman who could both ply his trade and teach at the same time.

The schools were generally held in the daytime, but in the communities where the pupils were engaged in labor during the day night schools were sometimes held. A reference to these occasional night schools is contained in a song which used to be sung in those days and is still widely known throughout Greek lands:

Φεγγαράκι μου λαμπρό,
Φέγγε μου νὰ περπατῶ,
Νὰ πηγαίνω στὸ σχολειό,
Νὰ μαθαίνω γράμματα,
Τοῦ θεοῦ τὰ πράμματα.

(See the periodical Φιλίστωρ of Athens, Vol. I, p. 273.)

THE HELLENIC SCHOOL.

(Τὸ Ἑλληνικὸν Σχολεῖον.)

Along with the common schools there flourished another set of higher schools, called Hellenic. They took their name from the fact that in them the ancient Greek language, Ἑλληνικὴ γλῶσσα, was their chief study. In these schools the pupils studied ancient grammer and read and interpreted the ancient authors, both classical and ecclesiastical. Although the most of the boys that entered these schools, after finishing the course given in the common schools, were looking forward to a church career, yet there were others who intended to remain laymen. These Hellenic schools were of various degrees of excellence and thoroughness, according to their resources and the worth of the teachers they chanced to have. That some were of a high order is evident from the eminence of the scholars they produced. We shall have occasion to mention some of these scholars later. Alexander Helladios, speaking of these schools (in his Status Præsens Ecclesiæ Orientalis, p. 42 ff.), praises them and honors them with the peculiar title of "Universitatulæ." Schools of this high order existed in Constantinopol, Smyrna, Kydonia, Ioannina, Patmos, Athos, Thessalonika, and elsewhere. They were not universities, because they did not possess all of the schools that go to make up a studium generale, still some of the branches taught were handled as thoroughly as in contemporaneous western universities. (See Chassiotis, L'Instruction Publique, etc., p. 34.)

After the fall of Constantinopol there grew up around the residence of the patriarch a community of Greeks known in history as the Phanariotes, Φαναριῶται. They take their name from the quarter in which they lived, and the locality takes its name from a light-house, Φανάρι, which stood there at the edge of the water of the Golden Horn. From these Phanariote families the Sultan chose Christian governors and other officers needed for the administration of Christian provinces. Phanariotes were also employed as interpreters, etc., for intercourse with European governments. Phanariotes and Patriarch were usually well treated by the Sultans and enjoyed many privileges. Though obsequious to the Mahometan Government, they always continued true to the traditions of their own race. They established in Phanari an educational institution called the Grand National School, ἡ Μεγάλη τοῦ Γένους Σχολή. (See Χρονικὰ τῆς Πατριαρχικῆς Ἀκαδημίας· ἱστορικαὶ εἰδήσεις περὶ τῆς Μεγάλης τοῦ Γένους Σχολῆς. ὑπὸ Μανουὴλ Ι. Γεδεών. ἐν Κωνσταντινουπόλει αωπγ.)

This school had at times noted teachers and produced noted scholars. Theophilos of Korydala taught here when Kyrillos Loukaris was Patriarch. He has left us a bulky commentary on the writings of Aristotel.

In 1804 this school was removed from Phanari to Kourou-Chesme, a suburb of Constantinopol. (See the Ἑβδομάς for May 11, 1886.) But after a few years it was again brought back to Phanari, where it flourishes to-day, in a large and well-equipped edifice built especially for the purpose, and dedicated September 12, 1882.

These prosperous and influential Phanariotes patronized schools not only in Constantinopol, but also in other parts of the Empire. The Mavrokordatos family may be taken as an illustration. Alexandros Mavrokordatos, who had studied in Padua and Bologna, became professor in a Greek school in Constantinopol founded by Manolakis, an important school, distinct from the patriarchal school, which also existed at that time. He wrote a noteworthy treatise on the circulation of the blood, a Greek grammar, a text-book of rhetoric, a history of the Jews, history of Rome, etc. He encouraged the founding of schools and assisted according to his ability. He strove for the purification of the modern language and for its adoption as the literary medium. His children naturally followed his example. His oldest son was appointed to the position of hospodar of Wallachia, being the first Greek that ever occupied that office. One of his early acts as hospodar or governor was to establish a well-equipped school in Bucharest, and to found a printing establishment.

Generosity in the cause of education was characteristic of other rich Greeks also, as well as of the Phanariotes; so that the number of schools in good standing throughout the Empire was really remarkable. We find schools flourishing at some time or other during this period at the following places: Arta in Epeiros, Ampelakia in Thessaly, Mount Athos, Athens, Bucharest, Chios, Constantinopol, Chalke of the Prinkipo Islands in the Sea of Marmora, Demitsana in the Peloponnesos, Jassy, Jerusalem, Ioannina, Kydonia of Asia Minor, Leghorn, Lakka of Delbino in Epeiros, Moscow, Malenik of Makedonia, Missolonghi, Nikomedeia of Asia Minor, Odessa, Patmos, Padua, Rodosto, Serræ of Makedonia, Smyrna, Thessalonika, Tyrnabos, Tsaritsana, Triest, Venice, Vienna, etc.

Some of the schools mentioned above were outside of Greek lands. They were established by the residents of the Greek colonies in these places. Some of them date back to before the fall of Constantinopol. Thus in Padua of Italy we find a Greek school existing in the year 1407.

The above list contains only some of the more noted schools. Many a school existed and perished of which we have no record whatsoever. Everywhere throughout Greece one comes to places which the people of to-day call "the school," τὸ *δασκαλεῖο*, although the locality contains no school or traces of school. The name is merely the memory of long ago.

A good list of the schools flourishing in the eighteenth century is found in a grammar published in Venice by Georgios Phatseas. It contains most of the prominent Greek schools of his time (*Γεωγραφικὴ Γραμματικὴ τοῦ Φατσέα*).

The school at Jerusalem was one of the oldest. It may be regarded as the continuation of the *Μουσεῖον*, which the conquerer Saladin destroyed.

In Smyrna, as in other large Greek cities, there existed often more than one Hellenic school. The most noted school of this city was the Evangelical school, *Εὐαγγελικὴ Σχολή*. It was founded in 1743 by means of private contributions. It has had a successful career, and has done much for the advancement of learning among the Greeks of Asia Minor. It still flourishes. It possesses a splendid library and an archaeological museum. Since 1873 the school has published a periodical, the *Μουσεῖον καὶ Βιβλιοθήκη τῆς Εὐαγγελικῆς Σχολῆς*. This periodical contains good archæological, historical, and philological material.

The Island of Chios enjoyed more freedom than many other places in the Turkish Empire. On this account education had greater opportunity of spreading than elsewhere. There was no break in the chain of schools in this island from the time of the passing of the island into the hands of the Turks down to the massacre of 1821. Monks of the West vied with scholars of the East in diffusing education. During these four centuries we continually find Chians among the learned men of the time.

Near the shores of the Ægean, on the coast of Asia Minor, opposite to the Island of Mytelene, there flourished a beautiful little Greek town, Kydonia, the village of the citron trees. But this town is known to us more for its school than for its beauty. The school was founded by Gregorios Saraphis.

Among the young men that studied at Kydonia was Ambroise Firmin Didot. In the year 1817 he made an extensive tour through Greek lands, and, coming to Kydonia, he entered the school as a regular pupil. He brought with him a letter of introduction to Kaires, who was then professor there. The letter was from Korues. Didot remained an intern of the school for two months. He was young and enthusiastic and noble. He became the leading spirit in a society established by the students, all members of which agreed never to speak to each other except in Attic Greek. In his notes (Notes d'un voyage fait dans le Levant en 1816 et 1817, Paris, 1821) he gives us a copy of the "vow" they took. These notes contain many delightful reminiscences of his sojourn among the fiery young Greeks of Kydonia. (See Annuaire des Etudes Grecques, 1876, p. 233 ff.) A few years later Didot sent to Kydonia a full printing outfit.

In the monasteries at Mount Athos learning always held a certain footing; but it was available chiefly for monks only and their novices. In 1749, however, a change

took place. The monks of the monastery of Batopedion decided to open a school on a more liberal plan. They invited Neophytos Kavsokalybites to be its first scholarch. He accepted. The school was a success. As one of the men who taught here, Evgenios Boulgares, of Kerkyra (1716–1806), may be mentioned. He was a typical Greek scholar of his day. As classicist and Christian he translated two works into Greek—the Æneid of Vergil and the Confessions of St. Augustine. He afterwards enjoyed the patronage of the Empress Katharine and was made bishop of Kherson.

Ioannina (Janina), known to us as the chief city in the country ruled over by the celebrated Ali Pasha at the beginning of the present century and often mentioned by Byron, was highly favored by schools. Epiphanios Hegoumenos, who in 1647 founded a school in Athens, founded one at Ioannina in the same year. Later this school received other gifts and was a useful institution.

In the year 1676 another school was established in Ioannina, the founder being Manos Ghionmas, who gave 20,000 ducats for that purpose. This school also received other gifts and became an excellent school.

Still another was founded some years later by Simon Maroutsos. In this school Evgenios Boulgares taught for a time before going to Batopedion of Mount Athos.

The schools of Ioannina are noted for the number of teachers they produced.

In the mountain town of Demitsana, in the Peloponnesos, we find a school which since the year 1764 enjoyed the reputation of being one of the best schools of Greece. In this year the learned Agapios reorganized the school. Scholars came to it from all parts of the Peloponnesos. It has the glorious reputation of having educated Germanos, who afterwards, when bishop of Patras, was the first to unfurl the Greek flag and gave to the revolution of 1821 the character of a holy war for liberty and church. This same school educated Gregorios, who as patriarch of Constantinopol was murdered by the Turks in Easter week of 1822.

After the fall of Athens into Turkish control we have very scanty data concerning the condition of education. But on account of the historic importance of the city it is worth while to collect as many facts as possible.

The first reference to a school brings us to the year 1647, when Epiphanios Hegoumenos, a Greek of Venice, who had also contributed to education in Ioannina, founded a school in Athens. The reason why Epiphanios selected these two cities was probably because they were already in a certain way centers of education. In the following century the school of Epiphanios was still flourishing, as we find that in the year 1732 it received a gift from the Athenian Georgios Melos. This gift from Melos was in the form of a yearly income, and was intended to support one teacher and a small number of scholars.

That there must have been some culture in Athens at this time is to be concluded from the account which Père Babin, the Jesuit, has left us; for he highly praises the love of learning which he observed among the Athenians. This statement is in his Relation de l'État Présent d'Athènes, ancienne capitale de la Grèce * * * par Père Babin. 1674. (It has been published by Spon, and also by Laborde.)

Almost a century later Gregorios Soteres, a monk who had studied in Italy, returned to Athens and bought a house, which he converted into a school, where he himself taught the *εγκύκλια Γράμματα*. All of this he did at his own expense, receiving no salary and taking no fees from the pupils. When in 1782 he left Athens and went to Constantinopol, he dedicated his school to the community of Athens "to be and to be called a common academy of Greek learning, and to serve as a habitation for the successive teachers." This school continued to exist up to the year 1812. It was situated in the middle of the city, near to the Tower of the Winds. (See the article in the *Ἑβδομάς* for November 10, 1885, on *Τὰ ἐν Ἀθήναις πρῶτα Σχολεῖα*.)

About the year 1750 or 1754 another Greek of Venice, Ioannes Dekas, established another school at Athens, and deposited in the treasury of the Aristocracy of Venice the sum of 2,000 ducats, from the interest of which the school was to be supported. He provided for one teacher, with a salary of 200 ducats, and for twelve scholars

who were to receive each 25 ducats yearly. This school flourished until 1797, when, by the fall of Venice (in this year Venice submitted to Bonaparte, and at his orders the Aristocracy was abolished and a provisional government established), it was deprived of its revenue. It did not cease to exist, however, but struggled along to the year 1805, when it received new life from support given to it by the monastery of the Παμμέγιστοι Ταξιάρχαι. (See the sigillion in Τὰ κατὰ τὸν Αοίδιμον Γρηγόριον τὸν ἐ. ἐπὸ Γ. Π. Αγγελοπούλου ἐν Ἀθήναις, 1865, vol. II, p. 488.) With this new assistance the school continued to exist up to 1813 and perhaps later. (See Εβδομάς, loc. cit.)

In the year 1813 Petrakes, the hegoumenos of the Monastery of the Angels (τῶν Ἀσωμάτων), established a school of medicine in the monastery. The physician Dionysios Pyrrhos was the teacher. From the revenues of the monastery twelve scholars, as well as the teacher, were supported. The school continued to exist until the outbreak of the revolution in 1821.

DIDACTIC METHODS.

In the common schools the methods used for inculcating knowledge were quite primitive. Each pupil had his task to perform, and woe to him for all neglect. The punishment that awaited all ill success was the φάλαγγας, or the rod. Teacher and parents often repeated the philosophic Τὸ ξῦλο βγῆκε ἀπὸ τὸν Παράδεισον, "The rod is a gift of God." The parent often allowed full penal jurisdiction over a troublesome son, with the simple proviso Μόνο τὰ κόκκαλα γερά, Δάσκαλε, "but don't break any bones." (See Kondylakis's Πατούχας, cap. 1.) Each pupil prepared his task as best he could, either unaided or with the assistance of a more advanced pupil, a Πρωτοσχόλης. The lessons were usually conned aloud, and one of the chief duties of the schoolmaster was to shout "silence" when the droning grew too noisy.

For recitations, a system was in vogue by which the master heard the lessons of the more advanced pupils, and these the lessons of the inferior scholars. This method, by which the better scholars were both pupils and teachers, goes in Greek pedagogy under the name of the ἀλληλοδιδακτικὴ μέθοδος. On account of economic reasons it continued popular in Greece, improved into the Lancasterian method, even far down into the days of freedom; and even yet traces of it are to be found.

In the Hellenic schools more order reigned. But here also the Πρωτοσχόλαι, or advanced scholars, assisted as teachers of the younger pupils.

Ancient Greek and Greek literature were the chief studies. No attention whatsoever was paid to the study of the various vernacular dialects of their time. Whatever was not good ancient Greek was faulty language. The only grammar studied was that of the ancient Attic.

In the latter half of the eighteenth century Hellenic education among the Greeks was in its most flourishing condition since the fall of Constantinopol. Scholars began to devise better means of instruction. Pedagogics began to be studied. European systems were attracting attention, Koraes, in his Αυτοσχέδιοι Στοχασμοί, speaks of the new notions of Pestalozzi and his reforms in the practice of education, and says that although he does not know whether Pestalozzi was improving the system of education or not, yet he thinks that the Greek community of Constantinopol ought to send two young men to Europe for the purpose of studying the Pestalozzian system and of introducing it into the East if they find it good. (See Pantazides's Παιδαγωγική, IX–X).

THE SCHOOLS AS NURSERIES OF PATRIOTISM.

The warm though smouldering patriotism which was so instrumental in keeping the schools alive, and which was in turn fostered into intense heat by these same schools, is well illustrated by an event which happened one day in the Greek school at Bucharest. Georgios Gennadios was teaching, and this event is described in the writings of Alexandros Rangabes, who was then present as one of Gennadios's scholars. Among the pupils were also the sons of Alexandros Soutsos, hospodar of Wallachia.

Gennadios was interpreting Isokrates's celebrated Panegyric. The teacher read to his students the old sophist's description of the glory and splendor of ancient Athens. Becoming filled with ecstatic fire, he told the students to bar the doors. Then, shut in from all contact with the Turkish world outside, he made a burning comparison between the greatness of the past and the fallen condition of the present. Tears streamed down from his eyes, and every young Hellene present wept and cheered. A few months later many of them followed Gennadios to the war as members of the Sacred Band.

Thus it was that the schools which the dull oppressors allowed to exist, if properly bribed, became each and every one of them a radiating point whence the hope of freedom glinted out. Indeed, it was through literature and through the schools and through the church that the flame at last burst out. The young palikars were fired by the hymns of such as Rhigas, while the more enlightened were whetted into determination by the writings of such as Koraes and the teachings of Gennadios. The drama, as a literary and artistic expression of patriotism that could directly affect the people, could not have opportunity to produce its effect. It was too open to suppression. But yet in 1818 the Timoleon of Zampelios was represented at Bucharest, and assisted in awakening hopes.

THE PHILO-MUSE SOCIETY.

(Ἡ Φιλόμουσος Ἑταιρεία.)

The Philo-Muse Society, or Society of Art Lovers, deserves at least a passing notice.

In 1812 three men, then living in Athens, set about forming a society for the protection of the antiquities of Greece, the founding of a museum, the establishing of a library, and the founding of schools. These three men were Ioannes Marmarotoures, Petros Rebelakes, and Alexandros Chomatianos. The constitution of the society is published in Konstantinides's History of Athens. (*Ἱστορία τῶν Ἀθηνῶν ὑπὸ Γεωργίου Κωνσταντινίδου. Ἀθήνησι*, 1876, pp. 557 ff.)

The plan met with favor among the foreigners resident in Athens, as well as with the more prominent Athenians. Accordingly in 1814 the society came into existence with Ioannes Kapodistrias, later governor of Greece, as its president. Kapodistrias was at that time in the service and high friendship of Alexander of Russia; and through Kapodistrias's influence the Emperor of Russia, the Crown Prince of Bavaria, the Crown Prince of Wurtemburg, and others of high rank, became members. But the war broke out and put an end to the good intentions of these Hellenes and Philhellenes before they could put their intentions into practice.

FIRST GREEK BOOKS PUBLISHED.

One of the first books published after the inventing of printing was the grammar of Konstantinos Laskaris. It came from the press in the year 1476 in Milan. This grammar remained for a long time the only one in common use. Only after the appearance of Asopios's grammar, and the translations of those of Buttmann and Tiersch, was the grammar of Laskaris finally laid aside.

The first Greek poem ever printed was a paraphrase of the Iliad by a Greek of Zakynthos named Loukanos. The paraphrase appeared in print in the year 1526. It is a tasteless and unscholarly production. The book is illustrated with woodcuts. Achilles is represented as a medieval count, and the priest Chryses is decked out in the cowl and cassock of a western monk.

Within the Turkish Empire it was not easy to begin to print. Accordingly these books mentioned, and nearly all of the other first Greek books printed, were published in Europe.

The Patriarch Kyrillos Loukaris, otherwise well known as a man of innovations, had a printing establishment set up in Constantinopol under the management of

Nikodemos Metaxas, of Kephalenia. But a pamphlet was printed from it attacking some doctrines of the Moslem religion. The surest way to prevent a repetition of the offense was to demolish the establishment. This the Turks did.

LITERARY CONDITION OF THE PEOPLE.

To properly understand the condition of higher education in any nation one should include all of the literature and all of the other media through which higher aspirations and higher success are indicated. But the literature of the period we are now concerned with is not yet accessible to the ordinary scholar. Eminent men like Konstantinos Sathos, Emile Le Grand, and others are opening out this new field to us. The Greek people during these days were not a nation of readers. The books read by the higher classes were chiefly theological, philosophical, and historical treatises. And the writers produced mostly books of these kinds. The commoner people read even less, of course. Still a book was with them a sacred possession. Such books as they had were mostly in manuscript. Printed books were scarce. It is interesting to note in the epistolary correspondence between Greeks sojourning in Europe and their friends at home that their friends are continually asking for books from Europe. Books most read by the common people were, the books of the church service; the Salvation of Sinners, *Αμαρτωλῶν Σωτηρία*; Bertoldi's Stories, *Ιστορία τοῦ Μπερτόλδι*; the *Χρονογράφος*; the writings of Damaskenos; the Erotokritos, and the history of Alexander the Great, *ἡ φυλλάδα τοῦ Μεγάλου Αλεξάνδρου*. These books could be found ready for sale in the ordinary shops where the ordinary necessaries of life, food, clothing, implements, etc., were for sale. They could be also copied to order by some scholar, or in some monastery.

The man who knew how to read and write was proud of his acquirements. He often carried in his belt ink, pen, and paper as insignia of his attainments. Also the child of the family that was picked out by its parents to become the scholar was an object of pride to parents and relatives. It was not an uncommon sight to see the little "*γραμματισμένος*" reading to his parents and brothers and sisters the wonderful stories of his *φυλλάδα*.

Illiteracy was more prevalent among the women than among the men. The fact that learning led chiefly to church preferments, and that learning was, after all, a masculine affair, prevented the establishment of schools for girls. Whatever of letters a girl learned she got from her own home or from some nunnery. Nunneries were quite numerous, and in them letters were not neglected. Parents often placed their daughters in these convents during their girlhood.

CONDITION OF EDUCATION FROM THE CLOSE OF THE WAR OF LIBERATION DOWN TO THE PRESENT TIME.

THE IONIAN ACADEMY.[1]

The Ionian Islands lie along the western shore of Greece. They passed out of Turkish into French control in 1797. The French retained possession of them for two years. From 1799 to 1815 they were under Russian suzerainty. Then they became an English possession, and remained such until 1864, when they were allowed to take their proper place and become a portion of the Greek Kingdom.

The successive owners of these islands all interested themselves in the matter of

Περὶ τῆς ἐν ταῖς Ἰονίοις νήσοις ἐκπαιδεύσεως κτλ., ὑπὸ A. M. *Ἱδρωμένου* in the *Ἡμερολόγιον Ασωπίου* 1873, pp. 215–226.

Σημείωσις περὶ τῆς Ἰονίου Ἀκαδημίας ὑπὸ Σ. Κ. Σακελλαροπούλου in the *Δελτίον τῆς Ιστ. καὶ Εθν. Εταιρ.* I, pp. 263 ff.

La Coltura Ionia, by De Biasi, in La Rassegna Ellenica, Nos. 2–10.

public instruction. The French, in 1797, immediately took steps toward organizing a regular system of schools. They established elementary schools throughout the islands, and in the capital, Kerkyra, they founded a military school, a library, and a printing house.

The Russians, in their turn, patronized education. Under the Russians the islands were practically independent. The sovereign government was represented by a plenipotentiary. From this period we have two medals struck in Kerkyra in the year 1806 showing the zeal of the plenipotentiary and of the local government for the cause of education. These medals were intended as rewards to be given to diligent students. One was the gift of the senate of the Heptanesian state and the other the gift of the Plenipotentiary Mocenigo.

In the year 1808 an academy was founded at Kerkyra under great hopes and great enthusiasm. In the pompous announcement proclaiming the creation of the academy the modern methods of dating were discarded, and the year 1808–1809 indicated as the Six hundred and forty-seventh Olympiad.

This academy, though not destined to a long life, yet did some good work, and desired to do still better. In the Ἁγιος Ἑρμῆς of 1812 (pp. 193, 194) is published a set of questions which the academy sent out "to travelers and educated men, and especially to wise and educated Greeks." The questions are:

(1.) What and how many schools, libraries, and other such institutions intended for the education of the people have been established in the different parts of Greece since the fall of Constantinopol down to our own times?

(2.) What schools or kindred institutions have the Greeks established outside of Greece for the schooling and educating of their countrymen?

(3.) Are the printing establishments of Moschopolis, Jassy, and Bucharest the only ones in Greece? Is it true that there existed a printing establishment in Phanari of Constantinopol? How long did that printing establishment exist which was in the Patriarchate at Constantinopol during the war between France and Turkey?

(4.) Information is asked for concerning the life and the writings of such educated Greeks as flourished since the fall of Constantinopol. (See preface to Sathas's Νεοελληνικὴ Φιλολογία.)

In 1815 the English came into possession of the Seven Isles. England governed through a commissioner, or harmost. Of these harmosts, Thomas Maitland was one. He took special interest in the good progress of the islands. He set about establishing a new academy or college. He caused Count Guilford to be appointed rector. The new academy was formally established in 1828 at Kerkyra. (See Ἑβδομάς for September 7, 1886.)

Guilford was not only a Philhellene, but was also generous and good and scholarly. His motto was, La vertu est la seule noblesse. Knowing the lack of wealth that then, as always, afflicted Greece, τῇ Ἑλλάδι πενία σύντροφος αἰεί, he himself generously bore all the expenses of such young Greeks as would otherwise be unable to pursue their studies at the academy. He remained at the head of the academy until June of 1827. He died in October of the same year.

In the library of the building in which the academy was located is a bust of Guilford in marble of Carrara, the work of a native sculptor, Pavlos Prosalentes. It was made at the wish of the students, who thus desired to show their feelings of veneration toward their director. It was set up in 1826, while Guilford was still president. Another bust of this generous educator, the work of the sculptor Kalosgeros, has its place now in Athens among those of prominent men of modern Greece.

The students as well as the professors of the Ionian Academy, following the English custom, wore cap and gown.

This academy, useful as it was, became superfluous with the growth and equipment of the new university at Athens. Accordingly, it was finally converted into a gymnasion. The excellent library of the academy is still in the gymnasion.

On account of the important service rendered to the cause of education among the Greeks by the Ionian Academy, it will not be amiss to reproduce here a translation of one of its programmes. From this we can form a correct notion of the work done in that school. This programme is published in the original Greek in the Bulletin of the Historical and Ethnological Society (*Δελτίον τῆς Ἱστορικῆς καὶ Ἐθνολογικῆς Ἑταιρίας*, I, pp. 263–266). An original number of the programme is preserved in the archives of the society.

The programme was published under date of November 4, 1826, in Kerkyra.

IONIAN GOVERNMENT

IONIAN ACADEMY.

The Ephor of the Ionian Academy, Dr. Ioannes Karandenos, makes known that by order of his excellence the Archon of the Ionian Academy the studies for this scholastic year are arranged according to the following plan:

LIST OF STUDIES.

Theology.—Rev. Dr. Konstantinos Typaldos: Dogmatic theology, Tuesday and Thursday, 9 to 10 a. m.; also church history, Saturday, 9 to 10 a. m.; also sacred catechism, Monday, Wednesday, and Friday, 9 to 10 a. m.

Jurisprudence.—Dr. Paschales Karousos: Civil law, daily, 8 to 9 a. m.; also criminal law, daily, 5 to 6 p. m. Dr. Nikolaos Maniakes: National law, daily, 4 to 5 p. m.

Medicine.—Dr. Georgios Therianos: Pathology, daily, 10 to 11 a. m.; also physiology, daily, 9 to 10 a. m. Dr. Stylianos Maratos: Anatomy, daily, 11 to 12 a. m.

Philosophy. (Division A, sciences.)—Dr. Stylianos Spathes: Botany, daily, 12 to 1 p. m. Dr. Athanasios Polites: Experimental and theoretical chemistry, Wednesday and Saturday; on the remaining days of the week, theoretical chemistry only, 1 to 2 p. m. Dr. Ioannes Karandenos: Elements of mathematics, daily, 2 to 3 p. m. Dr. Georgios Ioannides: Philosophy, i. e., psychical anthropology and universal grammar, daily, 1 to 2 p. m.; also the principles of philosophy, or elementary philosophy and logic, daily, 9 to 10 a. m. Dr. Ioannes Aristeides: Ecclesiastical music, five times a week, 4 to 5 p. m.

(Division B, philology.)—Dr. Ioannes Aristeides: Rhetoric, four times a week, 3 to 4 p. m. Dr. Konstantinos Asopios: Greek philology, poetry, daily, 10 to 11 a. m.; also history of ancient Greece, daily, 12 to 1 p. m. Dr. Chrostophoros Philetas: Greek philology, prose, daily, 8 to 9 p. m. Dr. Iakobos Lousinianos: English philology, daily, 6 to 7 p. m.; also English language, daily, 8 to 9 a. m. Dr. Gaetanos Grassetes: Latin philology, daily, 11 to 12 a. m.; also history of ancient Rome, daily, 1 to 2 p. m. Dr. Nikolaos Maniakes: Modern history, daily, 2 to 3 p. m. Dr. Konstantinos Sakerlaropoulos: Greek archæology, lectures for the first session; history of the earliest ages of Greece, chronology, religion, political and private life of the ancient Greeks, Monday, Tuesday, Wednesday, Thursday, and Friday; Greek palæography, diplomatics, and epigraphy, Saturday, 6 to 7 p. m.

By order of the Ephor, Panagiotes Idromenos, chartophylax.

FORMATION AND GROWTH OF THE PRESENT SYSTEM OF EDUCATION IN GREECE.[1]

Inter arma silent Musæ. During the seven years' war for freedom the Greeks naturally could take but little care of education. We are astonished, however, to find them laying plans for an organized system of education, and to hear assemblies composed of klephtic warriors deliberating on where the schools should be established, and to find individuals, old men, priests, and others who were not fit for war, establishing little schools here and there. Yea, within the very Parthenon itself a school was opened in the year 1824 for little tots of girls whose fathers were fighting the war of freedom. We love the Parthenon for its beauty; but it is more worthy of being loved on account of having been a shelter to education than because of being the Parthenon. (See Τὸ *Παρθεναγωγεῖον τοῦ* 1824 *ἐν Ἀθήναις* in the *Ἑβδομάς* for October 24, 1887.)

But not all of these old heroes looked upon education as the best means of insuring their freedom forever. Old Kolokotrones said on a certain important occasion that "books could not be used for better purposes than for gun wads." We forgive him, because Kolokotrones's gunshots were intended to protect home and altar.

As early as the second year of the war the leaders made positive declarations in favor of education. In the Assembly at Astros, in the spring of 1823, they voted that "the education of the youth of the country be reduced to a regular system, and that the Government take steps to have the reciprocal method of teaching introduced throughout the country.

It is true that these declarations were not then put into practical execution. They show not what the Greeks of that time could do, but rather what they would do if they had the means. The Government was powerless to put its aspirations into execution. The war absorbed most of their active measures and resources.

Some of the Philhellenes that went to Greece at that time were as anxious as the Greeks themselves for the immediate systematizing of education. Leicester Stanhope, who arrived in Missolonghi in 1823, forthwith began to agitate the matter of education. In this he was at variance with his compatriot, Byron, who also was at Missolonghi at the same time. Byron wished that Greece first acquire a certain amount of independent existence by means of arms, and that she then turn to education. Stanhope, however, immediately began to put his philosophical plans into execution. (See Greece in 1823 and 1824, being a series of letters and other documents on the Greek revolution by the Hon. Leicester Stanhope. Philadelphia, 1825.) He was a disciple of Jeremy Bentham. He established a newspaper at Missolonghi, published

in Greek and Italian, and edited by Dr. Meyer, a Swiss Philhellene. The motto of the paper was Bentham's saying, "The greatest good of the greatest number." Not only did Stanhope establish this paper and endeavor to establish others in other parts of the country, but he also endeavored to establish schools. These he wished to be conducted on the Lancasterian, or reciprocal plan. But neither Hellenes nor Philhellenes succeeded in establishing a school system at that early date.

That scholarly youths of the best type were not scarce among the Greeks at the beginning of the war is shown by the fact of the formation of the Sacred Band, the Ἱερὸς Λόχος, made up of five hundred students. They wore a uniform of black, and on their standard was the old Spartan motto ἢ τὰν ἢ ἐπὶ τὰν. These five hundred brave boys rallied to the secret call of Prince Alexander Ypsilantis and the Φιλικὴ Ἑταιρία. Some of them were in Gennadios's school at Bucharest. Gennadios was in the midst of his lecture when a messenger rushed into the room with the news that Ypsilantis had passed the Pruth. He threw his books into the fire of the open grate, and rushed off, followed by his students, to join the prince. The young soldiers of the Sacred Band were true to their Spartan motto, and on the 19th of June, 1821, four hundred of them lay as a first holocaust to liberty, dead in their blood on the hill slope of Dragachan.[1]

In the year 1824 the determination to establish a system of education became manifest again. A committee of five, appointed for the purpose, submitted to the Government a plan which provided for the establishment of three sets of schools. The first and lowest set was to comprise elementary and popular education; the second consisted of lyceums, and the third was to contain at least a university. The committee then went on to state that since it was impossible to put the entire system into operation at that time, the Government should give most of its attention to that part which was the most important, primary education, and that in the primary schools the reciprocal system should be employed because of its inexpensiveness; and that a model or central school should be at once established at Argos. The school at Argos was established, with Gennadios as director. But the vicissitudes of war soon interfered, and the school was closed.

After a small quotum of peace came to Greece, and a formal government had been established under Kapodistrias, the school question came up again. Kapodistrias was not at all an advocate of higher education, but favored primary and intermediate. Yet those that impatiently longed for the establishing of an organized system of education had placed high hopes in Kapodistrias. He had been a member of the Philo-Muse Society. He was on intimate terms with many educators of Europe. Among his acquaintances was the celebrated Fellenberg, whose didactic methods Kapodistrias contemplated introducing into Greece, and with this end in view he carried on negotiations in Munich, which resulted in Bader's coming to Greece to undertake the organization of the school system and to introduce Fellenberg's methods. The project, however, did not bear much fruit, and the advocates of learning soon discovered that they would have to push Kapodistrias in this matter instead of being led by him.

So the people at large did not wait for the Government to act. In the year 1828 from the 1st of February to the 1st of May, i. e., within the short space of three months, twenty-two reciprocal schools were established in the towns on the islands of the Ægean, and with no expense whatsoever to the General Government, but solely at the cost of the communities themselves.

From this time on schools multiplied rapidly. According to a report published in the Spectateur de l'Orient for August 22, 1854, 15,000 children were attending school in the year 1829. To appreciate the significance of these figures we must note that the population of Greece then was, according to the same report, only 693,000. This gives 46 pupils for every 1,000 inhabitants. And this was in the year just after the close of the war.

[1] Dragachan was a monastery a few miles distant from Rimnik, in Wallachia.

In 1830 Kokkones, the minister of education, published a report under date of December 30, stating that the number of primary and Hellenic schools then in operation was, in the Peloponnesos 55, in North Greece (Στερεὰ Ἑλλάς) 6, and in the islands 48. These schools were attended by 9,737 pupils. (See Bartholdi-Blachos, II, p. 85.)

Kapodistrias's indifference or rather dislike toward institutions of higher learning was partly due to the fact that he thought the universities of Europe to be hotbeds of revolution. And having been trained in the court of Russia he could have but little sympathy for institutions that would in any way foster too much liberty. His friend and most acceptable adviser in this matter, Alexander Stourtza, held the same views. In the year 1818 Stourtza had published in French a memoir on the present condition of Germany, in which he vigorously attacked the German universities as being seminaries of revolutionary ideas, and advocated the placing of all higher education in the hands of the clergy. Stourtza and Kapodistrias had many a cosy talk over the uselessness and harmfulness of universities. (For a good panegyrical account of Stourtza's life, see Ἀλέξανδρος ὁ Στούρτζας. *βιογραφικὸν σχεδίασμα ὑπὸ Κωνσταντίνου τοῦ ἐξ Οἰκονόμων.* Ἀθήνησι, 1855.)

Kapodistrias had the ill fortune to be disliked not only by many of the educators, but also by the students of the only important gymnasion, that of Ægina, which Kapodistrias allowed to be founded. The students of this central gymnasion openly rebelled in 1831, directly indeed against Mystoxydes and the method of teaching and discipline employed in the school, but indirectly against Kapodistrias himself. How great their antipathy toward him was showed itself on the occasion of his violent death a few months later. They gathered together and sang the song commemorative of the assassination of the Athenian tyrant by Harmodios and Aristogeiton, which the youth of the old Republic of Athens used to sing in classic days:

"Ἐν μύρτου κλαδὶ τὸ ξίφος φορήσω."

Mystoxides, mentioned above, was earnest and active in the cause of education. He was one of Kapodistrias's nearest friends. The Government established a library, an archæological museum, and a museum of mineralogy. Over all of these Mystoxides was placed as president.

During the vice-regency which governed while the young King Otho was in his minority the affairs of education, as all the other important public affairs, were managed by the Bavarian officeholders who had followed Otho to Greece. In order to insure the appointment of fit teachers two committees were appointed, one to sit at Navplion and the other in Ægina, to examine all candidates for the position of teacher in a gymnasium or other public school. But not a single person presented himself before these committees. This lack of applicants was chiefly due to the fact that from the very beginning a strong feeling of dislike to be examined by foreigners, and subservient in all details to foreigners, began to show itself. The unwieldy inadaptability of the German examiners and professors tended to heighten this dislike. The unhappy result was the retirement of some of the Germans after a short period of troublous but highly beneficial work in the newly established school system.

This brings us to a point where we can treat of the different kinds of schools separately.

DEMOTIC SCHOOLS.[1]

(Δημοτικὰ Σχολεῖα.)

In January, 1829, Kapodistrias appointed a committee on elementary education, and to this committee he intrusted the duty of organizing and establishing a system of primary schools. This committee (*ἡ ἐπὶ τῆς Προπαιδείας Ἐπιτροπή*) gave the demotic

[1] See *Θεσμολόγιον τῆς Δημοτικῆς Ἐκπαιδεύσεως ὑπὸ Γεωργίου Βενθύλου. ἐν Ἀθήναις* 1884–1887.

schools the character which they still retain. Kapodistrias himself took great interest in these lower schools. Often he visited them, and spent hours in examining the little fustanelled hopefuls in the alphabet, syllabification, etc. (See Τὸ Ταμεῖον τῆς Δημοτικῆς Παιδείας in the Ἑβδομάς for October 26, 1886.)

In 1834 laws were enacted prescribing in detail how demotic schools are to be established and conducted. They were modeled chiefly after elementary French schools, and are therefore an exception in the system, for all the other schools are after German models.

In the demotic schools the course extends over a period of four years. The studies are the same for boys and for girls. When the number of children that should attend a demotic school is greater than 75, then two teachers are appointed, a man for the boys and a woman for the girls. But when the total number is less than 75, there is then but one teacher, a man, who teaches both boys and girls. When boys and girls have different teachers, then the two schools are usually not under the same roof but in different buildings, and at times in different parts of the town. Children are supposed to begin in the demotic schools at the age of 6 and to attend till the age of 10 completed.

The entire country is quite well supplied with demotic schools. It is almost impossible to find a village of any size which has not at least one demotic school where both boys and girls attend. Melingo, in his Griechenland in Unseren Tagen (Wien, 1893), gives the number of these schools as being about 1,600. This makes one school for about 1,400 inhabitants, a proportion which, as Melingo remarks, compares favorably with the proportion of elementary schools in the Austro-Hungarian Empire. It is easy to understand that in out of the way places these schools are miserably kept. For example of such a school see Ἑβδομάς for June 2, 1890, in the article Σχολεῖον καὶ διδασκαλεῖον. The school there described was most carelessly kept, filthy and unventilated.

Attendance at the demotic schools is obligatory by law. No parents or guardians are legally excused from giving the children under their charge this elementary education. However, instead of sending their children to the public schools, they may send them to private schools of the same standing. This law making primary education compulsory dates back to the year 1834. Since education is compulsory it naturally follows that it is imparted free of cost. It is delightful to remember that this decree for free elementary instruction to all dates back to a decree of the first constitution of Epidavros, while Greece was merely a desert through the devastations of war.

The little children make a pleasing impression on the stranger. They are bright and diligent. They learn with greatest ease. They are obedient and respectful.

They are examined twice a year, in February and during the first two weeks of July. However, when in country places the gathering of the raisins or the harvesting of grain interferes with the attendance of the children at school, then the teacher may transfer the examinations to a later time, but must inform the minister of education concerning the change. These examinations are quite formal affairs, especially the July ones. A committee of five is appointed by the local representative of the Government. The committee always includes the scholarch of the Hellenic school or, at least a teacher from the Hellenic school, and one of the most learned priests of the locality. (For an accurate and delightful description of examinations in a village school see Demetrios Bikelas's Τὸ Σχολεῖον τοῦ χωρίου in his Διαλέξεις καὶ Ἀναμνήσεις, pp. 92-99.) At the close of these July examinations the summer holidays begin. But for the demotic schools the vacation lasts only twenty days.

The teachers in the demotic schools, the δημοδιδάσκαλοι, are appointed directly by the minister of education. Most appointments depend on the political worth of the friends of the candidate. The appointments are made annually. The community to which a teacher is to be sent has little or no direct control over the appointment. Still the local politicians keep to their local teachers as a rule. In a word, although a teacher never knows where he will be next year, yet many of them remain in the

same school for years. Professor Manatt, of Brown University, (see Behind Hymettus, by J. Irving Manatt, in the Atlantic Monthly for May, 1894) met a fine specimen of teacher in Spata of Attica, who had taught there for twenty-five years.

METHOD OF INSTRUCTION.

The details of the method of instruction in these schools are contained in the famous Ὁδηγός, or Teacher's Guide, published for the first time in Ægina in 1830, and since then repeatedly republished with modifications. It was a translation from the French, and bore the title Ἐγχειρίδιον διὰ τὰ ἀλληλοδιδακτικὰ σχολεῖα, ἢ ὁδηγὸς τῆς ἀλληλοδιδακτικῆς μεθόδου ὑπὸ Σαραζίνου διευθυντοῦ τοῦ ἐν Παρισίοις Προτύπου σχολείου * * * κατ' ἐπίκρισιν τῆς κυβερνήσεως μεταφρασθὲν μεθηρμοσμένον. ἐν Αἰγίνῃ, 1830; ὑπὸ I. P. Κοκκονη.

The method prescribed in this guide is the reciprocal or Lancasterian. It owes this second name to one of its inventors, Joseph Lancaster, of England (1778–1838). It has for its main feature the fact that the older pupils act as instructors for the younger. The Greeks took kindly to the system on account of its inexpensiveness. The first Greek to be attracted to the system in its Western form was G. Kleopoulos, who became acquainted with it while studying pedagogics in Switzerland. In 1820 he published a description of the system, recommending it to his countrymen. His brochure, Ἐκθεσις περὶ τῆς Ἀλληλοδιδακτικῆς Μεθόδου, appeared at Jassy in 1820. The method was at once introduced into the Greek schools of Jassy and Bucharest. (See Rangabe und Sanders Geschichte de Neugriechischen Litteratur, p. 25.)

About the same time Ath. Polites introduced it into the Ionian Islands, and Christophoros Perraebos established a school at Doli in the Peloponnesos.

This reciprocal method continues in use even yet in country schools; but the system is no longer in favor, and the teachers have found it best to assume to themselves all the obligations of directly imparting instruction to all their pupils, both beginners and more advanced.

SCHOOL IN THE OPEN AIR.

In many places the school buildings are inexcusably ill-looking. Often the school consists of a single small room, and sometimes it contains no teaching apparatus whatsoever. Few communities own school buildings, and it is not always the most commodious and pleasant quarters that the committee rents.

On this account, as well as on account of the love which the Greek has for the open air when the weather is fine, teachers in the smaller towns often hold school out of doors, under some large tree or in some other shady place. Mr. D. Kaprales, in his book Ἀνὰ τὰ Ὄρη (p. 74), describes such a school in a small village not far from Patras. "On account of the excessive heat, the village schoolmaster holds session under the shade of a plane tree. Thirty little lads, each with a sack full of booklets at his side, sit on long benches. They con in silence their lessons, accompanied by the sweet susurrus of the mountain breeze. * * * Some of them, as punishment for having been at fault the day before, kneel while listening to the master's teaching. While others failing in their recitations are soundly switched, the master accompanying his action with the adage 'the rod is a gift of God,' as though it were an incantation."

Sometimes the number of pupils in the small schoolrooms is much too large for the room, and accordingly it is certainly a relief both to teacher and to pupils to escape into the open air.

As an illustration of how many pupils are in some country schools, a school for the little girls in the village of Limne in Eubœa may be taken as an instance. Mr. G. Paraskevopoulos visited it in 1893, and mentions it in his Ταξεῖδι ἀνὰ τὴν Ἑλλάδα. He found that one woman teacher had 110 children under her charge. Had not the tidiness and cleanliness of the old schoolroom as well as the children immediately

impressed him, he would have expected to find but poor results. As it was, however, he was astonished at how the little girls could read. For lack of benches many of them had to sit on the floor.

The following table shows the matter taught in the demotic schools, and the number of hours per week devoted to each study, for each of the four years. (See *Στοιχειώδεις πρακτικαὶ ὁδηγίαι τῆς διδασκαλίας τῶν μαθημάτων ἐν τοῖς δημοτικοῖς σχολείοις ὑπὸ* Δ. Γ. *Πετρίδου. ἐν Ἀθήναις*, 1880; in the *Θεσμολόγιον*, p. 140.)

Matter taught.	Number of hours per week.			
	First year.	Second year.	Third year.	Fourth year.
Religious instruction (sacred history, catechism, reading of selections from Holy Scriptures)	3	3	3	
Greek (object lessons, reading, writing, grammar)	12	12	12	12
Arithmetic and geometric forms	5	5	5	5
Drawing	.....	.....	3	3
Simple natural history, taught chiefly under the heading of Greek in the object lessons and in the reading books.				
Geography	.....	.....	3	3
Greek history	.....	.....	2	3
Vocal music	2	.....	2	2
Gymnastics	.....	2	2	2
Total number of hours per week	22	22	32	33

EXPENSE OF SCHOOL BOOKS.

In all schools the pupils furnish their own books. These are not expensive. They are usually unbound, and cost from a few pennies to about 50 cents each. Yet many a parent finds it difficult to provide them. Accordingly in some places books are furnished free by some plan or other. Thus in the island of Pholegandros, where the people, although very simple, take a high interest in their schools—and they have both a demotic and a Hellenic—books are supplied to the children at the expense of the Pholegandrian Brotherhood, a society existing in Constantinopol and made up of Pholegandrians temporarily living in that city for the sake of employment. The sole object of the society almost is to foster education. Think of it. And all of its members are day laborers. They contribute to the maintaining and improving of the schools in their island home, from which they are separated for a time by self-imposed exile, keep the school buildings in repair, supply maps, teaching apparatus, and books, etc. (See *Φολέγανδρος, ὑπὸ Ζαφειρίου Γαβαλα* in the *Δελτ. τῆς Ἱστ. κ. Ἐθν. Ἑταιρ.* Vol. II, pp. 503–504.)

PRAYERS IN SCHOOL.

Each half-day's work in school begins and ends with prayer. The pupils all stand up and make the sign of the Cross three times. Then the teacher or one of the older pupils pronounces the prayers, which are always the same, namely, in the morning the *Βασιλεῦ Οὐράνιε* and *Κύριε τὸ πανάγιόν σου Πνεῦμα*, before the noon recess, the Our Father, the *τὴν πᾶσαν ἐλπίδα σου, δι' εὐχῶν*, and sometimes a hymn. In the afternoon the session is opened with the *Δόξα Σοι ὦ Θεὸς ἡμῶν δόξα σοι*, and the *Κύριε ὁ Θεὸς ἡμῶν τῆς ἀληθοῦς σοφίας*, and at the close of the day's studies they recite the *Δεῦτε προσκυνήσωμεν*, the *Εὐχαριστοῦμέν σοι Κύριε καὶ Θεέ* and sometimes they sing a hymn.

A, B, C SCHOOLS.

(Γραμματοσχολεῖα.)

In small hamlets where it is impossible to support a demotic school, and yet the place is too remote for the children to attend the nearest demotic school, it is permitted to establish a *γραμματοσχολεῖον* or A, B, C school. The teacher in a grammatoscholeion need have no special preparation for teaching. It is sufficient that he be

that had studied in the gymnasia, and an examining committee was appointed before which candidates for these positions of teachers might appear.

But in 1876 it was deemed expedient to re-establish the teachers' school. It began to operate September 24 of that year.

THE GYMNASIA.

(Τα Γυμνάσια.)

The first gymnasium in Greece was the "Central School," the Κεντρικὸν Σχολεῖον, founded in Ægina on the 13th of November, 1829. It was intended to be a model for all other gymnasia throughout the kingdom. The first years of the school, however, were not entirely successful. The discipline was monastically rigid. The teachers were under governmental surveillance. The freedom which successful teaching demands was wanting. These defects, however, passed away with Kapodistrias.

As with the Hellenic schools, so also with the gymnasia, their founders and organizers aimed at introducing a faithful copy of the German schools. The gymnasia were modeled especially after the gymnasia of Bavaria.

In 1837, when the university was opened, there were four gymnasia successfully operating. The number rapidly grew, and at present there is a gymnasium in every town of sufficient size to justify the Government in establishing it. In the larger cities, such as Athens, Patras, etc., there are more than one, according to the population.

Some gymnasia do not offer the complete course of four years, the two upper classes being wanting. These are called gymnasia of the second class. Those in which the full course is given are gymnasia of the first class.

Each gymnasium is managed by its own faculty. At the head of the faculty is the gymnasiarch, γυμνασιάρχης. The gymnasiarch is himself one of the teaching body of the gymnasium. However, he has the right and duty of overseeing the work of the other professors and of directing it in some measure.

The details in the teaching of the gymnasia are provided for by regulations of the department of education. There exists a general schedule or programme of studies which is to serve as a model for the yearly programmes of the individual schools. The department of education, from time to time as occasions call for such, publishes explanations or interpretations of such parts of the general programme as seem to need such additional illustration. A general programme was officially published as early as 1855. In 1867 a new programme was made and the old one annulled. Again, in 1884, a new programme was issued in June of that year. The programme of 1884 is still in force. These programmes determine the studies to be taught in the Hellenic schools as well as in the gymnasia. Although the gymnasia all follow the same general programme, and are from a material point of view provided for in about the same way, yet all do not produce equally good results. This is due to the accidental efficiency or inefficiency of the several teachers that make up the corps of instruction, to the quality and previous training of the students, their occupation, mode of life, etc.

The gymnasia are generally supported by the State; but in places where the population is not sufficiently large to justify the State in expending money for their support, the people of the community sometimes support one for themselves, paying the expenses in some ingenious way. For instance, the town of Nesion, in Messenia, not being favored by the Government with a gymnasium, its inhabitants were in the year 1896 supporting one by a voluntary tax, levied and collected by themselves of 1 centime (λεπτόν) on each oke of grapes or figs produced in their fields. (See Paraskevopoulos in his Ταξείδι.)

The physical sciences are taught, indeed, but in a very defective way. The gymnasia are classical schools, and the physical sciences are taught, not as having any prime importance, but as merely being worth some slight attention. This is, perhaps, due to the fact that the really great importance of classic education in Greece over-

shadows the high claims that the physical sciences have on modern education. The schools lack apparatus. Yet improvement should come, because these branches are now being taught by men that have won their doctorate in the physical sciences, and are therefore both capable teachers and interested in the progress of their specialty.

In the gymnasia of Athens, Patras, and other larger towns, the students wear a special dress or uniform of cadet-like appearance; in the smaller towns, however, no such luxury is to be seen. In these small towns many a young aspirant to letters still wears the national fustanella. It is a pity that all do not do so.

In order to seize the advantages of an education the hardy young Greeks, especially of the provinces, often endure hardships that would make us shiver. The writer once visited four brave lads that were staying in Sparta for the winter in order to attend the gymnasion there, as their own native *χωριό* had none. They had rented a small house consisting of one room with the ground for floor. He came in upon them as they were at dinner. The only food they had was a pot of maccaroni, cooked by themselves. Other than the four young heroes the only bright thing in that room was the little stack of books they took bashful pride in showing to him.

In the gymnasial course the study of philosophy is prominently included. The course includes logic, anthropology, psychology, and ethics. But these studies seem to be somewhat superficially taught. At least this is the opinion of Mr. I. Argyriades, who, in a report to the ministry of education (*Ἔκθεσις πρὸς τὸ Ὑπουργεῖον τῆς Παιδείας περὶ τῶν ἐν Ἀθήναις Γυμνασίων καὶ Ἑλληνικῶν Σχολείων*, p. 26), vigorously attacks the defects in the way in which philosophy is taught, and his complaints are warmly supported by Pantazides in his Pedagogics (*Παιδαγωγική*, pp. 31, 32.)

Since Greek is the vernacular language, it naturally holds a most prominent place in the curricula of the gymnasia. The young student comes to the gymnasium able to read and understand the simpler writings of his classic forefathers, such as the Dialogues of the Dead, or the Anabasis, or the more simple dialogues of Platon. He has mastered all of the Attic grammar save syntax, and he has spent at least a year at that, for he began it in the third year of the hellenikon. He is also able to write simple themes in the ancient language, and is able to paraphrase with wonderful mechanical accuracy from the ancient into the katharevousa. True, he has not had the gigantic difficulties to overcome that are sufficient to hinder youths of other countries from mastering ancient Greek. For him it is merely the learning of a different variety of his own vernacular. The intelligent young Greek is never at a loss to understand good Hellenic, although he may be amused by it. However, if in one lesson the teacher employs what he thinks to be a specially Attic word or phrase he is not surprised if his pupils use it back at him in the next lesson.

In the gymnasion the student reads not only the more difficult prose authors, such as Herodotos and Thukydides, but also the poets. He reads, and, from a grammatical standpoint, analyzes into shreds select dramas of Sophokles and Euripides. He reads the language of the poets not by quantity, as we say, but by accent—that is, he pronounces the words as he does when reading prose. He learns to scan also, but neither his teacher nor he have any liking for the process. His knowledge of prosody does not lead him beyond the ability to scan a dactylic or an iambic line.

The young boys enter the gymnasion with little preparation in Latin. On account of the greater importance of the classic Greek the Latin is liable to be slighted. At least to us in the west who regard Latin as equal in importance with Greek, it seems that Latin is underrated in the Greek gymnasia. (See Die Stellung des Latein in den Höhern Schulen Neugriechenlands. In the Berliner Philologische Wochenschrift, 1884 S., 31-32.) But after all we are liable to be prejudiced critics on the one side, as the Greeks themselves are likely prejudiced on the other side.

With a six months' training in Latin in the hellenikon, he comes to the gymnasion and takes up the following courses:

First year: Latin accidents, a Latin reader, Nepos.

Second year: Syntax, Cæsar.

Third year; Syntax, composition, Livy, Cæsar.

Fourth year: Composition, Vergil, Horace, and something in prose; e. g., pro Milone or the Agricola of Tacitus.

Of the modern languages, French is the only one that is obligatory in the gymnasion. Among educators are to be found some that desire to have German placed among the obligatory studies. But they have not been strong enough to succeed. German, indeed, is taught as an optional course. In some of the larger gymnasia English is also taught as an optional study. Although a four years' course in French is provided for, yet it is not seriously studied. Few of the students at the end of the four years are able to more than simply read it, and that faultily, notwithstanding the fact that the Greeks learn languages with great ease.

Mathematics are always taught by specialists. Accordingly, the instruction given is good. Yet the course is very weak. In pure mathematics the highest studies are algebra, geometry, and trigonometry.

In the university there is no chair of geography; so it is to be expected that this study in the gymnasia is not a success. Being taught by teachers who themselves have not studied it, no scientific enthusiasm either on part of teacher or student can be expected. Another difficulty in geography comes from the Greek language. The modern Greek is poor in sounds. It is not easy to transliterate into Greek the names of places, etc., met with in the study of geography. There is ever present the difficulty of putting such names as London, Massachusetts, Maryland, into intelligible forms with Greek letters. As yet there is no fixed practice. But such names as Rome, Switzerland, France, are represented by their ancient forms, Ρώμη, Ἑλβετία, Γαλλία. A few names are translated, as Τὰ Λευκὰ Ὄρη, Αἱ Ἡνωμέναι Πολιτεῖαι for "the White Mountains," "the United States." Other names again are either spelled in Latin letters and pronounced as the names are pronounced in their native country, or are transferred into Greekish form, as Ἀλιφάξη, Μιλβόκη, for Halifax, Milwaukee. (See Γεωγραφία Φυσική καὶ Πολιτική, ὑπὸ Μαργαρίτου Γ. Δήμιτσα. ἐν Ἀθήναις.)

Another drawback in the teaching of geography is the lack of apparatus. Until of late even wall maps of Greece itself with the names of the places in Greek were not to be found in the schools. Now, however, thanks to the efforts of the Society for the Diffusion of Greek Letters (Ἑταιρεία πρὸς Διάδοσιν τῶν Ἑλληνικῶν Γραμμάτων) and to the generosity of a rich Greek, Mr. Zapheiropoulos, simple geographical apparatus is not such a rarity as it was some years ago. The society has taken steps to fit out the schools with useful apparatus for different branches, and Mr. Zapheiropoulus has borne the expense of publishing a number of excellent maps.

History is taught during all of the four years according to the following schedule:

First year: Greek history from its beginnings down to the time of Alexander, preceded by an introduction, treating of the different peoples of the East with whom the early Greeks came into contact.

Second year: Roman and Byzantine history down to the capture of Constantinopol by the Franks in 1204.

Third year: History of the Middle Ages, and modern history down to the treaty of Vienna.

Fourth year: Greek history down to the appointment of Kapodistrias as governor of Greece.

Of the natural sciences several are taught, but the time devoted to each is necessarily short. Still it is better, perhaps, to give a certain general knowledge of the principles of a number of these sciences than to devote all the disposable time to one or two exclusively. Whoever wishes to pursue any one of them as a specialty will find his opportunity in the university or in the Polytechnic Institute.

The general programme of 1884 orders a course of natural sciences as follows:

First year: Zoology, two hours a week.

Second year: Botany, geology, mineralogy, two hours a week.

Third year: Experimental physics, two hours a week.

Fourth year: Chemistry and cosmography, two hours a week.

THE SCHOLASTIC YEAR.

In the gymnasia the school year begins with the first week of September, and continues, with a short break at Christmas and a week at Easter, until the end of July. But the entire month of September is consumed in examining new applicants for admission, and the entire last month is occupied with the annual and final examinations. Accordingly there are but nine months of regular instruction, and even of these nine months the last one is given over to repetitions, etc., in preparation for the examinations, and is therefore almost lost so far as education is concerned. There remains then but eight months of real instructive teaching.

EXAMINATIONS.

In the gymnasia the following examinations take place:

In the month of September there are examinations for such new applicants as have no regular dimissorial (*απολυτήριον*) or certificate stating that they have finished a course in the hellenikon; also examinations for all who having failed at the examinations for promotion in the preceding July were accorded the privilege of presenting themselves again in September.

In January written examinations are held in all branches.

In July the regular annual oral examinations are held in order to discover who are worthy of promotion and who are not. No promotions are made in midyear. It is wrong to allow promotion to depend, not on the work of the year but on the annual examinations; but the Greeks are not the only ones that make this mistake. At the end of the year also are held the examinations of those that have finished their gymnasial studies and wish to procure a dimissorial (*απολυτήριον*) or certificate for the university. These dimissorial examinations do not cover the matter of four years of the gymnasion course, but merely the matter of the last year.

DISCIPLINE—MODES OF PUNISHMENT.

What we said of the pupils of the lower schools, that they are diligent and well behaved, can also be said of the average student of the gymnasion, though not with the same emphasis.

The punishment with the rod, although a favorite one with the Greek schoolmaster, is forbidden by positive orders of the ministry of education, under date of December 12, 1848. In spite of this law, however, the teachers in the lower schools still use the rod, but the teachers in the gymnasia have long since discarded it.

Expulsion (*αποβολή*) from the gymnasion is inflicted when milder remedies fail. According to the law, sentence of expulsion can be passed on a student only by vote of a majority of the professors in the school. This decision of the corps of teachers can not be revoked even by the minister of education.

When a student is found guilty of some greater crime, he may not only be expelled from his own gymnasion, but also be punished by "exclusion," *αποκλεισμός*, from all other gymnasia of the kingdom. This punishment can be inflicted only by the cooperation of the professors and the local representative of the civil government. The student thus punished can appeal to the minister of education against the sentence.

SCHOOLS FOR GIRLS.

The Greeks have not been so prompt in caring for the intellectual training of their daughters as for that of their sons; yet they have never looked on education as unbecoming or even useless to a woman. We have already seen that in the year 1824, almost immediately after the battles of Marathon and Kalamos, which brought the first fresh breath of freedom to the Athenians, a school for girls was opened in the Parthenon.

Years passed, however, before the Greeks could provide any public system of education for girls higher than what they could learn in the demotic schools.

The first school in which girls could receive more than the mere elements of learning was established in Athens by two Americans, Dr. and Mrs. Hill.

But the Arsakeion (Τὸ *Αρσάκειον*), which is now perhaps the best school for young ladies, can also boast of quite an early origin. It was founded in July, 1836. It takes its name from its greatest benefactor, Apostolos Arsakes. This same munificent patriot has also founded similar schools elsewhere.

The Arsakeion in Athens, and a number of similar young ladies' schools, *παρθεναγωγεῖα*, in other cities of Greece, were the result of the endeavors of a number of men, who associated themselves together under the name of the Society of the Promoters of Education, *Φιλεκπαιδευτικὴ Ἑταιρεία*.

These determined men began without means. They sent out appeals to various rich Greeks, and Arsakes responded.

The course of studies in the Arsakeion is on a par with that of the gymnasia for boys,[1] and graduates of this school now have the privilege of becoming university students.

The Arsakeion does good especially by preparing teachers for the elementary schools for girls.

PRIVATE SCHOOLS FOR GIRLS.

Such parents as can afford it have a strong inclination to send their children not to the public schools, but to schools in which the pupils receive more parental care than can be given to them in the public institutions. There are accordingly many such private schools of all grades, whether for boys or for girls, throughout all of Greece. As a sample of a parthenagogeion, or young ladies' school under private management, we take one in Athens under the direction of Miss Aspasia Blasiou Skordele. (See *Κανονισμὸς τοῦ Ἑλληνικοῦ Παρθεναγωγείου Σοφίας Σιμοπούλου καὶ Ασπασίας Βλ. Σκορδέλη ἐν Ἀθήναις*, 1891.)

This educated and refined lady takes her love of the art and practice of teaching from her father, Blasios Skordeles, who has made a study of education all his life, is most thoroughly acquainted with the condition of primary and middle education in Greece, and has written valuable works for the use of teachers and scholars.

Lady Skordele studied in the Arsakeion. Her teacher in pedagogics there was her own very competent father.

Ten years ago this academy was founded. It contains three separate departments, a kindergarten, a demotic school, and a high school, which includes the classes of a Hellenic school and the two lower classes of a gymnasion. There is also an extra course of two years more for such as are preparing themselves for teaching.

Lady Skordele does not object to the principle of women pursuing higher studies and devoting themselves to special sciences, but yet thinks that Greece has at present more need of competent housekeepers and intelligent wives and mothers than of scientific women. For this reason this school does not profess to prepare young ladies for the university.

The kindergarten is intended for children of from 4 to 6 years of age. The system followed is the Froebelian.

The course given in the demotic school extends over the regular four years. The matter taught during this period is as follows:

Religion, portions of the Old and New Testament; modern Greek language; reading, grammar, declamation; learning by memory of select pieces in prose and verse; composition; arithmetic, applied to problems taken from such experience as children have; leading events in national history, taught mostly by biographers; description of Greece, together with general geography and map drawing; simple lessons in the natural sciences and in art; French, compulsory; drawing, caligraphy, hand work, vocal music, gymnastics.

---

[1] See course of studies in the *Ὀργανισμὸς τοῦ Αρσακείου Παρθεναγωγείου*.

The course in the high school extends over six years. It embraces catechism, explanation of the ceremonies of the church, principal events in church history; ancient Greek, with grammar, including syntax, composition in modern Greek; Greek history, Roman history, portions of universal history; geography and cosmography; arithmetic and the elements of geometry; elements of natural history, anthropology, experimental physics, and chemistry; elementary knowledge of Greek art and literature; domestic economy, domestic pedagogy, and the elements of hygiene; French and conversation in French, German and English optional; sketching, vocal music, gymnastics, hand work, cutting and sewing, painting, molding in clay; piano and dancing are optional and at extra charges.

Pupils may attend as interns (*τρόφιμοι*), or as half boarders (*ἡμιτρόφιμοι*), or as day scholars (*ἐξωτερικαί*).

Tuition for interns is 1,400 drachmas a year; for half boarders, 20 drachmas a month in addition to what they would pay as day scholars, and for day scholars the tuition varies from 7 to 35 drachmas a month, according to the class the pupil is enrolled in.

The half boarders take dinner in the school. The number of pupils is from 200 to 240 each year.

Last year, 1896-97, the teaching body consisted of twelve women teachers and ten men professors. The professors teach such branches as the women teachers are not prepared to teach.

THE UNIVERSITY.[1]

(Τὸ Πανεπιστήμιον.)

Since the sixth century, when Justinian closed the philosophical schools of Athens, down to the nineteenth there was little of higher education in Athens. The city of the goddess of wisdom, where once triumphed art and letters and science, had become so insignificant that scholars of the West did not any longer know whether it yet existed. Martin Kraus asks this very question. Although recent archæological and historical investigation shows that Athens never ceased to exist, and that it was throughout all the middle ages an important if not a prominent city of the Byzantine Empire, yet it is true that Athens of those days had fallen, fallen. At the most it produced a scholar of repute now and then, such as the brilliant Evdoxia, who later became Empress. But there were no important institutions of learning nor any great teachers. The monastic schools, founded to replace the schools of philosophy, did good work in their way, but their aim was not high.

It was only after the return of liberty to Athens that a higher school of learning was again established. No sooner had the Greeks loosed themselves from the bonds of oppression than their old love of learning immediately reasserted itself.

We have seen how the English wisely founded a college at Kerkyra, and how well it prospered. This school probably served as an incentive and a near model for the Greeks of the mainland.

The years of Kapodistrias's dictatorship passed away without the founding of a university.

In 1834 the seat of government was transferred from Navplion to Athens. The transfer was made under Otho, who, after the death of Kapodistria, was appointed by the powers to be the first King of regenerated Greece.

On the 31st of December, 1836, a royal decree was issued providing for the establishing of a university, and regulating the details concerning the constitution of this future institution. This edict was promulgated during the absence of the King in Europe. The King, on returning, was not pleased with it, and in a decree of April 14 (26), 1837, he declared the previous decree null, and issued a temporary set of regulations for the proposed university. Then, on the 22d (3d) of April he issued a decree for its final establishment. This decree contains the names of the men appointed to be the first professors. It is published in Bambas (*Νόμοι τοῦ Πανεπιστημίου*, pp. 61–70). Otho followed the custom prevalent in Germany, and named the university after himself, *τὸ Πανεπιστήμιον τοῦ Ὄθωνος*.

A full system of schools from the lowest to the highest had been drawn up by Maurer, one of the regents during the minority of the King. (See Maurer, Das griechische Volk, etc., II, pp. 188, and 215.) He proposed to have a Hellenic school in every eparchy, and in every province a gymnasion, and in Athens a university, an academy, and a school of art. His plan was to have the founding of the university take place in October, 1834, and that of the academy on November 2, his own birthday. But he had been recalled to Germany before having an opportunity of putting his plans into act. He brought them with him to Germany, not wishing others to idly profit by them, nor his reputation to be jeopardized by their misuse or misinterpretation.

Otho's decree was welcomed with joy. Only one determined voice was raised against it, the editor Lebides, in his journal, the *Ἐλπίς*, fiercely attacked the founding of the university as premature.

But what name was to be consecrated to serve as a translation for the European word "university?" The institution founded in Kerkyra by the English bore the title of "academy." But the word *Ακαδήμεια* in its classical sense expressed something different from a university, and besides the modern Greeks wished to use that word as a translation of the European word academy. Names such as *Μουσεῖον*, *Πανδιδακτήριον* were recalled. Other names that in Turkish times indicated a school of higher studies were *Ἑλληνομουσεῖον*, *Λύκειον*, *Φροντιστήριον*, *Γυμνάσιον*. These names though adaptable gave way finally to the new creation, *Πανεπιστήμιον*. It certainly is a suitable word, expressing at least all that is implied in the "Universitas Literarum et Scientiarum" of the West.

The decree of 1837 contained a number of regulations which were to serve as a guide in all matters relating to the university until such time as a regular constitution could be drawn up. This constitution, however, never came into existence; and the provisional regulations of the decree have served ever since as the basis of all university government.

According to these regulations the university consists of four faculties, theology, law, medicine, and philosophy. Each faculty or school, consists of a definite number of chairs or professorships. The professors of each school under the presidency of the dean, constitute an independent teaching body, inseparable, however, from the university, and in continual touch with the other schools, and under the general control of the senate of the university.

The provisional regulations provided that the first professors should be appointed by royal decree, but that beginning with the year 1842 the several schools should elect their own professors. The mode of election was to be determined in the university constitution; but, since that constitution never came into existence, the Government continued to appoint directly all professors up to the year 1882. Since that year each school proposes the candidates and the minister of education formally appoints.

The King appointed twenty-three professors, two in the school of theology and seven in each of the other schools. It is easy to believe that Otho had a difficult task in finding twenty-three men capable of undertaking university work. True it is that he could find many that were willing to undertake the task, but yet there were scholars in Greece that loved duty more than dignity. One of these was Gennadios. Otho invited him to a chair in the university. Gennadios replied: "If we all make a jump for the university who will take care of the lower schools? They also are important." Scholars were not scarce in Greece at that time, but other requirements beside scholarship are needed in a professor. To prevent all devastating blunders he should have already been tried as a teacher in a lower school and found capable. Several of the first professors were Germans. That it should have been found wise to appoint these foreigners should not surprise us. They were men of experience. It is in no way a reflection on Greece. The Greeks should be proud to have been able to produce instanter an Asopios, a Leon Melas, a Misael Apostolides, an Argyropoulos, a Pallekas, a Kostes, a Kontogones. Among the German professors were Feder in the school of law, Treiber in medicine, Ulrichs in Latin, Ross in archæology, and Landerer in chemistry.

Ludwig Ross was a native of Denmark. He was also appointed custodian of antiquities. In this capacity, as in that of professor, he did much good. He undertook, however, to restore the Parthenon to its original condition. Archæologists and art lovers are glad that he did not have an opportunity of carrying out this attempt. He collected many inscriptions and other remains of antiquity that otherwise would have been lost. His descriptions of his journeys through different parts of the Kingdom are especially interesting, and useful as funds of historical, philological, geographical, and archæological information.

Ulrichs was a native of Bremen. He died in Athens in 1843. Before receiving the appointment to a professorship in the university he was professor of Latin in the central gymnasion in Ægina. He came to Athens not as seeking a position, but as a Philhellene.

These Germans adopted the modern pronunciation of Greek, and then, speaking in ancient or modern language, they were at once intelligible to their foreign audience.

The first four deans, then called Σχολάρχαι, but now Κοσμήτορες, were appointed, as were the professors, by royal decree. Now, however, each school elects its dean.

The first rector, Πρύτανις, was also appointed by royal decree. This honor was given to Konstantinos Schinas.

On the 3d (15th) of May, 1837, the official opening of the new university took place in the presence of Otho and his cabinet. The scene was so affecting that the King wept. The Bishop of Attika blessed the undertaking and chanted the Εὐλόγητος εἰ χριστέ. The Prytanis read an address proper to the occasion, as did each of the four deans. The first regular lecture took place in the following week, on the 22d of May. It was a lecture by Ludwig Ross, and on the Acharnians of Aristophanes.

But where did all of this take place? No buildings had been erected to serve especially for the purposes of a university; and no large buildings already existed; in fact, oppression and war had reduced Athens to a mere collection of hovels. One building, however, was found sufficiently commodious for the immediate needs of the infant university, the house of Kleanthes, Οἰκία Κλεάνθους. This had already

been used as a gymnasion. It stood near the foot of the north slope of the Akropolis, in the "Plaka," or, more exactly, in the Anaphiotika, a section so called because inhabited by settlers from the island of Anaphe. The house is still standing, although few seem to know its fame. It is now monastic property, being a possession of the Church of the Holy Sepulcher, in Jerusalem (*Μετόχιον τοῦ Ἁγίου Τάφου*). (See *Ἑσπερος*, VII, 24.) The Archæological Society is now preparing to excavate the Anaphiotika quarter, and an old landmark will soon be destroyed.

THE FIRST STUDENTS.

When the university was founded, there were only three gymnasia in the entire Kingdom having the right to give dimissorials, and these had been in existence but a few years. Accordingly, there was not a large number of young men that could present themselves as trained candidates for a university course of studies. The three gymnasia then operating were those of Navplion, Syros, and Athens. The one at Ægina had been discontinued, and its personnel and movable property transferred to the gymnasion of Athens.

It was discovered that the number of regular students at the university would not be sufficient to enable the professors to teach their course in a satisfactory way. In order not to be impeded by this circumstance, two measures were resorted to. First, not only might all young men that had completed the course of studies in a gymnasion become full students, *Φοιτηταί*, in the university, but also all the pupils of the highest class in the gymnasia were allowed to enroll themselves as full students without making their last year of the gymnasion course. Secondly, any person in a Government position, or any other person of good repute and some preparation, could be enrolled as auditor (*Τακτικοὶ ἀκροαταί*). This class of regularly enrolled auditors was recognized until 1844, when, on account of the sufficiently large number of regular students, there no longer existed any need of the auditors. But attendance at the lectures of the university has never been denied to anyone; so that the number of auditors has always been considerable, although not recognized officially.

No one not a regular student could become a candidate for a degree. The regular auditors might receive testimonials stating what courses they followed as auditors.

By the two concessions mentioned the university succeeded in gathering in 127 men and boys, of which 52 were full students and 75 regular auditors. Of these there were in theology 8 full students, in law 22 students and 71 auditors, in medicine 4 students and 2 auditors, and in philosophy 18 students and 2 auditors.

STUDENTS FROM UNREDEEMED GREECE.

But there was another difficulty to be met. Since the university was intended not only for the sons of inhabitants of free Greece, but for young men from all parts of the Greek world, some provision had to be made for the admission of students coming from abroad—from Turkey in Europe, from Asia Minor, from Egypt, etc. These applicants could not bring a dimissorial from a gymnasion, because gymnasia did not exist in most of the cities of these countries. Yet they were often quite well prepared to begin a university course, having studied in some good Hellenic school of the old type or having received private instruction. To do justice to these candidates a special committee of professors was appointed to examine them, and if found fit they were allowed to be enrolled as full students. This committee continued to exist until regular gymnasia had been established in most of the large Hellenic centers abroad, and the young Greeks from outside the Kingdom could come with a regular dimissorial. The provisional government, which held sway for a time after the overthrow of Otho, abolished the committee by a decree of September 6, 1863 (see Bambas, p. 46, note), and since 1863 if a student comes from without the Kingdom, not having a dimissorial, he is advised to present himself at a gymnasion and pass the final gymnasial examination, and thus receive the regular certificate of admission to the university.

The sons of the unredeemed Greeks have shown themselves worthy of the concessions made to them. They appreciate the blessings of education even more than do those raised in the Kingdom of Greece. You can perhaps find no Greek village in all the country under the Crescent, be it in Europe or in Asia or in Africa, without finding the poor rajah saving up his groats in order to send a son to Athens to study.

THE SECOND YEAR.

Shortly after the formal opening the lectures were discontinued on account of the approach of summer. In the following September they were resumed, and thus the university entered upon its first full year of duty. For this year a programme of studies was issued according to the German system, with a learned archæological monograph by Professor Ross. To the school programme of the following year a like dissertation was prefixed on a theological subject. Thereafter, however, the custom of prefixing such dissertations was abandoned.

During this year a second class of instructors was added, corresponding to privat docenten in the German universities. These *ἐφηγηταί*, as they are called, teach as independently as do the full professors, only they must find hours not occupied by a professor's work for the same students. These docents receive no salary.

THE FIRST DOCTOR.

Although university work went on regularly and earnestly, seven years elapsed before a candidate came forward to take the examinations for the doctorate. This lack of candidates was due to two causes, to the fact that the Government had not yet determined on the conditions for the doctorate, and that the better students were glad of an opportunity to go to Europe for a year or two to finish, while the less ambitious were satisfied with a mere certificate of the fact that they had made a university course.

The Government first published the conditions for examination for the doctorate and the method of conducting the examinations in a decree of May 19 (31), 1842.

When in the year 1844 a candidate presented himself for examinations the event was an interesting one. The candidate was Anastasios Goudas, from Ioannina, one of the students that matriculated for the first opening of the university. He received his degree in medicine. In the same year Konstantinos Kleonthes presented himself in the school of philosophy. Although a good student he failed in the oral examinations. Accordingly he left the university with no other title than that of *τελειοδίδακτος*, which meant that he had followed a full course. He afterwards became a teacher, and a successful one. Shortly before his death, which happened a few years ago, he finished and published in Triest an edition of Pindar in five volumes.

The new university, as can be clearly seen, was modeled after the German schools, and more especially after the universities of North Germany, on a plan originally drawn up by Professor Brandis. Whether so close an imitation was wise or not is difficult to know. It is certainly wiser to imitate than to differ merely in order not to imitate.

GREEK AND GERMAN PROFESSORS.

There soon rose sharp friction between the Germans and the Greek professors. The result was that in 1843 Ross and Ulrichs lost their professorships. This was due, not so much merely to lack of harmony between the two sets of professors, as between the Greeks and Germans in general. In fact, a revolution broke out in Athens which had as its result the expulsion of all Germans from positions under the Greek Government.

THE UNIVERSITY AND THE BOULÉ.

On account of the high hopes the Greeks held for their university, and the influence they expected it to have for good in the advancement of the interests of the

race. it seemed not improper that the university should have its representative in the Parliament or Boulé.

When in September, 1843, the dissatisfaction of the people with the dictatorial policy of good King Otho and the unsavory possession of all higher positions by Bavarian officeholders, caused an insurrection of the army, the sympathies of the university men were on the side of the people, although the professors were not forward in promulgating their democratic views. However, after the insurrection was an accomplished fact, and its results had been accepted by both King and people, they did not hesitate to refer to it approvingly even on official occasions.

A result of this insurrection was that Otho conceded a constitution to the nation. A National Assembly, Ἐθνικὴ Συνέλευσις, was convened to vote on the acceptability of the constitution. The professors petitioned the assembly for a representative in the Boulé. Objection was made against the petition on the grounds that if such a privilege were conceded to the university, then also other corporations would demand the same right. Finally, however, by a vote of 119 to 44, the privilege was granted. The representative might be himself one of the personnel of the university, or he might be an outsider.

The university accepted the coveted privilege and elected Alexandros Mavrokordatos. He was a prominent politician. The appointment was not by any means pleasing to the Boulé, and it refused to recognize the appointment.

In the following year the excellent professor of philosophy, Philippos Ioannou, was sent as representative, and was accepted. On the 5th of February, 1846, in a splendid oration before the Boulé, he defended and vindicated the action of the university in electing Mavrokordatos. (See the Αὐγὴ for February 7, 1846.)

In the next National Assembly, which was convened in 1862 to heal the wounds made by the expulsion of Otho, the university was represented by two delegates. Their presence and right to be present was recognized by the Assembly, but it passed a decree depriving the university of all future representation in the Boulé.

NAME OF UNIVERSITY CHANGED.

The university continued to bear the name of its founder, Otho, as long as he continued to be King of the Greeks. But when in 1862, this Philhellene retired, the Greeks, prompted by their eternal spirit of democracy, changed the name of the university from Ὀθώνειον to Ἐθνικὸν Πανεπιστήμιον, National University. The change was proposed by the minister of public instruction, and the Provisional Government, which then controlled affairs, immediately sanctioned the change on the 29th of October, 1862. Indeed the university, especially the students, was responsible in a great measure for the insurrection. With this change of name, and the part the university took in the insurrection, we are forced to recall the prophetic words of the old soldier, Kolokotrones, who on one occasion, pointing to the new building of the university and to the colossal marble palace of the King, which stands but a few squares distant, said: "This house will some day eat that house up," Τοῦτο τὸ σπίτι θὰ φάγῃ ἐκεῖνο τὸ σπίτι. (See Ἐθνὸς, October 17, 1887.)

The name of national was chosen because the Greeks regard the university not as the university of Athens, or of the free kingdom merely, but of all the Greeks.

THE FIFTIETH ANNIVERSARY OF ITS FOUNDATION.

In May, 1887, the university celebrated the fiftieth anniversary of its foundation. Great was the pride of the Greeks over all the Eastern world. Telegrams and letters of congratulation and embassies came from all quarters. The feast of intellect lasted for three days. It began with religious services in the Metropolitan Church on the morning of May 17th, and ended with the presentation of a Greek drama, Sophokles' Œdipous, the King.

In memory of this significant event the council of the university resolved that a chronicle be written giving the history of the first fifty years' progress of the university. The honor of writing it was conferred on Prof. Ioannes Pantazides. He published the chronicle in 1889.

A FEW OF THE MORE PROMINENT PROFESSORS.

Many of the professors have been men of high attainments in their special line of investigation. The name of Asopios can not be omitted. Asopios had studied in Germany and taught in the Ionian Academy.[1] He was an enthusiastic admirer of the old philology. He wrote a grammar which served as a model for most of those that have since been written in Greek. In 1842, by royal decree, a seminary for the study of the Greek language was established in the university, and Asopios was appointed to be the first director.

A professor remarkable for the influence which he possessed over the students was Theodoros Aphentoules. (See sketch of his life in the *Ποικίλη Στοά* for 1894 by Dr. Petros Apostolides.) For fifty years he taught pharmacology in the university. As teacher he was as interesting as he was scientific. It was not rare for students of other specialties to attend his lectures regularly on account of the attractiveness of his teaching. He has added to modern Greek literature not only noteworthy treatises in his own science, but he was a lover of fine literature as well, and has left a volume of beautiful lyrics.

He lived not in Athens, but in the Peireevs. There also he practiced as a regular physician. The entire city knew him, and knew him as a benefactor. He was often in serious humor called the tutelary deity of the city, *Πολιοῦχος τοῦ Πειραιῶς*. He died a few years ago.

The school of theology has not produced any great scholars, but it has produced some remarkable men. One of the first professors was Kontogones, who taught from 1837 up to the year of his death, in 1878. (See his life, by Pavlos Ioannou, in the *Εσπερος*, III, 135.) Besides teaching continuously, and sometimes supplying for long periods of time other professorships for which there was no incumbent, he wrote a number of books that mark an epoch in the work of the school. Among these works are his *Ἐπιτομὴ Ἑβραικῆς Ἀρχαιολογίας*, his *Πατρολογία ἤτοι ἱστορία τῶν πατέρων τῆς ἐκκλησίας τῶν πρώτων αἰώνων*, an *Ἑλληνικὴ Μυθολογία*, an *Ἐπίτομος εἰσαγωγὴ εἰς τὰς Γραφάς*, and *Ἐκκλησιαστικῆς Ἱστορίας τόμος πρῶτος* (his death prevented the completion of this latter work). He also edited for a number of years the *Εὐαγγελικὸς Κήρυξ*, an ecclesiastical and theological periodical which enjoyed high reputation even outside of Greece.

Speaking of eminent professors, it will not be out of place to mention two or three of those who are still living.

In the school of philosophy, Konstantinos Kontos, whose compeers in his specialty are few, teaches the Attic language. Among his best known writings are his *Γλωσσικαὶ Παρατηρήσεις*, in which he sharply corrects many blunders made by modern students of the Attic, both Greek and foreign.

Another philologian of highest worth is Georgios N. Hatzidakis, whose specialty is comparative philology as applied to the study of the Greek language, both ancient and modern. His writings in Greek and in German are numerous. His largest work is his Grammatik der Neugriechischen Sprache (Leipzig, 1892).

Prof. Stephanos Koumanoudes must also be mentioned. On account of advanced age, he is no longer in active service. His services to philology and archæology are known the world over. He was for years one of the editors of the *Ἐφημερὶς Ἀρχαιολογικὴ* and of the *Ἀθήναιον*. Among his important books is his *Λεξικὸν Ἀθησαυρίστων λέξεων*.

The schools of law and medicine have also produced a number of scientific men.

The professors of the university are nearly all of the orthodox religion. But there is no religious test whatsoever. Two of the professors are Catholics, and one of the docents is a Protestant, a former student of Harvard.

[1] See Const. Asopios, by Frabasiles, in the Rassegna Ellenica, No. 5.

DOCENTS.

Whoever wishes to become a docent, *ὑφηγητής*, brings to the dean of the school in which he desires a place his doctor's diploma, a statement concerning the matter he intends to teach, and a habilitations dissertation on the same subject. The dean lays these before the faculty of the school. The faculty appoints a day for him to appear before them and lecture. If he shows himself a fit teacher, he is approved and recommended to the minister of education for appointment. If the candidate shows himself capable, the school can not refuse to appoint the day for his trial lecture, and can not refuse to declare his fitness. His appointment therefore depends almost entirely on his own worthiness.

In the school of theology, since the doctorate is not regularly conferred, candidates for the *ὑφηγεσία* may present a diploma from the school of philosophy, together with a statement that they have heard a course in theology. If they have studied abroad, they may, of course, present their diploma from a foreign university. (See Bambas, *Νόμοι*, pp. 44, 45.)

GOVERNMENT OF THE UNIVERSITY.

The highest governing power in the university is the senate, *Σύγκλητος*. The senate is made up of one dean and one other representative elected by vote from each of the four faculties, the rector, who is elected annually by the full body of professors, and the proprytanis, or rector of the preceding year. These ten men then constitute the senate. They are amenable to the minister of education. The prytanis and deans hold office for one year; the other representatives for two years, two being elected each year.

BENEFACTORS.

The little Kingdom would not have been able to do so much for education were it not for the efficient aid of generous and patriotic individuals. The university, as the crowning institution in Greek education, has merited and received gifts, not only from Greeks, but also from Philhellenes. The Greeks, in giving of their wealth to the support of the university, never lose thought of the national idea, and accordingly, moved by patriotism, their gifts are sometimes valuable, not for the amount given, but for the spirit of the donor. However, many a gift comes sufficiently large to be of grand service to the cause of higher education. A list of all gifts of sufficient size to entitle the giver to the rank of benefactor of the university was published complete up to the year 1872 by Rector Kastorches in his report for that year. The gifts since that date are mentioned in the yearly reports of the successive rectors.

One of the most munificent donors was the Kretan Ph. Papadakis. He left the greater part of his fortune to the university. His gift netted 893,168 drachmas.[1] As a condition, Papadakis imposed the obligation of keeping three scholars, giving each 100 drachmas a month. His country does not forget him. The grave of Papadakis, in the cemetery beyond the Ilissos, is adorned by a beautiful monument, made by the sculptor Broutos, representing Fame writing the name of Papadakis on a slab over his grave. On the gravestone is the following inscription:

Δωρεᾷ ὃς πίνυτε περισσῇ ἐπαί ἐ λίπ' αἰών
Μουσάων ναὸν Ἱερίδων ὕπατον
Τῷ κείνου ταμίαι τὸδ' ἄγαλμ' ἐπὶ τύμβῳ ἔθηκαν
Μνῆμ' εὐεργεσίης ἔμμεναι ἀθάνατον.

(See *Ἑσπερος* August 15, 1881.)

Other large donors are Bernardakes, Batopedinos, and the Ionides family.

Another kind of benefactor is represented by Barnabas, the Kretan, who, having no money to give to the university, and yet desirous of doing what lay in his power,

[1] A drachma is worth about 19.3 cents.

gave his pistols and yataghan to the astonished rector, Dr. Soutsos. (See *Λογοδοσία Σούτσου*, p. 25.)

On another occasion the university fell heir to 20 drachmas, bequeathed to it in the will of Demetrios Oka, knife grinder.

The names of the more munificent donors are written in letters of gold on two marble columns that stand on either side of the entrance to the aula magna of the university; and on the 30th of January of each year, the feast of the three great Hierarchs, the university celebrates solemn mass for all these benefactors, praying for the health and long life of the living and the repose of the soul of the departed. On this occasion a panegyric in their honor is spoken by one of the professors. This *Μνημόσυνον* was first celebrated in 1842, when Professor Bambas spoke the panegyric. The feast of the three Hierarchs had long been a school feast among the Greeks.

The university, although the recipient of many and generous gifts, did not and does not preclude other institutions from receiving other equally generous gifts. Thus, Prince Ypsilantis gave his whole fortune to found a school in Navplion. The school still flourishes there. Others, like Arsakes, Barbakes, Rizares, etc., gave their good gifts elsewhere. These benefactors began their givings long before the establishment of the independent kingdom, as we have already seen in speaking of schools in Turkish times. The Zozimas brothers should be especially mentioned. On account of the liberality and multiplicity of their gifts, they have been called the Greek Medicis. They aided education in Leghorn, Moscow, Ioannina, and elsewhere.

It must be noted with sorrow that the money of the university has more than once been a temptation to the honesty of those in whose care it was confided. According to reports lately handed in to Mr. Metaxas, the minister of education, some thousands of dollars were lost to the university in the year 1895-96 by carelessness of the rector and treasurer.

Along with the benefactors of the university should be mentioned the men who have given sums of money the interest of which is to be used in the giving of prizes for the best work done in literary or scientific contests (*ἀγῶνες*, *ἀγωνοθεσίαι*). Among these, one of special interest to us is the Cotting contest, *ὁ Κοττίγγειος ἀγών*, established by Dr. Cotting, a distinguished physician of Boston. Most of these contests are open to all who wish to compete, and are not reserved exclusively to students.

THE PRESENT UNIVERSITY BUILDINGS.

From the very beginning of the life of the university in the *οἰκία Κλεάνθους* it was evident that larger and more suitable buildings would have to be provided as soon as possible. A site for the main building of the new structures was selected, and the university authorities began to prepare for the undertaking. They had to rely entirely on the hopes of voluntary contributions. In the second year of the existence of the university Rector Ralles made an appeal for aid. Responses came immediately. Among the first was the Greek community of Galatz, which presented a gift of the timbers and other wood needed.

The building was begun with only 28,790 drachmas in the treasury. On July 2, 1839, the corner stone was laid. (See *Ἑλληνικος Ταχυδρόμος* for July 9, 1839.) The building did not proceed very fast, however, as the authorities kept within their resources. In November, 1811, one wing was brought to completion and was dedicated officially. This wing was immediately put into use, and from that time on the university has been housed in these new buildings. The entire structure was not completed until 1864.

THE UNIVERSITY LIBRARY.[1]

The library of the university has been created from gifts in money and in books from private individuals. It has been of no considerable expense to State or to university, and yet it is an excellent one, although not up to requirements in every respect.

[1] See *Ἡ Ἐθνικὴ Βιβλιοθήκη, ὑπὸ Εμμανουὴλ Ῥοΐδου.*

Among the first books received for the university library was a gift of 52 volumes sent by Governor Winthrop, of Massachusetts, in 1837. (See *Λογοδοσία Σχινᾶ*, p. 14.) The first professors gave from their private libraries whatever they could spare. Among the benefactors the Greeks of foreign lands were, as usual, conspicuous. Among them was Demetrios Galanos, one of the earliest Sanskrit scholars in Europe. After living and studying a long time in Calcutta and Benares he came to Athens, where he died in 1833, leaving 36,000 drachmas to the university and his books to the library. A number of manuscripts of translations which he made from the Sanskrit are still in the library. Some of them were published by G. K. Typaldos, the first ephor of the university library.

Since the completion of the new buildings of the new university up to the present time the library has been housed on the second floor of the main building, where it was naturally cramped for want of room. This fact gave opportunity to two rich brothers, natives of Zakynthos, who had amassed fortunes abroad, to benefit their fatherland by presenting it with a magnificent building to be used exclusively as a library. The splendid structure has been lately completed. It is in marble and of Doric style. It occupies and fills the square north of the university. On the façade is the inscription *φκοδομήθη δαπάναις τῶν ἀδελφῶν Βαλλιανῶν*. From the name of the donors the library is called the Ballianeion, *Βαλλιανεῖον*.

The library is rich not only in old printed editions especially of Greek works—editiones principes, and other rare editions—but possesses a large number of manuscripts. They are chiefly ecclesiastical or chronological works, and date from the fifteenth century down. They have been carefully examined by others, but especially by Mr. Sakkelion, who was an excellent palæographist. He died a few years ago. He published a number of smaller manuscripts, and made quite a complete catalogue of them all.

There is no printed catalogue of all the departments of the library, but the making of such a catalogue has been in hand for a number of years, under the direction of Dr. Michael Deffner, assistant librarian. The theological, philosophical, and philological portions of the catalogue have been published.

In many monasteries of Greece there once existed small libraries containing interesting old manuscripts. Most of what was valuable in these libraries, however, has been brought to Athens, especially to the university library, if not smuggled off to Europe. But in spite of this double and partly excusable despoliation, the monastery libraries contain even yet many a treasure.

Besides the university library there are other large collections of books at different places throughout the Kingdom. In Athens itself is the library of the Boulé, second in importance only to that of the university.

An interesting library is in Demitsana, a small town situated in the mountains a few miles east of Olympia. This library belonged to the famous school which Agapios remodeled in 1764. Many of the books were destroyed during the war. The wild Arkadians and Maniotes used them for making gun wads. Other of the more valuable works are now in Athens. But still the library is important. It is kept in the Hellenic school building. Evthymios Kastorches, professor of Latin at the university, wrote an interesting monograph on this library.

In Andritsæna, a small town in the northern part of Messenia, is another noteworthy collection of books. It was a gift to the town by Agathophron Nikolopoulos, a native of Andritsæna, who before the war of liberation traveled through different countries of the Levant, and having a great love for books, turned whatever money he made into the purchase of them. After Greece became free he gave them to his townsmen. It consists of about 20,000 volumes. Unfortunately, the books are not arranged and are not in the care of a librarian, but are stored up and are almost inaccessible.

The above libraries are mentioned on account of the peculiar interest that attaches to them. Numerous other modern libraries are to be found scattered throughout the Kingdom, in gymnasia and elsewhere.

SEMINARS.

(Φροντιστήρια.)

The knowledge presented to students through lectures would be of little value if not tested and assimilated by actual work done by the students themselves. The university in its phrontisteria and laboratories offers to the student the opportunity of not only testing the truth of the statements of his professor, but of making investigation for himself along a line of inquiry similar to that he observes his teachers to be following.

Of the phrontisteria the most important are those of Greek philology, of comparative philology, of Latin philology, of history, the mathematical seminar, the pedagogical seminar, the anatomical seminar, and the zoological seminar.

The chief laboratories are the following: Laboratory of general chemistry; laboratory of experimental physics; laboratory of pharmaceutical chemistry; pharmacological laboratory; phytological laboratory; histological laboratory; mikrobiological laboratory; pathological laboratory; laboratory for pathological anatomy; anatomical laboratory; botanical laboratory.

In these laboratories the students carry on research work, under the direction of the proper professors or other instructors. Some of these laboratories are well equipped for original investigation, but the work usually done is not so much in search of originality as to acquire a certain amount of experience and knowledge needed in some practical profession; and the laboratories are fitted out chiefly with this end in view. Good original work is, however, continually being done both by professors and students.

SCIENTIFIC COLLECTIONS.

In addition to the seminars and the laboratories, the university possesses, or has at its disposal, various collections of objects that supplement or assist the work done in the seminars and laboratories. Of such collections the most valuable are the National Museum of Antiquities, the Museum of Antiquities on the Akropolis, the Numismatical Museum, the Anthropological Museum, the Botanical Museum, the Pathological Museum, the Physiological Museum, and the Physiographical Museum.

The Anthropological Museum is under the care of Dr. Klon Stephanos. It is especially interesting on account of a collection of ancient skulls which Dr. Stephanos is engaged in making. He intends by means of comparative craniology to examine into what claims the modern Greeks have, from this point of view, to be regarded as blood descendants of the Greeks of classic times. He has skulls from the Mykenæan period, others from the tumulus at Chæroneia where the Theban legion fell fighting against Philip of Makedon, and others from other epochs of Greek antiquity.

Beside the seminars, laboratories, and scientific collections, mentioned, there are also a number of other places where a student may acquire knowledge and experience in certain lines. Some of these places are:

(1) The Botanical Gardens, situated at a distance of about ten minutes' walk from the Kerameikos gate, along the Holy Way which leads from Athens to Elevsis.

(2) The Astronomical Observatory, on the summit of the Hill of the Nymphs, west of the city. It was built in 1842, at the expense of the Baron Sina of Vienna, who also expended large sums in equipping it. Dr. Julius Schmidt, who for years was director of this observatory, did splendid work here. During his directorship, which ended with his death in 1884, he wrote more than 400 astronomical monographs. The Prussian Government bought his Lunar Chart for 20,000 thalers. (See Ἔσπερος, III, 340.)

(3) Students have also access to the public hospital, the Eye Institute, and the Lying-in-Hospital.

ENCYCLOPEDIA AND METHODOLOGY.

In each school provision has been made to have the encyclopedia and methodology of the different sciences taught; otherwise in some sciences, such at least as theology

or philology, it would be impossible for the student to orientate himself without immense labors, and wrong orientation would destroy him as a scientist forever.

The first teachers of encyclopedia and methodology were Kontogones in theology, Bambas in philosophy, Hertzog in law, and Bouros in medicine.

THE SCHOOL YEAR.

The year begins with the last two weeks of September and closes with the last two weeks of May. During this time there are two breaks in the continuity of instruction, one a rest of a few days at Christmas time and the other at the Easter holidays, which last two or three weeks. The end of the Easter holidays is so close to the end of the scholastic year that most of the students from the provinces, if they go home for the holidays, do not return to the university before the following September or October. All principal feast days of the church are holidays in the schools, and as these feast days are quite numerous free days come often.

So far as the students are concerned, there is nothing special, other than the enrollments at the beginning of the sessions, to mark the opening or the close of the semesters, as there are no examinations or other such exercises set exclusively for these times.

MATRICULATION.

The only condition for admission to the university is to present a proper dimissorial from one of the gymnasia of the Kingdom. But if the applicant is from abroad, his dimissorial must be from a gymnasion recognized by the Greek authorities. The gymnasia mostly concerned are the Greek schools of the Turkish Empire and Egypt. The following schools in Turkey are officially recognized as being on equal footing with the gymnasia of Greece: The Grand National School at Constantinopol; the Theological School on the Island of Chalke; the Greek Business School of Constantinopol, Εμπορικὴ Σχολή; the Zozimæan School of Ioannina; the Theological School of Jerusalem; all of which have been recognized from the beginning. The following have been officially recognized in the year indicated for each one: The Evangelical School of Smyrna, in 1862; the Gymnasion of Chios, in 1863; of Samos, in 1872; of Thessalonika, in 1875; of Mitylene, in 1875; of Bitolia, in 1884; of Herakleion, in Krete, in 1883; of Kydonia and of Neapolis, in Krete, in 1884; the Zariphæan Schools of Philippopolis, in 1885.

If the applicant from abroad has no dimissorial, his only resource is to present himself for examinations in a gymnasion of Greece. If he brings a dimissorial with him, it must be attested by the consul of that Government at Athens, or by the Greek consul in the country of the gymnasion in question. In August, 1875, the president of Harvard University wrote to the rector of the Greek university regarding conditions for admission of Harvard students to the university. The rector replied that in this regard the students in question would be treated just as citizens of Greece. (See Πρακτικὰ Συγκλήτου, for August 17, 1874; and Pantazides's Χρονικόν, p. 285.)

Enrollments are made only at the beginning of the semesters. They must be renewed at the beginning of each following semester. After enrollment the student is his own master. He is supposed to attend regularly and to become, as soon as possible, a member of such seminars or a worker in such laboratories as his science demands. But, however, if he neglect these obligations he will not thereby create any disturbance for himself until his time for examinations come; then he will probably fail. If he become a member of laboratory or seminar, he is obliged to do such tasks as his professor imposes or recommends; otherwise he is free to study as he pleases. He has no examinations except those for degrees.

COURSES OF STUDIES.

With the exception of the students of pharmacology, all candidates for degrees must follow two courses of studies. One of these courses is made up of what are

called the general studies, *τὰ γενικὰ μαθήματα*, and the other consists of the branches that are special to each science.

A student may present himself for examination in the general studies any time after he has completed two years in the university. If he fail in any one or more studies at this general examination, he may present himself for reexamination in such study or studies after the lapse of one year.

The general studies are the following:

In theology.—Metaphysics, ethics, and psychology; ancient, mediæval, and modern history; Hebrew grammar.

In law.—Logic, psychology, and ethics; ancient, mediæval, and modern general history.

In medicine.—Botany, chemistry, physics, mineralogy, and geology, zoology, and experimental physics.

In philosophy.—In the department of philology: Logic, psychology, æsthetics, and ethics; experimental physics; ancient, mediæval, and modern general history. (Philologs are obliged also to attend lectures on natural law in the school of law, and must attend certain courses in mathematics.) In the department of physics: Logic, psychology, æsthetics, and ethics; ancient, mediæval, and modern history; linear and spherical trigonometry; analytical geometry; higher algebra; elements of mechanics. In the department of mathematics: Logic, psychology, and ethics; ancient, mediæval, and modern history; experimental physics, and physics with mathematical demonstrations; mineralogy and geology.

SPECIAL STUDIES.

In theology.—First year: Attendance at certain lectures in Greek and Latin philology; introduction to Old and New Testament; history of Old and New Testament; interpretation of Old and New Testament; encyclopedia of theology. Second year: Interpretation of Old and New Testament; Biblical criticism; interpretation of sacred scriptures; church history; history of dogma; Christian archæology; symbolics; patrology. Third year: Interpretation of Old and New Testament; dogmatic theology; moral theology; history of dogma; apologetics. Fourth year: Homiletics; catechetics; liturgy; canon law, practical portions; interpretation of Old and New Testament; pastoral theology.

In law.—First year: History of Roman law and the introductions of Roman law; Roman law; political economy; political pleading; natural law. Second year: History of Roman law and introductions of Roman law; Roman law; political economy; administrative law; commercial law; penal law; natural law. Third year: Roman law; civil dikonomy; commercial law; penal law, or penal dikonomy; constitutional law, or international law. Fourth year: Roman law; political dikonomy; penal dikonomy; international and constitutional law; ecclesiastical law.

In medicine.—First year: Anatomy. Second year: Anatomy; physiology; general pathology; pharmacology. Third year: Physiology; general pathology; pharmacology; surgical pathology; special nosology; pathological anatomy; clinical practice; ophthalmology; surgery, with practice in ligaments and explanation and use of surgical instruments; hygiene. Fourth year: Special nosology; surgical pathology; pathological anatomy; medicinal clinics; surgical clinics; clinic for children's diseases; eye clinic; clinic for syphilitic diseases; medicinal jurisprudence; hygiene; midwifery.

In philosophy.—Philological department. First year: Encyclopedia and methodology of philology; interpretation of Greek and Latin poets, and prose writers; linguistics, i. e., Greek and Latin grammar, and general principles of comparative grammar; history of ancient art; Greek and Roman antiquities; history of philosophy; mythology; history of the Greek people. Second year: Interpretation of Greek poets and prose writers; interpretation of Latin poets and prose writers;

linguistics; history of ancient art; Greek and Roman antiquities; mythology; history of the Greek people. Third year: Interpretation of Greek poets and prose writers; interpretation of Latin poets and prose writers; hermeneutics, and criticism; linguistics; history of Greek literature; history of Latin literature; polity of the Romans; Greek and Roman antiquities; pædagogics; meter. Fourth year: Interpretation of Greek poets and prose writers; interpretation of Latin poets and prose writers; history of Greek literature; history of Latin literature; Greek and Roman antiquities; hermeneutics and criticism; pædagogics; meter; linguistics. Department of physics. First year: General chemistry; experimental physics. Second year: Experimental physics; general chemistry; zoology; mineralogy and geology. Third year: Mineralogy and geology, organic chemistry; physics with mathematical demonstrations. Fourth year: Astronomy; mineralogy and geology; organic chemistry; physics with mathematical demonstrations. Department of mathematics. First year: Trigonometry; introduction to higher algebra; plane analytical geometry; higher algebra; experimental physics, and physics with mathematical demonstrations; elements of astronomy. Second year: Differential calculus; solid analytical geometry; spherical astronomy; physics with mathematical demonstrations. Third year: Integral calculus; theoretical astronomy. Fourth year: Theoretical mechanics; theoretical astronomy.

THE SCHOOL OF PHARMACY.

To obtain entrance as student into the school of pharmacy the applicant must present not only his dimissorial from a gymnasion but also a testimonial from a recognized pharmacist stating that the candidate has studied with him for one year after completing his course in the gymnasion, and has therefore a year's experience in practical pharmacy.

The course of studies in the school of pharmacy covers three years. The branches taught are as follows:

First year: General experimental chemistry; experimental physics; zoology; botany; pharmacology; pharmaceutical chemistry; experiments in the laboratory of general chemistry.

Second year: General experimental chemistry; experimental physics; mineralogy; botany; practice in the botanical laboratory; pharmacology; pharmaceutical chemistry; practice in the laboratory of pharmaceutical chemistry.

Third year: Toxicology; practice in the laboratory of pharmacology; pharmaceutical chemistry; practice in the laboratory of pharmaceutical chemistry.

EXAMINATIONS AND DEGREES.

The degrees conferred in course are that of licentiate in theology (*Προλόγης τῆ θεολογίας*), master in philosophy, and doctor in philosophy, law, and medicine. In pharmacy a diploma, but no degree, is given.

As already said, the university students undergo no entrance examinations nor yearly examinations.

The examinations in the general studies have been mentioned already.

The masters' examinations (*Διδασκαλικαὶ ἐξετάσεις, ἐξετάσεις Ἑλληνοδιδασκάλων*) are open to all students that have completed a two years' course in the school of philosophy and have already successfully passed the examinations in the general studies. The candidate is examined in Greek, Latin, archæology, and mathematics.

To be able to offer one's self for the doctor's examinations (*διδακτορικαὶ ἐξετάσεις*) one must have completed a four years' course of university work, either at the University of Athens or at some other university. It is not necessary that the candidate be enrolled as a student of the university at the time of his examinations. The candidates must have already passed the general examinations.

The doctors' examinations, are both written and oral. If a candidate fail in his examinations, he may present himself again after the lapse of a year.

The examinations for the doctorate, especially in the school of philosophy, are much more severe than in other universities. On the other hand, but little importance is attached to the written dissertation. The candidate is not obliged to publish it; it is sufficient that he leave a copy of it plainly written in the archives of university. From the year 1844 up to the year 1853 all candidates for the doctorate were entirely excused from the obligation of presenting a dissertation. The dissertation may be written in Latin or Greek. Philologians must write their Greek dissertations in the ancient language. All other candidates may write in modern Greek. The first dissertation ever presented in Latin was that of Konstantinos Hadjidemetriou, on Studia Vergiliana in 1895. Professor Sakellaropoulos, in accepting the dissertation, took occasion to state that he was glad to finally see a dissertation in Latin, and bases his approval of the dissertation on the fact of its being in that language. (See his approval of the dissertation published with same.)

After the dissertation has been accepted by the faculty, a day is appointed for the formal conferring of the degree.

CONFERRING OF THE DOCTORATE.

(Αναγόρευσις.)

The formal conferring of the degree takes place in the presence of the rector, the dean, and the professors under whom the candidate studied. The affair is a public one, but of course the university does not send out invitations. The candidate invites his friends.

The dean calls the candidate, who then reads the doctor's oath. This is different for each school. It is written in Hellenic for all schools save that of medicine, which, out of regard for the old physicians of antiquity, Hippokrates, Galenos, etc., has its oath in Ionic. It is sufficiently interesting to be quoted here.

*Ἐπειδὴ ἡ διάσημος τῶν Ἰητρῶν Σχολή, τοῦ Πρυτάνιος ἐπινεύοντος, ἐς τους ἑαυτῆς * * * δοκιμάσαι με κατηξίωσεν, αυτῇ τε και τῇ Πρυτανιήῃ δημοσίᾳ τήν δε δίδωμι πίστιν· Ηγήσεσθαι μὲν τοὺς διδάξαντάς με ταύτην τὴν τέχνην ἴσα γενέτησιν ἐμοῖσι, τῇ δε τέχνῃ μηδεμᾷ 'επ' ευμαρίῃ χρήσεσθαι τῇ ἐμεαυτοῦ ἐν τῷ βίῳ, ἀλλ' ἐς δόξαν θεοῦ καὶ ἀνθρώπων σωτηρίην, καὶ τῆς πίστεως αυτῆς τιμήν τε καὶ ὠνησιν. Πᾶν μὲν ὅ τι ἰητροῦ ἔργον ἐστί, πιστῶς καὶ ἀκριβῶς κατὰ δύναμιν καὶ κρίσιν τὴν ἐμὴν ἐπιτελέων, τοῖσι δὲ νοσέουσι, ἣν τε πλούσιοι τύχωσι, ἣν τε πένητες ὁμοίῃ σπουδῇ τὴν ἐκ τῆς τέχνης ἐπαγινέων ἐπικουρίην· μηδὲ παραβόλως ἀποπειρώμενος τὴν τεο ζόην ἀποκινδεύσειν μηδ' ἰητρεύσειν ἐπὶ χρηματισμῷ ἢ φάτιος ἱμέρῳ, ἐς οἰκίας δὲ ὁκόσας ἂν ἐσίω, ἐσελεύσεσθαι ἐπ' ὠφελίῃ καμνόντων, ἐκτός ἐὼν πάσης ἀδικίης. ἃ δ' ἐν θεραπηίῃ ἢ ἰδω ἢ ἀκούσω ἢ καὶ ἀνευ θεραπηίης κατὰ βίον ἀνθρώπων ἃ μὴ χρή ποτε ἐκλαλέεσθαι ἔξω, σιγήσεσθαι, 'ἄρρητα ἡγεύμενος· τῆς δὲ τέχνης ἐπιμελήσεσθαι κατὰ δύναμιν, σπουδὴν πλείστην ποιεύμενος ἀκριβῶσεα ταύτης τὰ θέσμια. Τοῖσι δὲ ὁμοτέχνοισι φιλόρονα καὶ φιλάνθρωπον ἐμεαυτὸν αἰεὶ παρέξειν καὶ σφέας ἀδελφεοῖσιν ἴσον ἐπικρινέειν 'ἄρρεσι, πᾶν σφι προθύμως συμβαλλόμενος ἐξ ὅτεο ἂν ὠφελίῃ γένοιτο τοῖσι κάμνουσι· ταύτην μοι τὴν ἐπαγγελίην ἐπιτελέα ποιέοντι εἴη ἐπαύρασθαι βίου καὶ τέχνης καὶ θεὸν κτήσασθαι ἀρηγόνα, παραβαίνοντι δε, τανantία τουτέων."*

After the reading of the oath the dean confers the degree, with the permission of the Prytanis and in the name of the school.

EXAMINATIONS FOR DIPLOMA IN PHARMACOLOGY.

To obtain a diploma in pharmacology, the candidate must have completed three years in the university and have already passed a written examination in botany, chemistry, pharmaceutical chemistry, physics, mineralogy, and geology, as well as on the subject of his experiments in the laboratories of chemistry and pharmaceutical chemistry.

He is examined by a board, consisting of the professors of phytology, chemistry, pharmaceutical chemistry, physics, mineralogy, and geology. If he passes the examination, he receives his diploma; if he fails, he may appear before the board, after the lapse of a year and try again.

Six months from the time of his receiving his diploma he may appear before a board of physicians (*Ιατροσυνέδριον*) and pass examinations for permission to practice, provided that he bring testimony showing that he has devoted the six intervening months to practical work in a recognized pharmacy.

PHYSICIANS' EXAMINATIONS FOR LICENSE TO PRACTICE.

After a student has won his degree of doctor in the school of medicine, he then visits the director of the city clinic, who enrolls him among those that may study and practice there. After studying in the clinic for nine months he presents himself for examinations for permission to practice (*πρακτικαὶ ἐξετάσεις*). He is then examined in pharmacology, medicinal jurisprudence, surgery, and midwifery, as well as in medicinal and surgical clinics in the hospital.

HONORARY DEGREES.

The university has fortunately kept itself away from the temptation of giving honorary degrees. The only school that has shown any strong tendency to giving such degrees is the school of theology. This school has conferred eight or nine. But for a school that has been in operation for sixty years this number is not large. The school of law has conferred two, namely, on Leon Gambetta, in 1879, and on Zachariae von Lingenthal, in 1884. Both men deserved well of Greece, the one as a statesman, the other as professor and writer on Byzantine law.

The school of medicine has conferred one honorary diploma, on Prof. Rudolf Virchow, on the occasion of his visit to Athens in 1879.

The school of philosophy has never given an honorary degree.

THE UNIVERSITY STUDENT.

The Greeks of to-day, like their renowned ancestors, are exceedingly clannish. This clannishness is naturally found among the students of the university. Those from the same locality usually go together. On this account they never have formed any large and lasting societies other than those in which the membership is limited to students from certain provinces or countries.

Although the student is not a strong social or political factor, yet at times he makes himself and his influence felt. He has always been ready to take up his gun and act the patriot soldier whenever occasion offered itself. This showed itself in 1862, when the insurrection against the rule of King Otho brought disorder everywhere. The students then organized themselves, together with the professors, into a military body of about 600 men. They drilled regularly, professor standing side by side with student in the ranks, and served honorably and efficiently as city guards until peace was restored. They patrolled the city night and day. The good services of this body of military students and professors (*ἡ Πανεπιστημιακὴ φάλαγξ*) were so evident that no haste was shown to disband it after the trouble was over. It thus continued to exist legally until the year 1878.

The students are as a rule quite orderly, yet at times their hot southern blood controls them. Their clannish spirit sometimes brings them to take sides with one rival professor against another, or with one docent against another. Sometimes they express their likes and dislikes so strongly as to necessitate the temporary closing of certain lecture rooms or laboratories. (See Mistriotes *ἐν τοῖς κατὰ τὴν Πρυτανείαν αὐτοῦ*, 1890–91, p. 75.)

When these outbursts of sentiment or displeasure take place the students interested, if numerous, often hold their meetings in the open square in front of the main buildings of the university or in the portico of the main entrance. This entrance is called "the Portals," *τὰ Προπύλαια*. And a call to the students made through the daily papers to meet at a certain hour at the Propylæa indicates that some affair of importance to the students, or perhaps of trouble to the authorities, is in the air. When these meetings take on a political character, or are demonstrations

against some measure of the Government respecting education or students, the police are sometimes employed to disperse them. Once, under the excitement of protesting against the taxes levied on all students by way of fees by Minister Trikoupes, their meeting was cut short by the sudden appearance of a company of firemen with engines, who turned full streams of water on the crowds of students, and they, drowned into submissiveness, dispersed.

At times the students act boisterously not only on account of matters that closely affect them as students, but from other motives. Every Greek is a politician; accordingly, the student can not refrain from coming at times under political influence. A notable instance is that of the Skiadists, Σκιαδισταί. These were young students, who in the spring of 1859 wore large straw hats, σκιάδια, made in Siphnos. They wore them not only on account of their cheapness, but as a protest against imported European articles, and as a protest in general against the Government. They were ridiculed and mocked by other young men, not students, of an opposite faction. This led to riotous disturbances and caused the closing of the university for several days. These demonstrations of the Skiadists were the forerunners of the insurrection of October, 1862, which resulted in Otho's expulsion.

The university students represent by parentage no one class of society; the lowest origin does not make young Greeks hesitate, they being the most democratic of peoples. The son of the shepherd or of the gardener is conscious of no vital inferiority to the son of the Chian banker or the Phanariote of Constantinopol; and on the feast day the banker's son and the Phanariote and the descendant of the patriot of 1821 will touch glasses with the rudest peasant. This easy equality, which exists everywhere, exists also among the students.

The great love of education and the desire of every community and every family of any prominence whatsoever to have a representative in the "aristocracy of science" causes the higher schools, and especially the university, to be overcrowded. These doctors, after finishing their studies and enjoying the felicitations of their friends, find it difficult to earn their daily bread at times.

It would be better for science and for the general advancement of the nation if the higher ranks of education were more exclusive.

WOMEN STUDENTS IN THE UNIVERSITY.[1]

Although woman is highly respected in Greece, yet, as we have already seen, it is only of late that she has been brought into a position to seek the advantages of more than an ordinary book education. But the women of Greece, no matter what their rank, possess a certain natural intelligence and refinement that atone for much learning derived from books.

The entire system of education, as established immediately after the war, was intended for boys. True it is that schools were established for girls, but these schools were conducted on a different scale from those for boys. The curriculum of studies was simpler. It is only after the Philekpaedevtike Etaeria had taken the matter in hand that more attention was paid to the education of girls. Through the efforts of this society they came to have schools equal almost to the gymnasia for boys.

But the ambition for higher studies once aroused and allowed to manifest itself, did not stop with the curricula of the gymnasia, and bright young maidens soon thought of applying for admission to the university. In autumn of the year 1890 when Mistriotes was rector (see Mistriotes *τὰ κατὰ τὴν Πρυτανείαν*, 1890–91), two or three young women applied for the privilege of being enrolled as regular university students. The matter was referred to the senate of the university. The senate, although not in favor of allowing women to be enrolled, nevertheless felt that they could not justly forbid their enrollment, and accordingly gave their consent. The

[1] See Ἡ Ἑλληνὶς ἐν τῇ Ἐπιστήμῃ ὑπὸ Εὐγενίας Ζωγράφου, in the Ατλαντίς for 1892.

minister of education was also consulted by the senate, and likewise did not forbid the enrollment. Since that time nearly all the courses of the university are open to women. The first to take advantage of this new privilege was Miss Ioanna Stephanopoli, who matriculated that very year.

Naturally the number of applicants for the new privilege did not swell into large proportions, because the number of graduates from the Arsakeion and other schools that could prepare candidates for the university, was not large. However, in the year 1894-95 we find the number of woman students increased to five. Once admitted, they begin to show their ability to follow their courses intelligently—for in the year 1896-97, two sisters, Angelike and Alexandra Panagioton, from the Island of Kephallenia, finished their course in the school of medicine, winning the doctorate with the grade of *ἄριστα*.

But even before the doors of their own university were opened to women, they had sought the privilege of higher education elsewhere. The first Greek woman to study in a university seems to have been Sebaste N. Kallispere. She studied in the Sorbonne, and received the degree of doctor in philosophy in July, 1891, after a course of studies covering a period of seven years. Her example was followed by Miss Kalopothakes, who studied medicine in Paris, and is now a prominent and kind physician at Athens.

GREEKS IN THE UNIVERSITIES OF EUROPE.

Before the Greeks became free it was customary, as we have seen, for many young men to go to Europe in order to enjoy the advantages of education. This practice of going to Europe is still more common than need be. Three classes of students go to Europe, (1) those that are desirous of pursuing some line of study not yet well taught at Athens, or who, after having completed their course at Athens, wish to know and to study under eminent Europeans; (2) those that imagine it to be more noble to study abroad than in one's own country, and (3) those who fear that they might have difficulty in passing the examinations in their own university. This last class is not so small as one might think.

Mr. Demetrios Bikelas, in an article on "Paris and light literature" (*Τὰ Παρισια καὶ ἡ ἐλαφρὰ φιλολογία*, in his *Διαλέξεις καὶ Αναμνησεις*, 1893), well describes the bad effect that Parisian life has on some of the young Greeks that go there to study.

THE POLYTECHNIC INSTITUTE.[1]

(*Τὸ Μετσόβειον Πολυτεχνεῖον.*)

During the days of oppression the Greeks had little opportunity of learning or of practicing the finer arts. With the exception of architecture and painting nothing in this line was needed. Even architecture produced no new principles, and painting flourished only in a few centers such as Mount Athos. (See Die Kunst in den Athos-Klostern, von Heinrich Brockhaus, Leipzig, 1891.) Painting, too, had lost all of its life, and was a mere reproduction of stereotype forms as can be seen from the manual of Christian Ikonography by Dionysios of Agrapha. *Ερμηνεία τῶν Ζωγράφων ὡς πρὸς τὴν ἐκκλησιαστικὴν ζωγραφίαν ὑπὸ Διονισιου τοῦ Ιερομονάχου καὶ ζωγράφου τοῦ ἐκ Φουρνᾶς τῶν Ἀγράφων * * * Αθήνησι*, 1853. It has been published in translation also; Manuel d'Iconographie Chrétienne, Grecque et Latine, Paris, 1845.

Accordingly when the Greeks gained their independence they had much to do in this line. Kapodistrias made a good beginning by sending to Italy some young men who wished to study the fine arts.

In the year 1836 a royal decree was published on the last day of the year, establishing a school, where on Sundays and holidays instruction in architecture was to

[1] See the *Πανδώρα*, III, pp. 396–400.

Ορισμος τοῦ Σχολείου τῶν Βιομηχάνων Τεχνῶν εν Αθήναις, 1890.

Much information has been kindly furnished by the secretary of the institute, Mr. A. Mavrides.

be given to such as wished to become builders, etc. Thus began the Polytechnic Institute.

The measure was a popular one, and the school continued to operate under these conditions until 1843. During these six years the school was under the management of Zetner, a mechanician from Munich. Two thousand three hundred and ninety men took advantage of these courses in architecture. Although no architects were created—that would be impossible under the circumstances—yet the school did much good by producing a number of trained workmen and builders. Such men were much needed, as entire cities had to be built up.

The changes in the Government brought in by the events of 1843 caused modifications in this school, as it caused them in almost every other institution of the country. The school was rearranged into three departments. The first of these departments was intended for those who wished to learn some kind of skilled workmanship. In this department instruction was given only on Sundays and holidays. The second department was for those who wished to learn the arts and sciences connected with manufacture. This school was open daily. The third department was devoted to the fine arts. The institute continued to operate on this plan up to the year 1863. During this second period attention was paid to the fine arts, especially to sculpture, engraving, and ornamental design. The director of the institution was Lysandros Kaftansoglos, an architect of high ability, and an advocate of the study of the fine arts. Accordingly these flourished under his enthusiastic management. During this period the school was attended by 8,941 students.

In August, 1863, the Provisional Government reorganized the institution again, establishing a school of the applied arts, a school of the fine arts, and a school in which instruction was given on Sundays. The school of applied arts (*Βιοτεχνικὸν Σχολεῖον*) ceased to exist under this name in 1891. During this period this school was remarkably successful. It was attended by 5,396 students. In 1891 it was thoroughly reorganized and now bears the name of the *Σχολεῖον τῶν Βιομηχάνων Τεχνῶν*. It is to-day the principal and most prosperous school of the Polytechneion. The other schools need remodelling and revivification. Plans have been drawn up for this purpose, but have not yet been approved of by the Boulé. The present director of the institution is Mr. A. Theophilas, who has held the position since 1878. The school of the fine arts has been making good progress. It has produced sculptors and painters and architects that reflect honor on their country. Among the sculptors Leonidas Droses and Georgios Broutos are worthy of mention. Droses was professor of sculpture from 1868 up to the time of his death in 1882. Broutos is at present professor of sculpture.

Since 1893 the school of the fine arts has been open to women students. Within the last four years 361 women students have availed themselves of this privilege.

The splendid buildings in which the schools are held are gifts of three natives of the town of Metsobo. Hence the name of the institution, *Μετσόβειον Πολυτεχνεῖον*.

CURRICULUM OF STUDIES IN THE POLYTECHNICAL INSTITUTION.

The School of Applied Arts (*Σχολεῖον τῶν Βιομηχάνων Τεχνῶν*).

This school is intended to prepare skilled men for the service of the Government and for mechanical professions. The school is divided into three departments: A department of civil engineering, a department for machinists, and a department for surveyors, master workmen, and practical machinists.

In the department of civil engineering the course extends over four years, as follows:

First year: Analytical geometry; descriptive geometry, with application of same; elementary mechanics; epipedometry, with practical application of same; physics; chemistry; mechanical drawing, and exercise in the use of arms.

Second year: Differential and integral calculus; chorostathmesis, with application of same; building and building materials; road making; mineralogy and geology;

theoretical mechanics; history of art; mechanical drawing, and exercise in the use of arms.

Third year: Applied mechanics, bridge building, house building, architecture, mechanology, forestry, æsthetics, mechanical drawing, and exercise in the use of arms.

Fourth year: Harbors, railroads, house building, architecture, governmental law, bookkeeping, mechanical drawing, and exercise in the use of arms.

In the department for machinists the course is as follows:

First year: Analytical geometry; descriptive geometry, with practical application of same; elementary mechanics; measuring of buildings and machines; practice in the ironworks laboratory; chemistry; mechanical drawing, and exercise in the use of arms.

Second year: Differential and analytical chemistry; theoretical mechanics; house building; building materials; practice in the ironworks laboratory; mechanical drawing, and exercise in the use of weapons.

Third year: Applied mechanics; the steam engine and kinematic mechanics; house building; mechanology, with constructions; chemical technology; practice in the ironworks laboratory; mechanical drawing, and exercise in the use of arms.

Fourth year: Iron portions of bridges and houses; construction of machines; metallurgy of iron; practice in the ironworks laboratory; mechanical drawing, and exercise in the use of arms.

In the department for surveyors, master workmen, and practical machinists the course extends over two years and a half. The last half year is devoted entirely to practical exercises. The course for the two full years is as follows:

First year: Mathematics; elementary mechanics; descriptive geometry; epipedometry, with practical application of same; road making; mechanology; house building; building materials; mechanical drawing; practice in laboratory, and exercise in the use of arms.

Second year: Chorostathmesis, with application of same; measuring of buildings and machines; bridge building; the steam engine; forestry; mechanical drawing; practice in the laboratory, and exercise in the use of arms.

LIST OF PROFESSORS AT PRESENT TEACHING IN THE POLYTECHNEION.

In the school of applied arts.—Prof. A. Soules, applied mechanics; Prof. I. Argyropoulos, on railroads; Prof. I. Lazarikos, topography; Prof. I. Raptakes, building; Prof. I. Kolliniates, architecture; Prof. I. Hatzidakes, theory of mechanics; Prof. Kyparissos Stephanos, higher mathematics; Prof. A. Apostolou, descriptive geometry; Prof. I. Chrysochoou, harbors and hydraulics; Prof. T. Maltezos, steam engineering; Prof. P. Kyriakos, mechanology and construction of machines; Prof. E. Angelopoulos, road building and bridge building; Prof. A. Bousakes, applied chemistry; Prof. A. Chrestomanos, physics; Prof. K. Metsopoulos, mineralogy and geology; Mr. A. Balbes, curator in chemistry; Mr. N. Germanos, curator in physics; Mr. N. Karakastinides, curator in mathematics; Prof. L. Lantzas, mechanical drawing.

In the school of the fine arts.—Prof. N. Lytras, painting in oil; Prof. Georgios Broutos, sculpture; Prof. B. Lantzas, ornamental design and perspective; Prof. K. Bolanakes, thalassographia; Prof. G. Roilos, drawing from casts; Prof. N. Pherbos, engraving; Prof. D. Katerinopoulos, artistic anatomy; Prof. A. Kaloudes, tracing.

THE ODEION.

This is an establishment for the purpose of producing musicians, singers, and actors for the Greek stage, and also for preparing teachers of music for the different schools throughout the kingdom. As a school of preparation for the stage, it has not as yet produced any remarkable results, but as a school for teachers of music in the public schools it has done much good.

The system of instruction embraces five different departments—a preparatory

school, a school for instrumental music, a school for vocal music, a school for the theory of music, and a dramatic school.

In the dramatic school are taught enunciation, declamation, voice culture, calisthenics, nature and quality of dramatic personifications, rhythm and meter in language, personification of characters both theoretically and practically.

Beside these special courses all students at the Odeion must, unless excused on grounds of proficiency, take the history of music, the history of the theater, general literature, and the French and Italian languages.

Table showing the growth of the Odeion in a period of five years.

Year.	Number of students.	Hours of instruction per week.	Tuition money received (in drachmas).	Money paid out in salaries (in drachmas).
1890-91	98	132	5,336.00	14,503.95
1891-92	152	180	15,177.00	22,126.50
1892-93	163	227	26,429.00	28,029.50
1893-94	171	235	26,307.50	33,253.00
1894-95	198	251	29,812.00	35,402.50

THE ACADEMY.

Ever since they have become free it has been the dream of educated Greeks to have an organized body of learned men, such as those of the academies of France, Germany, and other countries of Europe. That wish has not been fulfilled. But although an academy of immortals does not exist in Greece, a suitable edifice has nevertheless been erected for their use. The building is the gift of a rich Greek, Baron Sina, of Vienna. The architect was Hansen. It is in Ionic style, and is perhaps the most beautiful of all the new edifices in Athens. It is entirely of Pentelic marble.

At present its chief use is to serve as a numismatic museum, where the immense and valuable collection of coins, ancient Greek and Byzantine, is preserved.

PRIVATE SCHOOLS.

Private schools are numerous, both for girls and for boys, and are of all grades, from the demotic to the gymnasion. Of these private institutions some are under special religious influence, but others and most of the private schools are different in no way from the regular schools, except for a more careful and parent-like watchfulness over the pupils in time of recreation, and greater solicitude for their conduct, etc. Some of the private schools also receive boarders, which the regular schools do not do.

The establishment of private schools is subject to no unpleasant restrictions on the part of the Government. The courses of studies must conform to what the Government requires, the teachers must possess a regular license, and the law concerning the teaching of religion must be obeyed. When these conditions are likely to be fulfilled, the formal permission to conduct a private school is immediately granted.

School terms begin and end at the time appointed by law. Examinations are conducted in the same way as in the public schools, and the department of education is represented on the board of examiners.

Whoever is found guilty of establishing or conducting a school without attending to all the requirements of the law, is subject to punishment under article 532 of the penal law of the Kingdom.

PRIVATE SCHOOLS UNDER SPECIAL RELIGIOUS DOMINATION.

Circumstances have brought it about that the modern Greeks identify their religion with their national existence. They love its magnificent ritual, its gorgeous ceremonial, its fine mysticism, its subtile dogma. Religion bound and binds them

all into one body. It identifies itself as a personal possession with every Greek, whether plebeian or aristocrat. * * *

Since the Greek loves his church so intensely, he naturally dislikes all destructive opposition to it. He may not see anything intrinsically bad in other forms of Christian worship, yet he dislikes them if they threaten to bring about the destruction of his own religion. On these grounds he is opposed to the introduction of foreign forms of Christianity into his country and among his people. He has ceased to desire to proselytize, thinking that the other varieties of Christianity are good enough in their own home. Since schools are powerful means for introducing new religions, he has always looked with suspicion on schools established under control of teachers of another religion. Viewing the matter from the Greek's standpoint, we wonder at his liberal leniency. The establishment of such schools has always been allowed, although at times there have been popular outbreaks against individual schools.

The first to establish schools of this kind were various orders of Catholic religions. The Jesuits, for instance, had excellent schools in Andros and Melos and Naxos and elsewhere in the seventeenth century.

Religious communities of nuns and sisters have also established schools in most of the large cities of Greek lands. In free Greece there are such schools in Athens, Patras, Kerkyra, Tenos, Naxos, and elsewhere. These schools are intended chiefly for the children of Catholic inhabitants, citizens, and resident foreigners, and no attempt at proselytizing is made. Though not intended for children of Orthodox Greeks, yet such parents often send their daughters to these schools in order to have them learn French, which is taught practically in these schools. This attendance of Orthodox children sometimes brings about unpleasant friction between the followers of the two religions, for at times there appears a suspicion of proselytizing, and this is forbidden expressly by the constitution. In 1869 and 1870 the Catholic schools of Kerkyra gave rise to such talk that the matter was brought before the Boulé in Athens. And under date of March 3, 1871, Mr. A. Petmezas, minister of education, issued a circular to the nomarchs of the country enjoining the strict inforcement of the law concerning schools under other religious influences. He emphasizes the fact that instruction in religion must be given by a teacher of the same religion as that of the pupils. (*Θεσμολόγιον*, I, pp. 391, 392.)

The most important school under Catholic management is the Leonine Lyceum in Athens (*Τὸ Λεοντειον Λυκειον*), established by Pope Leo XIII at the time of the celebration of his Golden Jubilee. The school is intended for the sons of Catholics. It ranks as a gymnasion, and its courses are fully in accordance with the requirements of the State. It has an excellent corps of professors.

Protestants have also established schools in Greek lands. In 1831 the Hill school was founded.

THE HILL SCHOOL.[1]

(*Τὸ Παρθεναγωγεῖον Χίλλ.*)

This school takes its name from its founders, Dr. and Mrs. Hill. On the 7th of December, 1830, Mr. and Mrs. Hill landed in Syra, one of the islands of the Greek Archipelago. They had been sent to Greece by the Missionary Society of the Protestant Episcopal Church. Mr. Hill, a graduate of Columbia College, New York, had studied theology in the seminary at Alexandria, Va., and was ordained a clergyman shortly before his departure for Greece. After living a few months on the island of Tenos, whither they had gone from Syra, they went to Athens, where, on July 18, 1831, they opened a school in their own house. The school prospered and did much

[1] See Service Commemorative of the Life and Work of the Rev. John Henry Hill, held in Calvary Church, New York. New York Bible House, 1882.

good. The Hills, at the advice of the missionary society, and with their own good taste, supported by their knowledge of how the Athenians felt toward proselytizers, carefully abstained from meddling with the religion of their pupils. Still, since religious exercises were held in the school, such as the reading of portions of the Bible, the recitation of the Nicene Creed, the Lord's Prayer, etc., the Greeks felt uneasy. This suspicion grew into open attack in 1842, led and encouraged by the Αιών, one of the most influential papers of Athens at that time. However, the storm blew over and the school continued.

Almost from the beginning the Hill institution consisted really of two schools—one a free school supported from America, and the other a private school supported by its income from the pupils. This private school continues to the present time, and is now under the management of Miss Masson. The free school is also still in existence, and is under the management of Miss Muir.

In 1869 Dr. Hill resigned the control of the free school on account of his age. He died at Athens, July 1, 1882. The Greek Government honored his funeral, and the common council of Athens resolved to erect a marble column in memory of his services in behalf of education.

Two years later Mrs. Hill died and was buried beside her husband in the English cemetery at Athens. An account of her funeral was sent to the State Department at Washington by Mr. Eugene Schuyler, then minister to Greece, under date of August 6, 1884. He mentions the honors shown her and the sympathy expressed.

After the death of its founders, it was decided to continue the private school as a memorial school. Three thousand pounds sterling were raised, and with this the school property was purchased. The private school is not now under the care of the mission, but is supported entirely by the tuition fees and an occasional gift from America.

During the scholastic year of 1896–97 this private school accommodated 30 boarders and 120 day pupils. In spite of the fact that the school is sadly in need of funds, it continues to retain its high standard under the prudent control of Miss Masson. Its pupils always excel in the examinations.

TURKISH AND JEWISH SCHOOLS IN THESSALY.

After the addition of Thessaly and a small portion of Epeiros to Greece in 1881, the Greek Government immediately devised means of providing for the education of such of the inhabitants of the new provinces as were not of the Greek faith. These were Mussulmans and Jews.[1]

The Government made provision that wherever the size of a Jewish or Mussulman community warranted it a special school should be established for them. In the Jewish schools were to be taught, along with the courses of regular Greeks schools, lessons in Hebrew and in religious instruction by teachers appointed by the Jewish church authorities. Likewise in the Mahometan schools were to be taught the Turkish language and the elements of Persian or Arabic, together with the tenets of the Mahometan religion, by teachers appointed by Mahometans in the different villages. Greek, however, and the other common branches were to be taught by teachers possessing the qualifications demanded for a teacher in the other parts of the Kingdom.

This shows the generosity of the Government in matters of education. In Kerkyra, also, there is an excellent Jewish school which receives aid from the State.

ECCLESIASTICAL SEMINARIES.

Since the church is such an essential part of Greek life and nationality, it is quite natural that provision should be made for the betterment of the intellectual condition of its functionaries. * * *

---

[1] See Θεσμολόγιον, I, pp. 137–139.

One of the first cares of the governor, Kapodistrias, was to establish a seminary on the island of Poros, in the monastery of the Ζωοδόχος Πηγή, or Life-giving Fountain. The school was to be supported from the revenues of the monastery. But the school was not received with favor by the clergy. It was not a school for theology, but merely a school for elementary studies. It was not intended to make priests scholarly, but merely genteel. The school ceased to exist shortly after the death of Kapodistrias.

A greater and more lasting foundation for the good of the church is due to Georgios Rizares. (See Τὰ κατὰ τὴν Ριζάρειον Ἐκκλησιαστικὴν σχολὴν ἀπὸ τῆς συστάσεως αὐτῆς. ἐπιμελείᾳ Νικολάου Ράδου. ἐν Ἀθήναις, 1891.) Georgios Rizares and his brother Manthos were natives of Monodendrion, near Zagori, in Epeiros. In 1806 they began a successful career as merchants in Moscow. They were known from the very beginning of their career as philanthropists. In 1814 they established a Hellenic school in their native town and supported it until the outbreak of the revolution. They gave large sums of money to Alexandros Ypsilantis and to the Philike Hetæria. They gave money for the freeing of captives. They defrayed the expense of the editing of Greek texts, etc. But their most lasting work was the founding of the seminary. Georgios Rizares, in memory of his brother and himself, gave a sum of money large enough to build the institution and to support 20 students. It was dedicated May 15, 1844. King Otho, with his ministers, was present. The bishop of Attika, Metaxas, performed the ceremony. In the following year it opened its doors to students. It is modeled somewhat after the Catholic seminaries of Europe.

Candidates are received into the Rizareion on the following conditions: The applicant must be a citizen of Greece. Ten exceptions, however, are made in favor of students from Zagori. He must be not less than 15 years old and not more than 18. He must be of sound mind and body. He must have completed the course given in the Hellenic schools. He must declare his intention of taking orders; if afterwards he change his intention, he agrees to pay an amount equivalent to what is ordinarily spent on each scholar.

The course of studies given in the Rizareion covers five years. Of these, the four under courses correspond to the courses given in the gymnasia with the addition of such studies as candidates for the priesthood should also pursue. The fifth year is devoted to purely theological studies.

The seminarists live in community life. They study in common halls, eat in a common dining hall, sleep in common dormitories, take recreation together, etc. No student may leave the premises without permission. At a regular hour every afternoon all walk out into the city in a body, or to some suburb. All wear robes of the same pattern—a black cap without peak and with a flat top, a black loose cassock held neatly by a blue girdle, and a black loose long coat with flowing sleeves worn over the cassock.

From the end of June up to the 25th of August the seminarians enjoy vacation from classes, but they are not free to leave the institution and spend their holidays elsewhere except for some strong reason, such as ill health. All are expected to stay at the seminary and to continue to study regularly every day, although their freedom is greater than in the school season.

The priests produced from the Rizareion are destined for the higher ecclesiastical positions. Greece is not able to assume the expense of educating all of her clergy so sumptuously. For the simpler education of other candidates for the priesthood, the Government established in 1856 three other ecclesiastical schools (Ἱερατικαὶ Σχολαί), one in Syros, one in Chalkis, and one in Tripolis.

The Catholics of Greece educate their clergy either in schools within Greece itself, especially in the islands, where most of the Catholics live, or in the theological schools of Rome and Paris. In Greece itself the Catholics have seminaries at Syros, Naxos, Tenos, and elsewhere.

The Protestants in Greece educate their clergy abroad, chiefly in America.

SCHOOLS FOR NEEDY BOYS.[1]

In Greece, as elsewhere, there are many young boys that on account of having to earn their own living, or even to support some one else—a mother, a blind father, or a sister—have no time to attend a day school. In the larger cities provision has been made for these unfortunates. Night schools have been established for their special benefit in Athens, Patras, Kalamata, Zakynthos, and other cities. The Syllogos Parnassos can count among its noble works the practical aid it has given to these schools.

Since Athens is the largest city of Greece, and since it is common for little waifs to come from all the provinces to Athens in order to find occupation, a school of this kind is more necessary in Athens than in the other larger cities. The school for needy boys in Athens is under the protection and direction of the Syllogos Parnassos. It is governed by a board of nine elected by the Syllogos from among its own members. This board appoints the teachers, and in general oversees the management of the school. Text-books and writing material are furnished free to the pupils.

In 1891–92 this school gave instruction to 1,233 pupils, of whom 146 were Athenians, 264 from Megalopolis, 156 from Korinth, and 137 from Makedonia in Turkey.

According to the regulations of the school, no pupils are admitted younger than 5 years, nor older than 20. In this same year, however, by special permission, a few were allowed to enjoy the privileges of the school although older than 20 years. The following table shows the age of the pupils for that year:

Number of pupils from—	
5 to 10 years of age	120
10 to 15 years of age	826
15 to 20 years of age	260
20 to 25 years of age	23
25 to 30 years of age	2
Pupils aged 30 or more years	2
Total	1,233

According to occupation there were—

Day laborers	54
Boys that carried purchases home from the markets	125
House servants	117
Hod carriers and builders' assistants	83
Bootblacks	306

Carpenters, shoemakers, blacksmiths, coppersmiths, etc., were represented also.

These night schools can not be classed with any other schools of the Kingdom. Such branches are taught as may be of most practical assistance to these working boys, namely: Religion, Greek language, mathematics (chiefly arithmetic), Greek history, geography, natural history, writing, and vocal music.

The full course of instruction extends over a period of five years. Instruction is given every week-day evening for two and a half hours. Attendance in these schools can not be regular. In the year 1891–92, 1,233 pupils were enrolled, but the average daily attendance was 381. Of course it must be remembered that not all of the enrollments took place at the beginning of the year, in October, but extended throughout the entire year, at least up to the beginning of May.

At the end of the year mentioned, 269 boys presented themselves for examinations, either to be promoted to a higher class or to receive a testimonial that they had completed the course. Eleven received such testimonials, six with the grade of *ἄριστα*.

On two Sundays of each month the pupils attend church in a body, led by some of the older pupils. Twice a year the director of the school takes care that all go

[1] See *Ὀργανισμος τῆς ἐν Ἀθήναις Σχολῆς τῶν Απόρων Παίδων. ἐν Ἀθήναις*, 1892.

to the sacrament of confession. The health of the pupils is also cared for. They receive free treatment from two physicians appointed from among the members of the syllogos. They also receive free all medicines that these physicians prescribe.

SOCIETIES ESTABLISHED FOR EDUCATIONAL PURPOSES.[1]

Many are the societies (Ἑταιρεῖαι, Σύλλογοι, Λέσχαι) established for the purpose of advancing education. The Greek is by nature a social character, and is ready to join clubs or societies for all kinds of purposes. Some of the more prominent educational societies in Athens are:

The Parnassos, Ὁ *Φιλολογικὸς Σύλλογος Παρνασσός*.

The Byron, Ὁ *Σύλλογος Βύρων*.

The Archæological Society, Ἡ *Ἀρχαιολογικὴ Ἑταιρία*.

The Society for Christian Archæology, Ἡ *Χριστιανικὴ Ἀρχαιολογικὴ Ἑταιρία*.

The Society for the Advancement of Education, Ἡ *Φιλεκπαιδεύτικὴ Ἑταιρία*.

The Society for the Diffusion of Greek Letters, *Σύλλογος πρὸς διάδοσιν τῶν Ἑλληνικῶν Γραμμάτων*.

The Musical and Dramatical Society, *Μουσικὸς καὶ Δραματικὸς Σύλλογος*.

The Historical and Ethnological Society of Greece, Ἱστορικὴ καὶ Ἐθνολογικὴ *Ἑταιρία τῆς Ἑλλάδος*.

The Pharmaceutical Society, Ἡ *ἐν Ἀθήναις Φαρμακευτικὴ Ἑταιρία*.

The Panhellenic Gymnastic Society, Ὁ *Πανελλήνιος Γυμναστικὸς Σύλλογος*.

Ladies' Society for the Advancement of the Education of Women, *Σύλλογος Κυριῶν ὑπὲρ τῆς Γυναικείας Παιδείας*.

The Physicians' Society, Ἰατρικὴ *Ἑταιρία*.

The Society of the Friends of the People, *Ἑταιρία τῶν φίλων τοῦ λαοῦ*.

The Koraes, Ὁ *Κοραῆς*.

The *Φιλεκπαιδευτικὴ Ἑταιρία* was founded through the efforts of Ioannes Kokkones, Georgios Gennadios, and Misael Apostolides. (See Ἡ *Πεντηκονταετηρις τῆς Φιλεκπαιδευτικῆς Ἑταιρίας ἐν Ἀθήναις* in the Ἑσπερος for November 13, 1886. See, also, *Θεσμολόγιον*, I, pp. 122, 123.) It is governed by a constitution formulated in 1836 and remodeled in 1882. It has for its object the advancement of the people by education and culture. It pays especial attention to the education of girls.

It has established young ladies' academies and other schools; has defrayed the expenses of worthy students, especially girls; it has given prizes for best editions of text-books and other books useful for the purposes of education; it has borne the expense of publishing such books; it has supplied needy schools with apparatus, etc.

The society does all this by means of funds made up from the annual fees of members (18 drachmas a year) and the gifts of benefactors and others, the income from the property it owns, the initiation fees of members (6 drachmas), etc.

The Musical and Dramatical Society aims at the founding and sustaining of a national theater. The society was founded in 1871. It interests itself in the work done in the Odeion. The society is yet far from attaining its purpose, yet it will finally bring good results. The theater has always been a favorite institution with the Greeks. And the restoration of the Greek theater to the high rank that it deserves is justly one of the aspirations of the cultivated Hellenes of to-day. It will not be uninteresting to add a short account of the first attempt to produce a Greek play in Athens since the acquisition of freedom. (See the Ἀτλαντίς for December 19, 1896.) Ever since the gaining of freedom the Athenians had enjoyed the pleasures of a theater, but the dramas produced were foreign affairs, in Italian or French, or at best translations into modern Greek from some European language. The first man that determined to put a stop to this sorrowful state of affairs

[1] See Les Syllogues Grecs, par Albert Dumont, in the Annuaire des Études Grecques, 1874, p. 528, and Des Syllogues Grecs et du progrès des études litteraires dans la Grèce de nos jours; par le Marquis de Queux de Saint-Hilaire, in the same Annuaire for 1877, p. 287 ff.

was Alexandros Rizos Rangabes. In 1853, Rangabes, already known as professor, scholar, writer, diplomat, soldier, wrote a drama called the Vigil, Ἡ Παραμονή. He determined to have it produced on the stage. There were no professional actors in Athens, so he had to engage the kind services of amateurs. Rehearsals began, and all Athens was impatient for the proud event of seeing a real Greek play. The play was to be given in the theater of Bonkoura, and the proceeds were to be spent in buying clothing for the Greek soldiers in Peta. However, in the play there were certain passages referring to the action of Austria against the first proclaimers of the struggle for liberty. These passages displeased the Austrian ambassador, who announced that if the play were produced he would immediately depart from Athens. Rangabes then cut out the offensive passages, and after a long delay he received permission to proceed. King Otho and Queen Amelia were to be present at the performance, but on the morning of the evening on which the play was to be given there came a message to Athens that the Greek garrison at Peta had been attacked by the Turks and fallen in slaughter. So great was the gloom that spread over Athens that no one thought of the play, and the Vigil was never produced.

But, nevertheless, other Greeks, and Rangabes himself, soon had the satisfaction of seeing their Greek plays produced in Athens.

Popular dramas at present are Οἱ Μυλωνάδες, The Millers, a comedy; Ἡ Κατάρα τῆς Μάνας, The Mother's Curse; Ἡ Μήδεια, Ἡ Φαῖστα, tragedies.

Old classic dramas, such as the Oedipous Tyrannos, The Philoktetes, the Antigone, are produced from time to time.

The Society of the Friends of the People (Ἡ Ἑταιρια τῶν Φιλων τοῦ Λαοῦ) seeks by means of public and popular courses of lectures to instil useful and entertaining knowledge of a patriotic and elevating kind into the hearts of the workingmen. These lectures are given in the evening, when such men are free. Each year's course consists of about 125 lectures. The lectures are arranged in groups, each group forming a connected series of instruction. Popular topics are the history of Greece, and instruction in the natural sciences. Some of the best teachers of Athens find time to belong to this association, and lend their aid to the cause of educating the working classes.

THE HISTORICAL AND ETHNOLOGICAL SOCIETY.

(Ἡ Ἱστορικὴ καὶ Ἐθνολογικὴ Ἑταιρία.)

The Historical and Ethnological Society was founded in 1882. In the following year it began to publish a valuable periodical containing the results of its researches. In the prologue to the first number Mr. Timoleon Philemon, the first president of the society, explains the reason why the society came into existence, and the necessity of its continuing to exist. The object of the society is to study the life of the Greeks from the time when they ceased to be an independent people down to the time when they again regained their freedom. The society in its studies excludes no phase of life whatsoever. Art, literature, morals, social relations, superstitions, religion, politics, customs, etc., are all to be searched for in order to discover the true history of the people, and to show scientifically the exact relation of the present Greeks to those of all the past.

The society possesses a museum, in which it keeps all such relics and mementos of the ages covered by the studies of the society as it succeeds in collecting. This collection includes garments of men and women, medals, coins, seals, musical instruments, manuscripts, books, letters, bulls, etc.

THE ARCHÆOLOGICAL SOCIETY.

(Ἡ Ἀρχαιολογικὴ Ἑταιρία.)

The Archæological Society was founded in 1837 through the zeal and determination of Kyriakos S. Pittakes and Alexandros Rizos Rangabes. With limited means at its disposal this society has accomplished wonders. Excavations have been scien-

tifically and successfully carried on at many different places, notably at Athens (on the Akropolis), Elevsis, Epidavros, Tanagra, Mykenæ, Lykosoura, Sparta, and Rhamnous.

Since its foundation the society has published the Ἀρχαιολογικὴ Ἐφημερίς as its organ. The society twice almost ceased to exist on account of lack of funds, and accordingly the publication of the journal was twice interrupted. It is now published quarterly in splendid style and with scientific accuracy. Beside the Ephemeris, the society also publishes its Πρακτικά from time to time, in which the reports of the various officials of the society make known the progress of the work done under their special charge.

THE SOCIETY FOR CHRISTIAN ARCHÆOLOGY.

This society was founded to supplement the work of the excellent Archæological Society; for the Archæological Society, completely wrapped up in the study of the older monuments, not only found no time to devote to the remains of later times, but even often showed positive neglect or even contempt for the monuments of mediæval Christianity, monuments which have an absolute value in the history and fate of the Greek people. Often, in order to facilitate research for classic finds, Christian monuments were unnecessarily sacrificed. To correct this abuse the Society of Christian Archæology was founded and has its place. The society has much work before it. It intends to study and care for edifices of Byzantine architecture, mosaics, inscriptions, frescos, coins, medals, manuscripts, etc. As yet, however, through lack of means, this society has done comparatively little, compared with its older classic sister, the Ἀρχαιολογικὴ Ἑταιρία. The Marquis of Bute has been one of its most devoted friends.

FOREIGN ARCHÆOLOGICAL SCHOOLS IN ATHENS.

These schools really do not need to be mentioned here, as being outside of the system of schools intended primarily for Greeks. They are supported from abroad, are conducted by foreigners, were established by foreigners, and are intended for foreigners. Yet their work is so excellent, and is so much in line and in sympathy with the work of the Greek archæological societies and is open in a certain way to Greeks, at least as regards use of libraries and other collections, that they should not be left unmentioned even here.

There are now four such schools in Athens. The French and German schools are supported by their respective Governments; the British school receives partial support from the Government; the American school is supported entirely by the Archæological Institution of America and by private contributions.

These schools are simply groups of young investigators under the guidance of older specialists.

THE FRENCH INSTITUTE.

The French school was founded in 1846 under the title of the École Française d'Athènes. Since 1876 it is known as the Institut de Correspondance Hellénique. The school devotes itself chiefly to archæological studies. It has carried on excavations with eminent success at various places—e. g., at Delos. At present the French school is conducting excavations at Delphi. The work is being done with characteristic thoroughness. Here it is that the fragments of hymns to Apollo, with ancient musical notation, were discovered. In 1890 the French Government appropriated 500,000 francs for the inaugurating and carrying on of these excavations.

The school is under the guidance of a director appointed by the Government. He directs the work of the school as a whole and also gives advice and assistance to the individual members. The members are six in number. No one is eligible for

membership unless he be a professor extraordinary in the Academy. Each member remains at Athens for a term of three years. Some of the best French Hellenists, philologians as well as archæologists, have been members of this school.

Up to the year 1877 the work of the school and its results were made known through different periodicals, especially the Revue Archéologique. But since that year the school has published a monthly periodical of its own, the Bulletin de Correspondance Hellénique. To this publication there has been added, since 1881, the Bibliothèque des Écoles d'Athènes et de Rome.

THE GERMAN ARCHÆOLOGICAL INSTITUTE.[1]

The German Archæological Institute at Athens was modeled after its elder sister, the institute at Rome. In 1874 the Roman school, then known as the Royal Prussian Archæological Institute, was changed into the Imperial German Archæological Institute, and in this same year a branch school was established in Athens. The branch, however, grew so rapidly in importance that in 1887 it was raised to equal rank with the institute at Rome, and since that year is known as the Athenische Abtheilung des Kaiserlich Deutschen Archæologischen Instituts.

The institute is now located in a fine edifice built by Schliemann expressly for the purpose. It is under the management of two secretaries. These are now Prof. Wilhelm Dörpfeld and Dr. Paul Wolters. Five stipendiaries are kept in the institute at Athens. To be eligible as stipendiary one must have already received the doctorate.

The library of the institute, an excellent one for archæological work, took its beginning from the books collected by Arthur von Velsen, who died in Athens in 1861 as secretary of the Prussian embassy.

The magnificent work of the institute is evident in its publication, the Mittheilungen des Kaiserlich Deutschen Archæologischen Instituts, Athenische Abtheilung. The publication was begun in 1876, and appears as a quarterly. The language of the publication is mostly German. Occasionally, however, an article contributed by some one of other nationality appears in the writer's own vernacular, e. g., Greek or English.

THE BRITISH SCHOOL.

This school was founded in 1886. It has been supported by the universities of Cambridge and Oxford and the Society for the Promotion of Hellenic Studies. The Government now contributes something toward the maintenance of the school. Its chief organ is the Journal of Hellenic Studies.

The school is under the direction of a committee, which meets in London, consisting of Hellenists and art lovers. In Athens the management is in the hands of a director.

The library of the school is a very good one.

Successful excavations have been carried on by the school at different places in Greece and also in the island of Kypros.

THE AMERICAN SCHOOL OF CLASSICAL STUDIES.

Of all these archæological schools at Athens the American School of Classical Studies is dearest to us. From the following account it will be seen that its work has been such as to make us feel proud of it and its projectors and managers.

It was founded by the Archæological Institute of America, and is under control

THE AMERICAN SCHOOL OF CLASSICAL STUDIES.

Of all these archæological schools at Athens the American School of Classical Studies is dearest to us. From the following account it will be seen that its work has been such as to make us feel proud of it and its projectors and managers.

It was founded by the Archæological Institute of America, and is under control

---

[1] See Michaelis, Geschichte des Deutschen Archæologischen Instituts, 1828–1879. Berlin, 1879, pp. 164 ff.

A. Michaelis, Die Aufgaben und Ziele des Kaiserlich Deutschen Archæologischen Instituts, in the Preussische Jahrbücher, Vol. 63, 21–51, and a translation of the above by Alice Gardner, "The Imperial German Archæological Institute," in the Journal of Hellenic Studies, x, pp. 190–215.

of that institution. Soon after the founding of the Archæological Institute, in 1879, its members began to feel that on account of the peculiar importance of making research in the old classic lands special measures should be taken to permanently establish some means of carrying out such investigations. The land thus first favored was Greece.

Through the cooperation of nine of the first colleges of America, each of which promised to contribute $250 annually for ten years, the school at Athens was established, and in the autumn of 1882 Mr. W. W. Goodwin, professor of Greek at Harvard University, went to Athens as the first director of the new school.

The founders of the school did not limit its scope to archæology, foreseeing that, although most of the best work done would be in archæology, yet many a young college graduate might profit much by a year's philological or historical training there in the very center of old Hellenic life.

After a few years of existence the school became prosperous enough to warrant the erection of a house adapted to the needs of the school. The Greek Government, with characteristic generosity, donated the grounds, and in 1888 the fine new building was ready for occupation.

Since that time American archæological or classical students and scholars visiting Athens have found at the foot of the southeast slope of Lykabettos an institution that they may take just pride in. They find there an excellent library, adapted especially for the study of the art, topography, epigraphy, language, and literature of Ancient Greece. They find a small knot of young, enthusiastic men, who find highest delight in delving, now by book and now by spade, into the marvelous life of that people which has been the civilizers of the world.

The school sends out two sets of publications—the Annual Reports and the Papers of the American School of Classical Studies. The American Journal of Archæology and of the Fine Arts also publishes much of the work of the school.

The management of the school was, during the first six years of its existence, in the hands of a director sent out annually from one of the cooperating colleges. Now, however, the director is appointed for a period of five years. The present director, Prof. Rufus B. Richardson, whose term of five years would have expired this year, has been reappointed. Thus the school falls under the direction of a man who, by continuous residence in Greece and by unbroken application to scientific work there, will bring about the best results that are possible. Beside the director there are two other officers, a professor of literature and a secretary. These are appointed annually. The professor of literature for the year beginning October, 1897, is Professor Emerson, of Cornell.

Membership in the school is granted to graduates of cooperating colleges and to all other American students that are deemed to be sufficiently prepared for the work done in the school.

The Americans have made important excavations at Sikyon, Thorikos, Ikaria in Attika, at the Heraeon near Argos, at Eretria in Evboea, and elsewhere.

GREEK SCHOOLS OUTSIDE OF GREECE.[1]

Greek schools outside of the Greek Kingdom have been made to conform as nearly as possible with the schools within the Kingdom, so that in the Turkish Empire, for instance, we find Greek demotic and Hellenic schools and gymnasia of the same rank as those of Greece. Many of these schools are older than the war of independence.

The teachers in these schools of Grecia Irredenta have most of them studied at Athens, whither they are sent at the expense of communities, or as beneficiaries of scholarships established by patriot Greeks. Young Greeks of Turkey, also, study in the universities of Europe, supported by such scholarships.

Just as in free Greece attention is being paid to the education of girls, so also in the Greek communities of Turkey is the same being done. Young ladies' academies,

[1] See Ἡ Πύλη καὶ ἡ ἐν Τουρκίᾳ Ἑλληνιμὴ Παιδεία (in the Ακρόπολις for June 23, 1884).

Παρθεναγωγεῖα, have been established in the larger cities by rich benefactors. Of these the Zappeion at Constantinopol may be mentioned. *Το Ζάππειον Παρθεναγωγεῖον ἐν Κωνσταντινουπόλει καὶ ὁ ἱδρυτὴς αὐτοῦ*, in the *Ἔσπερος*, VII, pp. 182 ff.

WRITERS ON PEDAGOGY.

Although few scholars among the modern Greeks have devoted their time exclusively to a study of pedagogics, yet not a little work has been done in this science.

In the year 1820 a well-known and successful scholarch, K. Koumas, who taught in Smyrna, published at the end of his work on philosophy a theoretical treatise on pædagogy.

Adamantios Koraes, about whom more will be said in the chapter on the language question, never taught in any kind of school, and yet he must be regarded as knowing well the theory of teaching. His views on pedagogy are scattered throughout his various writings. He strongly advocated the introduction of European methods into the schools of the East, and at different times used his influence in trying to induce wealthy Greeks to send young men to Switzerland and other places in order to learn the new educational systems that at that time were being much talked about.

The first practical book on pedagogics published in free Greece was the *Ὁδηγός* of Kokkones. This *Ὁδηγος*, or Teachers' Guide, was merely a translation from the French. It has several times been revised and republished, and has never ceased to be one of the best known books to every teacher in Greece.

In 1839 a journal called *Ὁ Παιδαγωγός* began to appear. It was intended chiefly for teachers, and contained, with other matter, a good amount of valuable pedagogical material. After a short time, however, the journal ceased to exist.

In 1857 there appeared another work that can lay claim to being classed with pedagogical literature. This was the *Ὁδηγός τῶν Φοιτητῶν*, or Students' Guide, by Professor Rousopoulos, of the university. It contains exhortations to scientific education, a scientific method of studying, and the laws of the university.

In 1865 G. G. Papadopoulos published a Practical Guide for Teachers in the Demotic Schools, *Δοκίμιον Πρακτικῶν Ὁδηγιῶν πρὸς τοὺς Διδασκάλους τῶν Δημοτικῶν Σχολείων. ἐν Ἀθήναις.*

In 1878 the *Διδασκαλικὸς Σύλλογος*, an organized society of teachers, began to publish a pædagogical journal called *Πλάτων*. It was continued until 1890, appearing once a month during that time. The intention of the society in publishing and supporting this journal was to better the condition of teachers in the preparatory and middle schools, and to better the schools themselves by diffusing among the teachers a more scientific knowledge of the methods of teaching. Among the many good articles that appeared in this journal, I make especial mention of a series of articles written by Mr. Blasios G. Skordeles, entitled *Ἡμερολόγιον Δημοδιδασκάλου, ἤτοι ἡ Παιδαγωγία ἐν τῇ Πράξει*, "A Teacher's Diary, or Pedagogy in Practice." Mr. Skordeles, in this diary, shows how a teacher may meet and solve the various perplexing problems he meets with in the performance of his daily routine of duty. The diary has been also published in book form.

During the last few years a periodical has been published, called *Ἡ Διάπλασις τῶν Παίδων*, Training of Children. It treats in a practical way of many questions connected with elementary education.

Another important book is by S. M. Olympios, treating of how to teach children to express their ideas both orally and in writing. A second edition of this excellent work came out in 1886 (cf. *Ἑβδομάς* for August 10, 1886, p. 30). The title of the book is *Ἐγχειρίδιον Προφορικῶν καὶ Γραπτῶν Ἐκθέσεων Ἰδεῶν· ὑπὸ Σ. Μ. Ὀλυμπίου, πρὸς χρῆσιν τῶν Δημοτικῶν καὶ Ἀστικῶν Σχολείων.*

The Herbartian system has found a warm advocate in Mr. M. Bratsanos. He has written a Theoretical and Practical Guide for Demotic Schools according to Herbartian Priciples, *Θεωρητικὸς καὶ Πρακτικὸς Ὁδηγὸς τοῦ Δημοτικοῦ Σχολείου κατὰ τὰς ἀρχὰς τοῦ Ἑρβάρτου.* The work is mentioned in the *Ἑβδομας* for August 10, 1886, page 383.

An exceptionally valuable publication is Pantazides' Pedagogics, *Γυμνασιακὴ Παιδαγωγικὴ προς Χρῆσιν τῶν τε Φοιτητῶν τῆς Φιλολογίας καὶ Πάντων 'εν γένει τῶν Διδασκάλων τῆς Μ'σης Εκπαιδεύσεως. εν Αθήναις*, 1889. Professor Pantazides has taught this science for years in the university.

A proof of how seriously interested the Greeks are in the various theories of education is shown by the fact that, although money is very scarce with them, they nevertheless from time to time attempt to devise some means of sending young men to Europe to make special study of pedagogics. Prizes are also given for best treatises on pedagogical subjects. For instance, in 1883 a prize of 2,000 drachmas, the *Μαραθειος αγών*, was offered for the best work on this subject. (See *Πλάτων*, vol. IV, pp. 106, 107.)

TEXT-BOOKS.

Before a text-book may be introduced into the schools it must be approved of by a committee appointed for that purpose by the minister of education. This committee decides upon the suitableness of all text-books, and also determines the maximum price at which the book is to be sold. The law excluding all unapproved books is from November 24, 1867. Article 8 of that law states that every teacher in a public school who violates this law will be subject to a fine of from 50 to 150 drachmas, and must refund to the pupils all money that they may have spent at his advice for unapproved books. In case of a second offense he is dismissed. A teacher in a private school, if guilty of the same offense, loses for one year his license to teach. (See *Θεσμολόγιον*, II, p. 197, note.)

Certain books, such as the original texts of Greek and Latin classic authors, are not subject to this regulation. No text-book for religious instruction is admitted to competition unless it bear the approval of the holy synod.

Every four years books are submitted for approval. Only one book of each kind is approved. The approval of a new book cancels the previous approval of other books.

Just as the system of schools is an imitation of the European system, so also is it common for European text-books to serve as models for the text-books used in Greek schools. This has naturally led to the mere translation of many European text-books into Greek. The period of mere translation, however, is fortunately passing away for most sciences, and the home products are found to be, if not always quite so modern in scientific qualities, at least better adapted to circumstances.

EDUCATION FREE.

The democratic principles of the Greeks make them averse to all favors that might be exclusively available to a special class of citizens. This principle makes them object to having any part of education purchasable by those only who have means. They think that no one should be debarred from any school, even the university, by being unable to pay for his tuition, and this the more so since the Greeks look on education as having a "national" purpose. In his view, education of the Greeks advances the cause of Hellenism. Accordingly no Greek should be barred out from this field by poverty; and all education, from the lowest class in the demotic school up to the highest in the university and the polytechneion, is, by the popular interpretation of the constitution, to be given free of cost.

However, during these last years, debt has pressed so heavily on the brave little Kingdom that it has been found necessary to raise taxes even from schools. And in virtue of a law of 1892 (*νόμος* BND of that year), each student pays a tax by writing out his application for matriculation, etc., on stamped paper, so that now the student of the Hellenic school pays about 25, the student of the gymnasium 50, and the university student 100 to 150 drachmas a year. This tax has met with opposition, especially from the students of the university, on the ground that it is unconstitutional.

THE PRINTING PRESS IN GREECE.

After the summary disposal of the printing establishment set up in Constantinopol by Kyrillos Loukaris we hear of no other attempt to print anything among the Greeks of the Empire until the year 1820. In that year Firmin Didot, who had returned to Paris enchanted with what he had learned about the Greeks during his stay in Kydonia and other parts of the East, sent two printing presses, with type and other necessaries, one to the school at Kydonia, which he loved so intensely, and the other to the town of Chios. Chios received this gift through the influence of Koraes, who was at that time in Paris and was an intimate friend of Didot. The busy Greeks immediately began to issue pamphlets and booklets from both of these presses, but their joy was short-lived. The Turks destroyed the press at Kydonia in the year 1821, when they burned the village; they destroyed the one at Chios in 1822, when they perpetrated their awful butcheries of that year. (For a description of these massacres read Loukis Laras, by Demetrios Bikelas.)

During the war of liberation presses were set up at various places, notably at Missolonghi, at Navplion, etc. Journals and not books were printed from these presses.

The first books printed in Athens came from the press of Andreas Koromelas, who had gone to Paris, and there in the establishment of Firmin Didot learned the business of printing. He came back to Athens, and in the year 1835 established a printing house. Letters in Greece owe much to him.

JOURNALISM IN GREECE.

Journalism is so closely connected with modern culture and education that it is impossible to omit it from the present treatise. So a brief sketch of Greek journalism from its first beginnings down to the present day will not be out of place. (See La Presse dans la Grèce Moderne depuis l'indépendance jusqu'en 1871, par le Marquis de Queux de Saint-Hilaire, in the Annuaire des Études Grecques, 1871, pp. 147 ff. See also Το Ιωβελαῖον τῆς Αμαλθείας, in the Εβδομάς for July 30, 1888.)

After the fall of Venice, in 1797, Vienna became the literary center of learned Greeks in Europe. Here it was that the first Greek journal made its appearance. It began in 1793, being edited by the brothers Poulion. It did not last long. The last number appeared on June 28, of the same year.

In 1811 another Greek paper was started in Vienna, the Εἰδήσεις διὰ τὰ Ἀνατολικὰ Μέρη, or News for Eastern Parts, which was followed in the next year by the Ελληνικὸς Τηλέγραφος. These short-lived attempts were overshadowed in importance by the scholarly and influential Λόγιος Ἑρμῆς, begun in 1811 by Anthimos Gazes. It continued to exist and do good until the very eve of the war for independence, which it did much to bring about. It ceased in 1821.

Paris also at this time was the rendezvous of a number of learned Greeks. Long is the list of Greek journals that came into brief existence in Paris. The Ἀθηνᾶ was founded in 1818, the Μουσαῖον in 1819, and the Μέλισσα in the same year.

After Greece became free the chief raison d'ètre of the editing of Greek papers in foreign countries passed away. However, other reasons arose making it important that some such papers continue to exist. Accordingly, since that time Greek journals and periodicals have been published for longer or shorter periods in various places of Europe. In Paris we find the Πολύγλωττος and the Μύρια Ὅσα, in 1868, and the Ἐθνικὴ Ἐπιθεώρησις in 1869. In Great Britain was published the Βρεττανικὸς Ἀστήρ, by Stephanos Xenos; in Leipzig the Κλειώ, and in Triest the Νέα Ημέρα. This last paper was founded in 1855. It still flourishes as a weekly under the masterful editorship of the scholar and litterateur, Alexandros Byzantios.

Even in Turkey the Greeks were finally allowed to have their newspapers. Perhaps the first such was the Ὀθωμανικὸς Μηνύτωρ of Constantinopol. In 1838, Constantine Rhodes, a warm Philhellene, established at Smyrna the Αμάλθεια, which still exists and does good.

Within the territory now occupied by free Greece the first paper published was the Αστυκη, which began in Keryka in the year 1802. It was short-lived.

While Missolonghi was being besieged by the Turks, the first paper printed under what may be called free Greek government made its appearance. It was edited by the Swiss Philhellene Mayer under the title of Χρονικὰ Ελληνικά. It was championed and supported by Stanhope, who had come from England to Greece for the express purpose of starting newspapers, schools, etc. The Χρονικα began to appear in January of 1824. It was a biweekly. It is now valuable for a source of information for facts concerning the war, and on this account has been reprinted. It was in this paper that Trikoupes's famous funeral discourse over the remains of Lord Byron was published.

Before the appearance of the Χρονικά of Missolonghi, matter had been printed in Greece, but no newspaper seems to have been published. Prior to this time there was a press at Kalamata under the control of Ypsilantis, and another at Korinth, used for the printing of proclamations, etc. (See Stanhope's letter XVII in work cited above.)

Later in the same year, 1824, another paper came out in Greece, the Φίλος τοῦ Νόμου, published at Hydra. The editor was an Italian named Chiappa. Chiappa's outfit consisted of not much more than a small quantity of tpye. He printed the paper by inking the type by hand, and then taking the impression as printers take proof impressions. He was writer, editor, typesetter, proof reader, pressman—all.

In 1825 the Γενικὴ Εφημερις τῆς Ελλάδος was begun as the organ of the Government. At least it was the organ of Kapodistrias. Since 1835 the Εφημερὶς τῆς Κυβερνήσεως has been the official organ of the Government. During the reign of Otho it was accompanied by an official edition in German for the numerous Bavarians in Otho's service.

From the small beginnings described above the press in Greece grew with marvelous rapidity. In the year 1867 Greece sent to the World's Exposition a copy of all the papers published in the country. They were almost a hundred in number. Since that time the number has gone on constantly increasing. At present newspapers are published not only in Athens, Patras, Peiræus, and other large cities, but almost every town of any consequence has its paper, at least a weekly. These papers are small in size, but not in aspirations.

In Athens the principal papers to-day are the Εφημερίς, the Ακρόπολις, the Νέα Εφημερίς, the Παλιγγενεσια, the Πρωία, and the Νεολόγος Κωνσταντινουπόλεως. This last paper was until recently published in Constantinopol. But as a result of the late war the editor, S. I. Boutyras, thought that the proper place for a journal that wished to express its thoughts freely was not in the city of the Crescent.

Greece has also a number of periodicals. Among the best are the Παρνασσός, which is the organ of the Parnassus Club, and the Αθηνᾶ. The various sciences are represented by some special periodicals.

ILLITERACY AMONG THE MASSES.[1]

The modern Greek, like his classic ancestors, is by nature a searcher and inquirer. He is social, and likes to dispute and discuss. He does not resort to books for knowledge or entertainment as frequently as do the colder men of northern climes. It follows that the average Greek is not such a devourer of written knowledge as we would like to have him be. The percentage of downright illiteracy is perhaps greater than one would wish to see. Yet it is among the older men and among the women that illiteracy chiefly prevails. The older men are to be excused, because when they were boys Greece was still very young and had not yet developed her system of schools. The women owe their illiteracy to the fact that custom relegated them to household duties, and for housekeeping in Greece book knowledge

[1] See Περὶ βιβλίων καὶ τῆς Ἐξεως τοῦ ἀναγιγνώσκειν ὑπὸ Δημητρίου Βικέλα, in his Διαλέξεις καὶ Ἀναμνήσεις· ἐν Ἀθήναις 1893.

has not been in demand. We see in another chapter how the women of Greece are now beginning to vindicate their intellectual qualities in the field of higher education, as they vindicated themselves long ago in patriotic courage. Among the younger women the percentage of illiteracy is greater than among the younger men. Of the younger men indeed very few are unable to read. According to the statistics of 1885, two-thirds of the entire population were yet unable to read.

Since the Greek is a politician by nature, he loves to read political news more than any other kind. This explains the extraordinary number of daily journals published in the Kingdom. Light literature is read chiefly by the ladies. They like the European novels, which are translated for them in abundance. When the man reads a novel, he prefers one whose plot is connected with the history and traditions of his own country. The modern writers of light literature in Greece are sufficiently numerous, and have produced many a readable book.

THE LANGUAGE QUESTION.

The question of education in Greece can not be completely handled without devoting a chapter to their language. This might be true of education in any country, but it is especially true for Greece. In Greece, as in every country that possesses a literature, there exists a difference between the literary language and the spoken language. Again, every language spoken throughout extensive territory has a number of local varieties or dialects, and every literary language has a variety of forms, according as the writer uses a language more or less different from the spoken dialects.

In Greece there exists a clique of scholars who cry out that the literary language should be identical with the spoken. One of the prominent men of this school at present is Professor Psycharis, teacher of Greek in Paris. Psycharis is a scholar of note. He has written a number of excellent treatises dealing with the language question; but what attracted most attention was his book, Το Ταξιδι μου. He wrote it in what he regards as the correct language for a literary work. The book produces the same impression on a modern Greek as it would on an American if done into such English as would be a mixture of Louisiana plantation dialect with the language of the slums of New York enriched by stray words and phrases of New England Yankee dialect and vigorous phrases of the western cowboy together with a large amount of other slang from all parts of the English-speaking world. But not all the advocates of the "people's language" are as extreme as is Psycharis.

The followers of the opposite school write in a simplified and modernized form of the old Hellenic or Κοινή. This is the traditional literary language with such as have not sought to write in some form of ancient Greek. The writers of this language are not disturbed by the fact that there is a difference between their language and that of the illiterate. Many of them know German and English and Italian, and they see that in these languages there exists a like difference, and as great. Nearly all scientific books, text-books, journals, etc., are published in the language of these purists. Some poets, novelists, and other such writers often use the demotic for the same good reasons that poets and novelists do in other countries. But in Greece the evil is that these poets and novelists sometimes think that every good Greek should learn to speak their dialect.

The language of the purists, the Katharevousa, as it is called, is not of one rigid kind merely, but possesses many varieties from the Attic accuracy of a Kontos, the suppler grace of a Lampros, or a Paganelles, down to the looseness of a Rhoides. Of these varieties, however, each heartily condemns all the others. The writers mentioned here are all writers of prose. The same variety of language, however, exists among the poets that write in Katharevousa.

As early as the fifteenth century the dispute over what ought to be the literary language of the Greeks began. The difference between the literary and the spoken language had been growing greater century after century, because the writers per-

sisted in trying to write in ancient Greek. We all know that as soon as a country has a literature behind it worthy of study, just so soon is a difference created between the language of literature and that of ordinary life. How far the language of ordinary life should mold that of literature, and how far the language of literature should mold the language of ordinary life is a matter that depends on different circumstances. Of course to-day when the written page is so potent and universal a medium, and when every one is under the influence of the written word, it is clear that the written word will triumph over the spoken form in many cases where in other times the spoken word would have easily prevailed; but of course written learning will never keep free from influence from below.

Well then, the ever widening breach between the written language and the spoken dialects became a matter of serious discussion in the fifteenth century. One of the first determined defenders of the value of the people's language was the learned Nikolaos Sophianos, who flourished in the first half of the sixteenth century. He wrote a grammar of the common language, in the preface of which he says, addressing the Cardinal John, Prince of Lorraine, "Dum igitur hanc nostram quam vocant vulgarem linguam cum illa antiquorum confero Platonis Demosthenis Xenophontis et aliorum * * * reperi multis in rebus hanc nostram vetere illa minime inferiorem esse. Constat nempe verbis puris per manus (?) ab antiquissimo sæculo traditis et brevitate quadam mirabili tum regulis certis et paucis."

This same Sophianos wrote or translated other works, using the common dialect. At that time the demotic found but few such determined admirers as was he.

The growing determination of the Greeks to again become a free people had its influence on the language question. As a matter of fact, there existed no common and universal spoken language, if we except the language of the purists. The inhabitants of each separate valley had a peculiar way of speaking. But whenever one wrote something for all Greeks to read, what was to be done? Some believed that the classic language should be the common medium of communication among scholars; others preferred the ecclesiastical Greek; others more sensibly looked for some medium of communication that would be nearer to the language of the people. Those who wrote without knowing in what form they were writing, but followed their better thoughts, usually wrote in a form of the Katharevousa.

Each opinion had its warm defenders. The strife among them grew bitter and personal. At the beginning of the present century we find, for example, Koraes (see *Ἀδαμάντιος Κοραὴς ὑπὸ Διονυσίου Θεριανοῦ*) and his followers advocating that the written language be made up of such elements as are common to most of the dialects; that it be enriched not from other modern languages nor from local dialects of modern Greek but from the classic language, and that the classic language be used as a model as far as could be consistently done.

Koraes was attacked from all sides, but yet he had a larger following than any of his opponents. He was too fond of the vulgar language to suit Panagiotes Kodrikas, and too much inclined to be influenced by the ancient to suit Daniel Philippides. Nor could he find favor with the good-dispositioned Neophytos Doukas, who wished the learned to write in the language of the church as used in official letters, etc., in the patriarchate of Constantinopol, and in the writings of the church fathers and in the sacred liturgy.

But in the midst of this quarrelling the war for freedom broke out. It served as a cloak to smother the flames of dispute. Patriotism was stronger than love for intellectual polemics. But before the boom of war came Koraes had practically triumphed. He has since been regarded as the molder of the present Katharevousa.

Certain writers or scribblers attribute their lack of success in producing masterpieces to the imperfection of the medium they are compelled to write in. These vehemently advocate a return to the language of the peasants. They are not sufficiently numerous or influential to do great harm, but still they can produce uneasiness by their boisterous complainings. Sometimes their attempts are amusing, when, for example, after writing a poem or story in their favorite lingo, they find it necessary

to add annotations in order that the people may understand; and these annotations are always in the Katharevousa.

The various dialects are in many respects very beautiful. These dialects tell the history of the people. They are replete with myth and tradition and history. Although no one of them is worthy of being made the literary language of the entire Greek people, yet each and every one of them has a high philological value.

In order to encourage the study of these dialects, prizes have been offered at different times for the best collections of words, phrases, stories, ballads, etc., from among the people.

A few years ago a society called the Koraes was founded for the special purpose of encouraging research into the popular language. It published a periodical containing rich material for further study in this line. In Germany, Dr. Albert Thumb, of Freiburg, is devoting himself to this study, and Professor Krumbacher, of Munich, who publishes the Byzantinische Zeitschrift, and has written a Geschichte der Byzantinischen Litteratur, from the fact that he makes a specialty of Byzantine matters, is naturally highly interested in the study of the modern dialects.

Much has also been done in the same line by the Philologikos Syllogos of Constantinopol in encouraging the collecting of "Living Memories," *Ζῶντα Μνημεῖα* of the various dialects, and publishing the same in its periodical the *Ἑλληνικὸς Φιλολογικὸς Σύλλογος τῆς Κωνσταντινουπόλεως*.

But the man who is now doing most for the proper study of these beautiful and attractive dialects is Dr. Georgios Hatzidakis, a Kretan. He is professor of comparative philology in the university. After having distinguished himself as a student in the Greek University, he went to Germany and studied comparative philology there. In his numerous writings, some of which are in Greek and others in German, he teaches that the only language that can possibly remain the universal language of Greece is the Katharevousa, but that the Katharevousa should be enriched not only from the ancient language, but also from the modern dialects. He strongly urges the serious study of the dialects in order that their true value may become known, and that they may be properly used for the enriching of the literary language.

Hatzidakis is an admirer of Koraes, and was one of the charter members, if not the founder, of the Koraes Society mentioned above. Indeed it is mostly due to Koraes's influence and correct advice that the Katharevousa has won its way and gained its place to stay.

Koraes was born in Smyrna in 1748. From childhood up he hungered after letters. In his autobiography he tells of how his father, a poor man, encouraged his desire to study. If the young Koraes asked his father for a new garment, his father would hesitate, but whenever he asked for a new book, or for an instructor, his father immediately made provision. But nevertheless he was 34 years old before he could devote himself thoroughly to letters. Then he studied medicine at Montpellier. In 1788 he went to Paris and began to write. His opinions on the language question are scattered throughout his various writings, which a few years ago were published in a new and complete edition, *Τὰ Ἅπαντα τοῦ Κοραῆ*.

ATTIC GRAMMAR.

It has already been stated that the practice still is to teach all the grammatical knowledge given to the students through the medium of the Attic grammar. This does not imply that the teachers expect to hear the pupils use in conversation or find them employing in writing all the forms peculiar to the Attic. They merely look on grammar as a science, and regard the Attic grammar as affording best material for the learning of that science.

There are scholars, however, who hold that the Katharevousa should be taught directly through its own grammar. And, since 1884, the teaching of modern Greek grammar has been on the programmes of the gymnasia. Grammars of this kind have been prepared, but not by the most competent men. Most men of the first rank seem to think that such an innovation is not yet needed. Pantazides, however, thinks

that such grammar should be the basis of the teaching in the schools, but is unable to say how far such grammars should depart from Atticism. Naturally, however, such grammars will gradually come to be universally approved.

MODERN LANGUAGES.

No provision whatsoever is made for the teaching of the other modern languages, French, German, English, etc., in the university. The importance of the classical languages and literatures seems to so overshadow the usefulness of the later languages as to make them entirely neglected as objects of university study. The position of language teacher in a gymnasion does not demand that the incumbent be a philologian, and as a matter of fact such positions are often filled by Europeans who merely teach how to read and converse in these languages. No provision is made for teaching them in a philological way. The remunerative allurements that would cause a young Greek to study the philology of some other language instead of his native Greek philology, are very weak.

The Greeks easily learn to converse in modern languages. Many men and women of moderate education speak French and Italian and German and English. This knowledge and facility is not due to any university training. Strangely enough the only modern languages, so far as I know, ever taught in the university were English and Turkish. English was taught by Professor Masson, who translated Winer's Greek Grammar of the New Testament into English, but he did not teach long. After the Turkish language had been taught for a few years it was found that no one studied it philologically; and those who wished to learn to merely speak and write it could succeed better by taking their instruction from an ordinary teacher of languages.

Table showing the number of students annually attending courses at the university from its opening down to the present time—1837–1897.

[For the years 1837-1887 this table is taken from Pantazides' Χρονικόν. Numerals marked with a (*) denote not the sum total of students enrolled, but only the new enrollments for that year.]

Year.	Theology.	Philosophy.	Law.	Medicine.	Pharmacy.	Total.
1837–38	8	18	22	4	.....	52
1838–39	*2	*15	*10	*10	.....	*43

Present Teaching Faculty in the National University.

THEOLOGY.

Professors.—Anastasios Diomedes Kyriakos, church history and symbolics; Zekos Roses, dogmatic theology and Christian morals; Prokopios Oekonomides, archimandrite, patrology, history of dogma, and apologetics; Emmanuel Zolotas, New Testament and encyclopedia of theology.

Docents.—Spyridon P. Soungras, apologetics; Ignatios Moschakes, church oratory and homiletics; Ioannes E. Mesoloras, symbolics and liturgy; Georgios Derbos, church history.

LAW.

Professors.—Nikolaos Damaskenos, commercial law; Konstantinos N. Kostes, penal law; Stephanos Streit, international, public, and private law; Demetrios Theophanopoulos, Roman law; Zenophon I. Psaras, civil process (*τῆς Πολιτικῆς Δικονομίας*); Alkibiades Krassas, Roman law; Neokles Kazazes, political economy; Ioannes Papaloukas Evtaxias, civil law; Georgios I. Angelopoulos; Nikolaos Demaras, history of Roman law; Konstantinos E. Polygenes, Roman and Byzantine law.

Docents.—Timoleon Adamopoulos, political economy; Anastasios Stoupes, constitutional law; Charilaos Angelakes; Damianos Borres, penal law; Nikolaos Moschobakes, civil law; Georgios Lazarimos, commercial law; Antonios Ronteres, international law; Michael Libadas, political economy; Othon Phosteropoulos, French law; Ioannes Raises, commercial law; Soterios Krokides, commercial law; Spyridon Balbes, penal law; Konstantinos Ralles, Roman law; Demetrios Zalouchos, natural law; Spyridon N. Damaskenos, commercial law; Georgios Dyobouniotes, commercial law; Konstantinos I. Kyriakos, international law; Timoleon Heiopoulos, penal law; Elias Liakopoulos, Roman law; G. Kallisperes, history of Roman law and institutions of Roman law; A. Typaldos Basins, political economy; D. E. Oekonomides, Roman law; Elias D. Zengeles, publicistics; G. Streit, private international law; N. Pharantatos, Roman law.

MEDICINE.

Professors.—Andreas Anagnostakes, surgical pathology; Konstantinos Bousakes, physiology, director of the eye institute; Demetrios G. Orphanides, special pathology and therapeutics; Panagiotes G. Kyriakos, encyclopedia and methodology of medicine and general pathology; Konstantinos P. Deligiannes, medicinal clinics and pathology; Pavlos Ioannou, science of operations, topographical anatomy, ligatures; Michael Chatzimichales, special nosology, subdirector of the city clinic; Spyridon Manginas, surgical pathology and surgical clinics; Georgios Karametsas, medicinal clinics; Ioannes Zochios, experimental psychology and comparative anatomy; Anastasios Zinnes, clinics and pathology for diseases of children, director of the infant asylum; Demetrios Konsolas, midwifery, director of the lying-in hospital; Demetrios Chassiotes, pathological anatomy and histology, director of the laboratory for pathological anatomy; Rhegas I. Nikolaides, anatomy, director of the anatomical seminar; Michael Katsaras, neurology and diseases of the mind; Georgios Baphas, medicinal jurisprudence and toxicology; Nikolaos Makkas, pharmacology; Joulios Galbanes, surgical clinics.

Docents.—Nikolaos Dellaportas, ophthalmology; Georgios Tzannetopoulos, gynaecology; Perikles P. Patrikios, external pathology and surgery; Timoleon Loues, surgery, operations, and ligatures; Charilaos Olympios, anatomy; Nikolaos Lampadarios, special nosology; Konstantinos Digenes, midwifery; Basileios Protopoulos, syphilis; Spyridon Rosolymos, diseases of the skin and syphilis; Spyridon Spathes, surgical pathology; Elias Philippakopoulos, ophthalmology; Antonios Kallibokas, medicinal jurisprudence; Spyridon E. Kontoleon, surgical pathology; Konstantinos P. Kyriazides, pathology of children; Alexandros Triantes, midwifery; Alexandros

Alexandrogiannos, midwifery; Epameinondas Stathakopoulos, special nosology; Konstantinos Matsales, topographical anatomy and science of operations; Antonios Kindynes, midwifery; Evangelos D. Kalliontzes, surgical pathology and therapeutics; Theodoros Panopoulos, ophthalmology; Orestes Dalesios, pharmacology; Sokrates Tsakonas, gynaecology; Demetrios Karekles, pharmaceutics; Georgios Trochanes, pathology of children; Bartholomaeos Gkizes, surgical pathology; Demetrios Balanos, midwifery; Lampros I. Charames, surgical pathology; Georgios Karyophyles, special nosology; Demetrios Blachos, surgical pathology; Miltiades S. Bellines, anatomy; G. Sklabounos, anatomy; F. Pavlines, special pathology; I. Karabias, pharmacology; Demetrios Menetriades, pathology; G. Phokas, special pathology; M. Sakorraphos, general pathology.

PHILOSOPHY.

Professors.—Anastasios K. Chrestomanos, general experimental chemistry, director of the chemical department; Konstantinos S. Kontos, Greek philology; Georgios Mistriotes, Greek philology; Ioannes Pantazides, Greek philology; Konstantinos Metsopoulos, geology and mineralogy; Chrestos Papadopoulos, philosophy; Demetrios Kokkides, astronomy; Ioannes M. Hatzidakes, mathematics; Timoleon A. Argyropoulos, experimental physics; Georgios N. Hatzidakis, comparative philology; Kyparissos Stephanos, mathematics; Spyridon P. Lampros, universal history; Spyridon Bases, Latin philology; Spyridon K. Sakellaropoulos, Latin philology; Demetrios Patsopoulos, universal history; Nikolaos Polites, mythology and Greek archæology; Pavlos Karolides, history of the Greek people; Spyridon Emm. Meliarakes, botany; Anastasios K. Damberges, pharmaceutical chemistry, director of the pharmaceutical seminar; Nikolaos Ch. Apostolides, zoology; Margarites Evangelides, history of philosophy.

Docents.—Michael Defner, comparative grammar of the ancient languages, assistant director of the library; Kyriakos Mylonas, archæology; Panagiotes Kabbadias, archæology, ephor of antiquities; Antonios Koutsobeles, history of philosophy; Themistokles Sophoules, archæology; Georgios Tserepes, Sanskrit grammar; Georgios Kremos, ancient Greek history; Antonios Giannares, Greek literature; Andreas Skias, Greek philology; Ioannes Polites, pharmaceutical chemistry; Telemachos Komnenos, chemistry; Sokrates A. Papabasileiou, geology and mineralogy; Demetrios Kalopothakes, history.

CHAPTER IX.

SUNDAY SCHOOLS.[1]

CONTENTS.—*Introductory note.—General sketch of Sunday schools to A. D. 1865.—Evangelical Lutheran Sunday schools.—Evangelical Sunday schools.—United Evangelical Church Sunday schools.—John Amos Comenius and the Moravian Brethren.—Presbyterian Sunday schools: Presbyterian Church in the United States of America; Presbyterian Church in the United States.—Reformed (Dutch) Church in America Sunday schools.—Reformed (German) Church in the United States Sunday schools.—Holland Christian Reformed Church in North America Sunday schools.—Congregational (Trinitarian) Sunday schools.—Baptist Sunday schools.—Protestant Episcopal Sunday schools.—Methodist Episcopal Sunday schools.—Methodist Episcopal, South, Sunday schools.—United Brethren in Christ Sunday schools.—Friends' First-day schools: Orthodox; Hicksite.—Universalist Sunday schools.—Consolidated statement of Sunday schools, by given denominations, included in the international reports.—International Sunday School Convention.—Home department.—Hebrew Sabbath schools.—Latter-Day Saints Sunday schools.—Roman Catholic Sunday schools.—Unitarian Sunday schools.—Consolidation of all reports of attendance obtained.—Libraries.—Summary.—Note on statistics.*

[NOTE.—Statistics for the Sunday schools of the United States are not entirely satisfactory in respect to accuracy, for reasons that will appear in this chapter.

At the present time the International Sunday School Convention, meeting once in three years, is the most prominent agency for securing the statistics of enrollment in Sunday schools. The last session was in June, 1896. In its reports, no date is given for the statistics, but they are presumably for the year ending with the meeting. The reports of the convention are mainly limited to "evangelical Sunday schools," leaving the enrollment of several bodies sustaining Sunday schools to be sought in some other way. Many denominations publish the enrollment of their Sunday schools. Some use, apparently, the calendar year; others use a year ending with some month other than December. A part of the denominational year books for 1896 are much more definite regarding Sunday schools than the corresponding books for 1897. For the reasons above mentioned no better or later results are likely to be available before 1899.]

INTRODUCTORY NOTE.

There is a risk in calling anything the first of its kind. Some one is very apt to be reminded of another still older. No man can tell when the first Sunday school was taught; but following back the inquiry along the lines of Christian teaching into those of Judaism, one will find himself transported to a remote past, with a possible

[1] By James H. Blodgett, A. M.

Sunday, or Sabbath, school still beyond him. It flatters our vanity to claim the Sunday school as a token of hardly more than a century's progress, but that view requires us to ignore the works of earlier centuries and of other people.

It has been deemed best in this report to present Sunday schools mainly as seen by others, especially by those prominent in the work, and to restrict comments of the compiler within narrow limits. This plan does not produce a statement of conditions as systematically arranged as could otherwise be prepared, but it enables a comparison to be made of many authorities whose value each reader can weigh in the light of his own knowledge and convictions.

While the principal interest centers upon present schools, the history of the use of a special day for weekly religious instruction of youth has such value as to suggest a chronological order. This would require a notice, first, of Jewish schools, then of Christian—that is, of Catholic, Moravian, Lutheran, Reformed, and the later ones that have grown out of them—with notice of such current movements as have marked peculiarities. In giving prominence to reports of the International Sunday School Convention the chronological order indicated above is disturbed.

There is first a general sketch of Sunday schools, then a Lutheran view of Sunday schools, followed by a statement of the principles of education laid down by the great Moravian teacher, Comenius, as most completely expressing the convictions of reformers and the denominations that trace their history to the reformers, after which follow certain other groups whose returns are available, with any special peculiarities they may present, summed up in the international report. After the international report are noticed the Catholic, the Hebrew, the Unitarian, and the Latter-Day Saints schools, followed by a summary and a note explaining the imperfection of returns.

The Lutheran extracts touch upon early history and fill out some omissions in the opening statement which could not well be put in their chronological order without sacrificing the unity of a citation or duplicating matter. The Protestant Episcopalian makes great use of church catechisms. The International Sunday School Conventions embrace denominations with a general similarity of practice in their Sunday schools. The Friend and the Unitarian reach over the lines of Biblical texts to a range of topics limited only by human welfare, as most fully shown in the statement of Friends Schools in England, by John William Graham. The work of the present Hebrew continues that of his devout ancestor. The earnestness of Roman Catholic instruction is suggestive. The fullness with which the Latter-Day Saints, youngest among great religious bodies, have adopted systematic methods of instruction will indicate a source of their power to those who advocate other views.

In attempting to treat of the Sunday schools of the United States

with impartial fairness one can not include or exclude schools, sects, or denominations upon the basis of his sympathy with their forms of doctrine. All here included, however, accept at least the Old Testament Scriptures, all recognize the same God, and all use the same day as a day of special religious instruction.

GENERAL SKETCH OF SUNDAY SCHOOLS.

The Sunday school is prominent among popular educational agencies. So popular, indeed, has it become that we are in constant danger of forgetting the work for which it is presumed to exist in the prominence given it as an organization, exalting the machinery above the product, the means above the end.

The following quotation expresses a general conviction as to religious instruction:

> Mankind has not lived for so many centuries on this little planet without arriving at some safe conclusions. One certainly is that the great forces of human character can not be properly guided without training and intellectual equipment.
>
> This great principle, if granted, includes certain lesser truths, one of which is that moral and religious education are just as needful as intellectual training. Some of us would say that ethical and spiritual development are of first importance.[1]

Friedrich Froebel, the apostle of the Kindergarten (1782–1852), said:

> Every human being, as a being proceeding from God, existing through God, and living in God, should raise himself to the Christian religion—the religion of Jesus. Therefore the school should first of all teach the religion of Christ; therefore it should first of all, and above all, give instruction in the Christian religion; everywhere, and in all zones, the school should instruct for and in this religion.[2]

The following extract from the laws of Delaware seems unique for this country, in making an appropriation from public funds for Sunday schools:[3]

> Chapter XLI.—Of Sabbath schools.
>
> SECTION 1. The levy court of each county is required to pay annually, by orders on the county treasurer, to the teachers of each Sabbath school kept therein for three months or more in the year fifty cents for each white scholar, upon the report of such teachers, or of the superintendent, verified by the certificate of two credible citizens, stating that the said school has been regularly held for more than three months in the year and the average number of scholars in such school: *Provided*, That the sum annually paid in any county under this chapter shall not exceed five hundred dollars.
>
> SEC. 2. That in Sussex County the teachers, or persons having charge of such school, shall return to the levy court of said county in March, annually, the man-

[3] Revised code of 1852 as amended 1893.

ner in which such appropriation has been applied and the vouchers therefor; and in default of such return, the levy court shall make no appropriation to said school for the next year.

The law as originally passed, February 3, 1821, allowed 20 cents a scholar, with a maximum of $200 a county; afterwards amended to 40 cents a scholar and $400 a county, and again to its present form.

The spirit of the lawmakers may be inferred from the preamble of a law passed January 29, 1817, to incorporate a Sunday school:

Whereas the establishment of Sunday schools, especially in the vicinity of extensive manufactories, is calculated not only to promote the instruction of the youth in those useful establishments in the first rudiments of learning, but to conduce greatly to their good and orderly behavior by preventing them from spending the Sabbath in idleness and contracting habits of vice and immorality:

SECTION 1. *Be it enacted, etc.*, That * * * shall be, and they are hereby, constituted a body politic and corporate by the name of the trustees of the Brandywine Manufacturers' Sunday School. * * *

In the reports for 1866 and 1869 of Oramel Hosford, superintendent of public instruction of the State of Michigan, space is given for reports of the superintendent of the American Sunday School Union in that State, who, in the report for 1869, claims that—

The Sunday school does step in and quicken the sense of responsibility for education in these neglected communities. It works side by side with the common school in building up the character and intelligence of the people.

In his report as superintendent of common schools of the Commonwealth of Pennsylvania for the year ending June 3, 1867, J. P. Wickersham welcomes the work of Sabbath schools as advantageous to the cause of public schools and pleads for reciprocal aid among those interested in the two forms of education.[1]

The fundamental purpose, ethical or moral and religious education, needs emphasis that we may the better estimate the relation of the agencies used. Any agency becomes relatively insignificant if the work it would do is accomplished through other means. Even the day of the Sunday school becomes subordinate, in the view of Henry Clay Trumbull, who, after enumerating several items that constitute a Sunday school, says:

All of these particulars being found, a gathering is substantially a Sabbath school, on whatever day of the week it assembles or by whatever name it be called.[2]

Dr. Trumbull, in broadening his definition to cover all days, gives opportunity to recognize some sympathy of purpose in all people who meet for the study of the Word of God as they accept it. This would bring to view that not only those who accept the Hebrew or the Christian Scriptures—the Jews, the Christians, and the Mohammedans—have had such schools, but all religionists who are of a civilization sufficiently advanced to have any sacred books.

---

[1] Page xli.

[2] Yale Lectures on the Sunday School, p. 4.

The religious schools of Mohammedans, of Hindus, and of Parsees have to us but a remote interest in community of ulterior purpose. For all but exceptional cases we may accept for the United States the definition that "a Sunday school is an assembly of persons on the Lord's Day for the study of the Bible, moral and religious instruction, and the worship of the true God."[1]

This will involve a study of the schools of the Jews using the Old Testament Scriptures and of the schools of the Christians using the Scriptures of the Old and New Testaments.

Sunday schools in some form are as old as the observance of the Sabbath by families, which formed the unit of primitive instruction. Hebrew authors sometimes date back to the prophet Samuel, and they often state that to each synagogue was attached a school in the later days of the nation.[2] The intense zeal of the Jew for education in all the vicissitudes of that people was set forth by J. J. Noah in the Report of the Commissioner of Education for 1870.

The Roman Catholic Church holds that religious instruction is an essential part of all education. Insisting upon such instruction daily, the Sunday school has not been so prominent in that church as a dependence upon it for religious teaching would make it. Within recent years the number of children who attend public schools and the conditions regarding religious instruction in these schools have apparently prompted greater attention to Sunday schools among Roman Catholics. They now have a great number of Sunday schools, occupying about an hour of each Sabbath in catechetical instruction and in Bible history. Some churches have also Saturday morning classes for pupils of the public schools.

Some Protestants hold views similar to those of the Roman Catholics as to need of religion in every stage of education. A few are unwilling to accept any instruction separated from religious influences, and so there are some permanent parochial schools and a great number of secondary and superior schools under the religious motives. There are some who utilize the public schools for ordinary instruction and endeavor by brief terms of parochial schools in the vacations of public schools to secure religious foundations in the minds of the children.[3] Those who have temporary parochial schools generally have Sunday schools also. To the great multitude of Protestants and of those who have no very earnest adherence to any profession the Sunday school has now become the principal agency for religious instruc-

[2] Henry Clay Trumbull, in Yale Lectures on the Sunday School, gives many corroborative citations, including traditions extending to Moses and even to Methuselah. (See also the article "Schools," McClintock & Strong's Cyclopedia of Biblical, Theological, and Ecclesiastical Literature.)

[3] Parochial schools form the subject of pp. 1617–1671, Report of the Commissioner of Education, 1894–95.

tion. The large Sunday schools with convenient equipment are divided into at least three general departments: Infant or primary, intermediate, adult or advanced. Within late years another has been introduced, known as the home department. In this department are enrolled persons who can not attend the school, but who study the lessons and read the prescribed passages at home, reporting in some form to the school officers. Their names sometimes swell the rolls, somewhat as the names of students in university extension courses might swell the catalogue of the parent institution if so used.

There is a vast amount of material ready for the Sunday school in the way of helps, lesson leaves, weekly comments on the lessons in religious and secular papers. The Sunday school as established in this country was intended as a help to home training. In modern life, where so many families separate for their various occupations before breakfast and rarely come together at any meal, home education has lost ground. The advocates of the Sunday school may seriously inquire whether it has grown to the fulfillment of the work thus left for it to do or whether it is possible by any external agency to supply the place of home influence.

The Jewish habits of education descended into Christian practice and religious instruction is everywhere commensurate with the state of the church. The early reformers, such as the Albigenses in the eleventh century, the Waldenses in the twelfth, John Wycliff in the fourteenth (1324(?)–1384), John Huss (1369–1415) in the fourteenth and early in the fifteenth, and the Bohemian or Moravian Brethren in the latter part of the fifteenth century, all laid special emphasis on instruction in the Scriptures. The Catholic Church kept up a degree of instruction in periods of decline, the Waldensian movement originating at Lyons, where there was already a famous cathedral school. The reformer Martin Luther (1483–1546) laid down a scheme for complete education by the State in which religious instruction was fundamental. Of the relation of Luther to Sunday schools more will appear in treating of Lutheran schools. Apparently quickened by the activity of the reformers, the mother church produced great agencies for education. Ignatius Loyola (1491–1556) organized the Jesuits and inspired a zeal for religious instruction, and Cardinal Carlo Borromeo (1538–1584) is by some called the founder of Sunday schools.[1]

A little later, on the reform side were Comenius (1592–1670), Philip Jacob Spener (1635–1705), and Hermann Francke (1663–1727). On the Catholic side, in the same period, was the organization by Jean Baptiste de la Salle (1654–1719) of the Brothers of Christian Schools (1684), an order devoted to teaching and founding their work on a religious basis.

The contemporaries of Luther, Ulric Zwingli (1484–1531) and John

[1] American Encyclopedia.

Calvin (1509–1564) in Switzerland, John Knox (1505–1572) in Scotland, were, like him, earnest for religious education. The influence of the Swiss reformers especially was felt in France and the Low Countries. The Presbyterians and the Baptists in the United States have a special inheritance from the Huguenots, the Scotch Presbyterians, and the Holland reformed bodies, and the present Congregationalists were influenced by the contact of their fathers with Holland.

As will be seen later, the Lutherans claim a continuous history of nearly four centuries for their Sunday schools; the Roman Catholics would hardly acknowledge any complete cessation of their Sunday schools, at least from the days of Borromeo. It is altogether probable that Sunday schools had not wholly died out in England, but they were of limited influence when, in 1780, Robert Raikes gathered poor children in Gloucester, England, to teach them to read, utilizing the Sabbath as the day when they were not at work, and so far having the Bible in view that Bible societies grew out of his labors. Some writers are content to call Robert Raikes the founder of the modern Sunday school, which, however, needs a further limitation, making it the modern Sunday school as initiated in England.

The Sunday schools of Germany require such characterization as will show their historical relations and enable anyone who wishes to follow the subject further to do so intelligently. It is said[1] that the Church Reformation was destructive as well as constructive, and that some of the schools existing in cities and villages under the auspices of the Catholic Church were displaced. It is to be remembered that the German Empire of to-day, and yet more the Germany of earlier years, is not a unit to which any statement will apply uniformly, but it comprises a multitude of States (26) as independent and as unlike in internal administration as Maine and Texas in our own country. Therefore the student of German history has constant need of caution to discriminate between what was true in some State of Germany and what was true for Germany as a whole. The general requirements in German States have been for attendance at school till 14 years of age. Certain causes for relaxation of the law were recognized, but the authorities did not relax the requirements for education; they simply modified the mode of acquirement and established supplementary or extension schools, nights and Sundays, which became a part of the system of the State, and within the last fifty years, in some communities, attendance has been compulsory to 18 years of age. The State, comprising a State church, carried the system of parallel secular and religious instruction existing in week-day schools into these supplementary schools. Their secular work is influenced by local needs. Courses in agriculture, commerce, industry, and forestry

[1] Kath. Schulzg. (Bayern) Nr. 3, etc., cited in Das gesamte Erziehungs- und Unterrichtswesen in den Ländern deutscher Zunge. Jahrgang I, Heft 5. Berlin, 1896.

are established according to the prevailing occupations of the patrons. Other phases of German Sunday schools will appear under the title Lutheran.[1]

In our own country the Sunday school has nominally been almost wholly for scriptural instruction and the school has usually been assigned but a brief portion of the day, in one session, not exceeding an hour and a half, on the presumption that other religious services would occupy the attention of the members. In recent years the Sunday school has tended to be the only service for the very young.

In this country voluntary teaching is nearly universal, but there are a few great Sunday schools that seem to demand the time of their superintendents to such a degree that a small number receive pay from the churches. A considerable proportion of the teachers in the Hebrew schools are paid. Complete statistics are not available as to the payment of teachers. At an early stage of the Raikes movement the cost of paid teachers began to look formidable, and voluntary help was utilized to a great extent. It is easy to understand that very excellent people of high qualifications, supported by other means, might be found to devote an hour or two on one day to scriptural teaching without hindrance to ordinary duty, but it can hardly be expected that an unqualified indorsement will be given to the following claims for voluntary service:

> Hireling teachers can scarcely be expected to possess either the zeal or the ability of those who now engage in the work from motives of pure benevolence. Gratuitous instruction was an astonishing improvement of the system.[2]

While selected volunteer teachers without compensation may be better than some paid teachers, the logic of the quotation would put all our schools and all religious and humanitarian enterprises in the hands of unpaid leaders, to the exclusion of paid teachers, superintendents, and pastors.

England was the scene of a disintegration of ecclesiastical unity, beginning even before Henry VIII claimed the supremacy of the Eng-

[1] The following extract, translated from a German report, exemplifies the conditions in Würtemberg: "The Sunday schools are a very old institution in Würtemberg. The first beginnings of Sunday schools may be traced to a church regulation of 1559. In the year 1695 these regulations concerning the schools are more definitely formulated, and in 1739 (the ninth synodical regulation) attendance upon Sunday schools appears as a general legal requirement. The following quotation makes this very plain: 'Young people must attend Sunday and holiday schools regularly until they marry, so that they will not forget easily what they have learned in the elementary schools; and for the additional reason that they will not pass the time on Sundays and holidays in sinful pursuits, but learn hymns, read the Bible, recite scriptural passages and the Psalms, as well as the principal parts of the catechism, write and read letters, and close the sessions with prayer and blessing.'" (Origin and development of industrial continuation schools in Würtemberg, 1889, p. 3, footnote.)

[2] Rev. John Angell James, as quoted under Sunday schools in McClintock & Strong's Cyclopedia of Biblical, Theological, and Ecclesiastical Literature.

lish Church (1534). Not only was there a breaking down of established usage in the independency that sprung up on all sides, but England drifted out of harmony with the religious habits on the Continent, in Scandinavia, or even in Scotland. By the latter part of the eighteenth century religious instruction was chaotic, and opportunity prompted the movement of Robert Raikes, closely paralleled, if not anticipated, by the work of John Wesley, who seems to have been deeply impressed by his intercourse with the Moravian, Peter Boehler, in London, in 1738, and with Count Nikolaus Ludwig von Zinzendorf, at Hernnhut, Saxony, in 1739.[1]

Had the English people but obeyed the rules laid down in their own state church they would have had no occasion to take up a recent date for the origin of their Sunday schools. Dr. Trumbull cites the fifty-ninth canon of 1602, never repealed, which requires that—

> Every person, vicar, or curate, upon every Sunday or holiday, before evening prayer, shall, for half an hour and more, examine and instruct the youth and ignorant persons of his parish in the Ten Commandments, the Articles of Belief, and in the Lord's Prayer, and shall diligently hear, instruct, and teach them the catechism set forth in the Book of Common Prayer.[2]

The same canon also provided—

> That parents or servants who persistently neglect to send their children or servants to be catechised are to be excommunicated.[3]

The Sunday school of the United States followed closely upon its revival in England, and numerous schools were established before the year 1800. In 1824 the organization of the American Sunday School Union at Philadelphia marks a great enlargement of the work. There had been a First-day, or Sunday School Society (1791), and a Philadelphia Sunday and Adult School Union (1817), as well as a New York Sunday School Union (1816). In 1827 the Sunday School Union of the Methodist Episcopal Church was organized in New York. Both the last named and the American Sunday School Union inaugurated a multitude of schools and published a great amount of Sunday school literature, including books for libraries. Other societies of less permanence or more limited scope have been formed since 1825. The American Sunday School Union published in 1826 a series of Uniform Limited Lessons, and later various Union question books. Similar aids had been published by different parties before 1865, when coincident with the close of the civil war a marked tendency developed toward greater uniformity of effort, accompanied by a great increase in the circulation of periodicals containing notes and other helps upon

[1] Many of these particulars as to early Sunday schools are stated by Henry Clay Trumbull, in Yale lectures on the Sunday school. For Wesley and Zinzendorf see pp. 106–108 of Yale lectures.

[2] Idem., p. 74.

[3] What is the law of the Church? By George Serrell, LL. D. Contemporary Review, November, 1896.

selected lessons, and culminating in the adoption upon a broad scale of the international system in 1873. That system claims as a great advantage that over all the world millions are studying the same lesson at the same time.

If we were to follow the broad definition of Sunday school adopted by H. Clay Trumbull, which takes religious instruction rather than the day as the essential element, we could make for the first half of this century a long list of educational authorities allied with its purpose. Their plans and their practice involved far more religious instruction in each week than the usual Sunday school gives. Among those who deemed the religious motive essential and made religious instruction a part of the daily programme were Eliphalet Nott (1773–1866), president of Union College; Thomas H. Gallaudet (1787–1851), a pioneer instructor of mutes; Mrs. Emma Hart Willard (1787–1870), teacher and author; William C. Woodbridge (1794–1845), editor of American Annals of Education; William A. Alcott (1798–1859), a writer of many books on education; George B. Emerson, especially influential in Massachusetts and New York; and the three brothers, Jacob Abbott (1803–1879), John S. C. Abbott (1805–1877), Gorham D. Abbot[1] (1807–1874). There might be added many more names, including those of early principals of normal schools.[2]

Some of the persons named and others wrote much of the philosophy of religion, principles of teaching and of mental growth, but certain books of the same period published in England were more specific as to details of Scripture lessons or gained more permanent hold than publications just mentioned.

In the publications of the Society for Promoting Christian Knowledge, organized in 1698, and in those of the Home and Colonial Infant School Society, as well as in those of the British and Foreign School Society, Scripture lessons are prominent.[3]

The committee of the Home and Colonial Society say:

> What they [the committee] are desirous of seeing in every infant school is—
> First. A simple course of religious instruction in which the great aim should be to teach the Scriptures, to teach the elementary truths of the Gospel, and to cultivate religious feelings and impressions.

[1] The variation in spelling the surname is intentional and follows the custom of the brothers.

[2] For example: Practical lectures on parental responsibility and the religious education. By S. R. Hall, Boston. Published by Peirce & Parker, No. 9, Cornhill, 1833. 12°, 176 pp. The preface is dated at the Seminary for Teachers, Andover. Samuel Read Hall (1795–1877) is credited in Appleton's Cyclopedia of American Biography with the organization of the first school in the United States for the training of teachers, at Concord, Vt., 1823. His Instructor's Manual or Lectures on Schoolkeeping (Boston, 1829) and Lectures on Education have not been accessible for this report.

[3] For example, see Model Lessons for Infant Schools, Teachers and Nursery Governesses, prepared for the Home and Colonial Infant School Society. By the author of Lessons on Objects, etc. [Dr. and Miss Mayo] London, 1838. 16°, 167 pp.

Secondly. A careful moral training on the standard of the Word of God; Christ set forth as our Saviour and our example; and the Holy Spirit earnestly sought as the only and all-sufficient help.

Thirdly. The cultivation of habits of accurate observation, correct description, and right judgment upon the things of nature and art.

Lastly, the improvement of the bodily organs and health by varied exercise.[1]

The System of Infant Schools, London, 1826, by William Wilson, A. M., vicar of Walthamstow, and a Manual of Instruction for Infant Schools, of which an edition was reprinted in the United States, emphasize moral education grounded on the principles of the Bible as their chief object.[2] "A teacher of an infant school should be a constant student of the Scriptures."

In this connection may be mentioned Hints for the Improvement of Early Education and Nursery Discipline,[3] issued anonymously and reprinted in many editions in England and several in the United States.

Merely mentioning Governess Life, a little book for family instruction in which religion is made the foundation for all instruction,[4] and recalling Samuel Wilderspin's Infant System, repeated in many editions after its publication in 1823, and containing elaborate lessons on Scriptural subjects, more definite attention may be directed to books explicitly recognizing Sunday school work. Dunn's Principles of Teaching bears the imprint of the Sunday School Union.[5] An edition with some modifications of title and matter was printed in the United States, with a preface by T. H. Gallaudet.[6]

In that portion especially devoted to moral and religious influence, Secretary Dunn says:

In all attempts to exercise moral influence over the young, the faithful inculcation of divine truth from the Bible is the first point to be regarded. * * *

I shall say, then, first of all, if it be possible, let every child have every day some portion of divine truth, however small, stored up in its memory and understanding. It is the reiteration, day after day, of truth upon the mind that makes the impression.

[5] Principles of Teaching; or, The Normal School Manual, containing Practical Suggestions on the Government and Instruction of Children. By Henry Dunn, secretary to the British and Foreign School Society. 5th edition. London. Sunday School Union. 12°. pp. 274. No date. (Not later than 1837.)

[6] The School Teachers' Manual, prepared for publication in this country. With a preface by T. H. Gallaudet. Hartford, 1839. Sm. 8°. pp. 223.

Scant justice can be done the author's "Principles" in such brief quotation. He quotes Fellenberg as saying:

> Let this [the Old Testament] be the first history presented to the child, and let him be deeply imbued with the spirit of the Bible. * * * The best practical example for the educator is to be found in the Saviour of men; and in the result we should aim at no other object than the realization of that Kingdom of God to which he has directed mankind.[1]

Stow's Training System, in its earlier editions,[2] devoted over one-fourth its pages to Bible training, besides the recurrence to the Scriptures for illustrative material throughout the whole. Later editions include Bible training for Sabbath schools. In its amplified form this book is one of the most comprehensive manuals on education. There are chapters that deal with the distinction between teaching and training, the sympathy of numbers, and the minutest detail of model Bible training and secular training lessons, as well as social conditions, reformatory efforts, and the equipment of a school. It is hardly less a manual for a preacher than for a teacher, so fully does it treat of the principles by which one person is to influence another by personal and public effort.

Some of the books cited above have disappeared from current trade, and are only to be found in certain libraries and old book stores. Dunn's Principles of Teaching and Stow's Training System are still to be had through importing booksellers.

A great change took place in Sunday school work in the United States after the civil war. Although the use of any fixed date for that change might provoke dissent, it was so nearly coincident with the revolution in various social conditions brought about by the war that it hardly involves error, and it adds greatly to the convenience of memory, to consider the new era as beginning with the rearrangement of forces when peace was declared. Although the general history of Sunday schools to that time need not be further separately treated here, the story of denominational movements in later pages will involve statements relating to earlier times.

It will be noticed that the space given to individual denominations is not in proportion to the numerical strength of their Sunday schools. It occurs that prominent leaders in the great "International Lesson movement" were of the Methodists and the Baptists, the largest Protestant denominations of this country. Even had no others joined them, it would have resulted that the conduct of the great mass of Sunday schools under the auspices of the International Sunday School Conventions would be better understood by the public than that of

[2] Moral Training and the Training System, established in the Glasgow Normal Seminary and its Model Schools. By David Stow, esq., honorary secretary to the Glasgow Educational Society, author of Moral Training, etc. Fifth edition. Blackie & Sons, Glasgow, Edinburgh, and London, 1841. 12°. 400 pp.

churches less prominently identified or not identified with the international movement. The literature of the International Lessons is only less widely diffused than the daily newspaper. Not only do denominational weekly journals regularly devote columns to the international lessons, but many daily papers set apart columns of their Saturday issues for the same purpose. It has therefore seemed fitting to give more space to denominations not so fully identified with the lessons popular at this time and to cite particularly the principles which some of them lay down as a basis of work, principles often essentially identical with those that might have been selected from the more generally known sources.

EVANGELICAL LUTHERAN SUNDAY SCHOOLS.

For the sake of unity, Lutheran religious instruction to the present time will be taken as a whole.

Martin Luther (1483–1546) published a German translation of the New Testament in 1522, and two catechisms, the large and the small, in 1529. He completed the translation of the Bible in 1532. Luther laid great stress upon hymns as an element of religious instruction. He insisted upon education with such an earnest effectiveness that the German systems of to-day rest largely upon the spirit inspired by Luther, and religious instruction was the very foundation of his plans for national education. Some writers give him credit for a great upbuilding of Sunday-school work. The Lutheran view of his work is shown in the succeeding quotations.

The Lutheran Church Review of October, 1896, is almost wholly devoted to the subject of Sunday schools. There are 24 distinct articles from 3 to 13 pages each.[1] These articles, partly reprints,

[1] The articles in addition to minor comments are: The Decadence of Sunday-School Music, Prof. Frederic Reddall; The Sunday School in History, Prof. William M. Wackernagel, D. D.; The History of the Sunday School, F. J. F. Schantz, D. D.; History of the Sunday School in the Ministerium of Pennsylvania, Rev. J. W. Early, A. M.; History of the Lutheran Sunday School in Philadelphia, Rev. C. M. Binder, A. M.; History of the Lutheran Sunday School in New York, George M. Boschen, esq.; The German Sunday Schools, Rev. G. C. Gardner, A. M.; The Place and Usefulness of the Sunday School in the Lutheran Church, Rev. J. A. W. Haas, A. M.; The Lutheran Sunday School, G. H. Trabert, D. D.; Prof. H. N. Fegley, A. M.; The Relation of the Sunday School to the Church, H. M. M. Richards, esq.; Typical Non-Lutheran Sunday Schools, Rev. Myron O. Rath, A. M.; The Swedish Sunday Schools, A. Rodell, D. D.; English Lutheran Sunday Schools in the West, Rev. J. F. Beates, A. M.; Lutheran Sunday Schools in the South, Rev. Z. W. Bedenbaugh; Sunday Schools in Germany, Prof. D. Werner; The Sunday School in Berlin, Rev. D. S. Schaff; The Sunday-School Work of the Evangelical Lutheran Church, Prof. L. Baugher, D. D.; The New General Council Sunday-School Hymn and Music Book, Rev. F. F. Buermeyer, A. M.; The Primary Sunday School, Mrs. J. L. Sibole; The Sunday-School Lesson, J. W. Horine, D. D.; The New General Council Sunday-School Apparatus, Theodore E. Schmauk; History and Critique of the American Sunday-School Lesson since the Civil War, Theodore E. Schmauk; Editorial Points of View. The Theory and Principles of the Sunday School.

form a compendium of the general history of Sunday schools and of the special Sunday-school work of Lutherans, explaining the need of religious instruction, the office of the Sunday school in aiding such instruction, the limitations of its conditions, with a great range of information upon questions as indicated by the titles. Unfortunately the edition was exhausted and the number is not readily accessible.

Regarding the Sunday school in history, Professor Wackernagel says:

> The Sunday school * * * is not an invention, a discovery of our modern times. Its origin is found in antiquity, its development in the subsequent ages.

The writer explains at some length the customs of the Hebrews, the early Christians, and the prereformation teachers, Waldenses, Wicklifites, Hussites, Bohemian Brethren, and others, who used catechisms containing the Decalogue, the Creed, and the Lord's Prayer. Of later religious instruction, he says:

> Methodical catechetical instruction in the manner practiced by the ancient church was revived in the creative period of the Lutheran Reformation. * * *
>
> The Lutheran princes, and especially the cities, in full recognition of the value and importance of Christian education, established catechetical services for children in the church on Sunday afternoon. These services were given in charge of catechetes, members of the ministerium, who possessed special gifts for this kind of church work. This catechetical instruction in interlocutory form was not limited to the one hour on Sunday. At Hamburg, e. g., the great preacher Balthazar Schuppius taught the catechism to his parishioners' children every morning before school. * * * One of the best "Sunday-school books" of all time is the Nuremberg "Kinderlehrbuechlein," of 1628, which for many years was extensively used in the old-fashioned Lutheran Sunday school, the Kinderlehre. The book contains in its first part the plain text of the topics of the five chief parts of the small catechism for the children in the primary department; in the second part, Luther's explanation of the same for the secondary department, and in the third part, in fifty-two lessons, an excellent exposition of Luther's explanation for the higher grades. One of the catechisms in use among us, the Hanover-Celle (Stohlmann), is founded on the Nuremberg manual.

The writer pays tribute to Philip Jacob Spener and his more widely known disciple and friend, August Hermann Francke, founder of the Halle Orphanage, as teachers of catechetics:

> Francke opened his "Ragged Sunday school" in his study in 1695, kept it open every day, and soon kept the ragged boys altogether until he laid the corner stone of the great orphanage in 1698. * * * The method he employed in imparting Christian knowledge was the interrogatory. Francke's was the leading spirit in the Christian circles of his time, and his educational methods were diligently followed. They were transplanted to our shores by H. M. Muhlenberg.
>
> The Lutheran "Sunday school" in Lutheran Europe, until the partial introduction of the Anglo-American Sunday school system thirty years ago, was, and is yet, the "Kinderlehre," conducted in church by the pastor alone, consisting in the declaratory explanation and interrogatory review of the Catechism and Biblical history (the study of which was generally introduced after the Thirty Years' War). But this one lesson on Sunday is not all the children get. Our church is a doctrinal, indoctrinating church; she is the "schoolmistress" among the churches.

Therefore, the "Kinderlehre" can not be the only occasion and opportunity for teaching and learning religious subjects. There is the daily instruction in the Catechism, Bible history, and the church hymns in the parochial school; the weekly catechetical recitations with the pastor in very many places; and above all, the thoroughgoing catechetical instruction before confirmation. * * *

The English Sunday school was introduced into America by the Methodist Bishop Asbury, in 1786.

Dr. Schantz shows that, while in schools of the early part of the century in this country instruction in reading, writing, and spelling was prominent, "the Sunday schools established chiefly for secular instruction soon felt the effect of the new system of religious teaching and gradually declined." In his personal recollections of Sunday schools he mentions aids furnished by various agencies, among which are "an excellent German Question Book, * * * a small work in German * * * for opening and closing the school, The Jugend Freund and the Youth's Penny Gazette," monthly, a Sunday school Union Hymn Book, Question Book of the American Sunday School Union, Barnes' Notes. In the Trinity Sunday school of Lancaster in 1853—

the order of service and the catechism were regularly used at the opening and closing of the school, and thus the Commandments, the Apostle's Creed, and the Lord's Prayer were repeated in each session. The pastor of the congregation met the teachers to aid them in preparing the lesson. All the features of the school had a decidedly churchly and Lutheran stamp. * * *

In 1857 the Sunday school [at Reading] held two sessions each Sunday.

Mr. Boschen states of the Lutheran Sunday schools in New York, that—

Nearly, if not all, of the schools have two sessions, one in the morning before service and one in the afternoon. * * *

It is very generally conceded that our church has utilized scarce a fraction of the wondrous power of her youth at command; and, with no effective oversight and a lack of systematic organization, the work of our Lutheran Sunday schools, as well as all other branches of our church work, has been left to the spasmodic activity of individual congregations. * * * We have no systematic, no effective, Sunday school organization. This want has been felt by a number of the more progressive workers, yet how to work harmoniously is the great question. Almost all of the schools use different lesson leaves; some none at all. Others use Biblical histories; yet others lay particular stress on the study of the catechism, and in many is added the study of the German language.

There are twenty-nine Lutheran Sunday schools in synodical connection in New York City, besides independent schools. Mr. Boschen makes this criticism upon the selection of teachers:

Another weakness has been our haste to take young people as soon as they were confirmed, on the plea of necessity, to make teachers of them. Without a proper appreciation of their high calling, with little or no ability to fit them for the post, they are given classes from a desire to assign some work to them where the least (?) harm can be done, and that place is the Sunday school! It is the place of all others where the foundation for future religious growth is laid and where the greatest care and conscientiousness should be exercised. After these young teach-

ers have been put in charge of a class, no effort is made to instruct them how to proceed. In answer to my question, "Do teachers have preparatory hours for the study of the lesson?" but eight schools answered affirmatively. It is therefore remarkable that the schools have apparently prospered so well.

The Rev. John A. W. Haas would reach the whole life without an age limit and—

the Bible study must be accompanied constantly by Luther's smaller catechism. * * * A Lutheran Sunday school should have the catechism as the principle of its whole grading, because the various stages of its knowledge are so bound up with the various stages of the Christian life in the Lutheran Church. There should also be a time set apart in every Lutheran Sunday school not only for memorizing but also for the explanation of the catechism.

In speaking of the Lutheran Sunday school Dr. Trabert defines—

the Kinderlehre of the Lutheran Church in Germany, instituted by * * * Rev. Philip Jacob Spener, about the year 1666. * * * This Kinderlehre was for old and young, but especially intended for the confirmed youth, and consisted in a brief opening service with singing, Scripture reading, and prayer, followed by examination in the catechism and the texts of Scripture illustrating the several parts.

The Sunday school goes further and is more comprehensive than the Kinderlehre. * * *

The system of instruction in the Lutheran Sunday school begins with the little ones and is continued through all the departments—infant, intermediate, and the so-called Bible class—having this sole aim: The honor of God in Jesus Christ our Lord. * * *

Persons not well grounded in the faith, who have no positive convictions with respect to the doctrines of the church, have no place as teachers in a Lutheran Sunday school, for it is of the greatest importance that the children be started right. * * *

Too much stress can not be laid on the service and hymns of the church in the Sunday school. * * *

It is of the greatest importance that the children early learn to appreciate the church's magnificent treasure in her matchless hymns and unrivaled service. The Sunday school must lead into the inner sanctuary by acquainting the children with and awakening a love for the full service of the sanctuary. To this end the matin and vesper service are peculiarly adapted.

The Augustana Synod is formed of Swedish churches. Rev. A. Rodell gives an explanation of Swedish religious education. He says:

The Sunday school was an institution with which the Swedish colonists were not at all familiar, as the children of the State Church of Sweden received their religious training in the public schools. * * * In the public schools of Sweden about an hour every day is devoted to the reading of the Bible and religious instruction. * * * The fundamental doctrines of Christianity and the tenets of the Lutheran Church are inculcated by trained teachers during the entire week, and, as a matter of course, the Sunday school can not be considered to be of the same importance there as it really is in this country, where no religious education is to be had in the public school.

As stated by Mr. Rodell, in 1886 there were 483 congregations and 17,406 scholars in Sunday schools; in 1896 there were 806 congregations and 42,847 scholars in this synod.

The description of English Lutheran Sunday schools in the West will serve well for other Sunday schools in the newer parts of the country. Rev. James F. Beates, writing from the State of Washington, says:

In the manner of conducting our Sunday schools there is little to distinguish them from those of the East. * * * We use the same publications and helps that are found in the Eastern schools, and in general follow the recommendations of the boards and authorities which are chiefly located in the East. And yet our schools are distinguished by their greater inability to carry out these regulations.

The chief difficulty we find is an insufficient force of effective officers and teachers. This universal want is the greater the farther west one goes. * * * .

A further hindrance to our work is the lack of male help. * * * The men ought to be as capable and willing to instruct the young as the women. The teaching force should be more evenly divided. The example of an active corps of men in the Sunday school is a powerful help in retaining the boys. * * *

Another evil peculiar to the West is the roving, shifting character of our people. * * * But few children in our frontier schools remain long enough to grow up from the infant to the Bible class. Hence there is not that rooting and grounding in the faith, that bond of attachment which the children in the older East enjoy.

The following table of the Sunday schools of the Evangelical Lutheran Church is derived from the Church Almanac, 1896, when not otherwise specified. It will be observed by those familiar with the Lutheran Church that some synods are not reported, and it will be seen by the table that certain others are only partially reported. The synods are not geographical in any strict sense, hence it is not practicable to make a table by States from the table by synods.

a Evangelical Lutheran Almanac, 1896, published by the Publication Board of the Evangelical Lutheran Joint Synod of Ohio and other States.

It would take this report into a wider field than is now expedient to point out in each case the indications of the influences of special national or religious influences brought into this country from abroad, but the distribution of forms of religious faith or practice points to antecedents, sometimes clear by present perpetuation of a foreign tongue, sometimes, especially as to Scotch, French Huguenot, Holland or Dutch, and Irish influences, obscured by an absorption of language or dialect into the Anglo-Saxon.

The Lutherans are mainly of German or Scandinavian descent. The following table of communicants, as shown in the census of 1890, will show their geographical distribution and afford a rough guide for the distribution of their Sunday school membership, which, in the aggregate, approximates one-third the number of communicants:

Communicants, Lutheran, 1890.

UNITED EVANGELICAL CHURCH SUNDAY SCHOOLS.

The United Evangelical Church is the name taken by a body recently a part of the Evangelical Association. Their Sunday-school statistics are given in The Evangelical Almanac, 1896, Harrisburg, Pa., by conferences, which can be distributed by States with general correctness without a separate table. The editor of the Almanac states that the statistics are imperfect, owing to delay in returns, for which the Almanac could not wait.

Sunday schools, United Evangelical Church, 1895.

Conferences.	Schools.	Officers and teachers.	Scholars.

GERMAN EVANGELICAL SYNODS OF NORTH AMERICA, SUNDAY SCHOOLS.

The organization known as the German Evangelical Synods of North America embraces about 1,000 congregations. In 1896 there were reported 185,203 communicants. There is a theological seminary at St. Louis, and there is a proseminary at Elmhurst, Ill., near Chicago. About one-half of the churches maintain week-day schools. A large part of the pastors are also teachers. Great attention is paid to the principles of teaching. The Paedagogische Zeitschrift, St. Louis, is a monthly devoted to the subject of pedagogy, especially as related to the conduct of schools in the German Evangelical Synods.

The Evangelischer Kalender, 1896, St. Louis, Mo., gives the number of Sunday school scholars as 82,628 and that of teachers as 8,694, not distributed by States.

JOHN AMOS COMENIUS AND THE MORAVIAN BRETHREN.

To understand the Moravians, we must look back at least three centuries. The Church of the United Brethren, Unitas Fratrum, or the Moravians, is the equivalent of the Bohemian Brethren who traced their denominational origin to John Huss (1373–1415). The last bishop of the Bohemian Brethren was John Amos Comenius (1592–1670), one of the most remarkable among educators. His outline of organization is followed in the best schools of to-day, and his Orbis Pictus was the prototype of the wonderful variety of children's illustrated books of later time. He left his impress upon schools of central Europe, but more distinctly upon those of Sweden and Denmark, being employed to draft plans and prepare books for the Swedish schools, partly by residents of Denmark. The recent translation of his principal treatise[1] is accompanied by a sketch of his life, which is utilized for the material here presented regarding his work.

The esteem in which educators hold the name of Comenius, the commanding influence he exercised upon the spirit of the Moravians and upon general education, and the orderly system of his plan make it specially fitting to cite his educational scheme as typical of views not limited to Moravians, but prevailing in various denominations.

In 1629, Wolfgang Ratke, supposed to exercise some influence on Comenius, had submitted a programme of education to a commission at Jena. The first of its items was "Everything is to be preceded by prayer," and the fifteenth, "Education should begin with religion." Comenius, anticipating more modern leaders in the philosophy and the art of education, prepared an outline of the Pansophic School about 1650, in which the work of a complete education was divided for seven classes. The general school was to spend the first hour of the morning in hymns, Bible reading, and prayers.

[1] The Great Didactic of John Amos Comenius, now for the first time Englished * * * by M. W. Keatinge, B. A. London, 1896. 8°. 468 pp.

In Class I, the Vestibular, with an inscription over the door, "Let no one enter who can not read," "The religious exercises consist of the heads of the catechism, together with a few short prayers and hymns." There is also prescribed "a course of moral philosophy suited to children."

In Class II, the Janual, with the inscription, "Let no one enter who is ignorant of mathematics," "The catechism is to be thoroughly learned."

Class III, the Atrial, was to have the inscription, "Let no one enter who can not speak."

In this class the boys should begin to read the Bible, but not as it stands. An abridged form, suited to their intelligence, should be given to them, and a portion of this must be expounded daily. * * * The history for this class is the famous deeds of the Biblical narrative.

Class IV, the Philosophical, is inscribed, "Let no one ignorant of history enter here."

A special collection of hymns and psalms must be arranged for this class; also an epitome of the New Testament, which should comprise a continuous life of Christ and His Apostles, compiled from the four Gospels. * * * The accessory study is Greek. * * * It is comparatively easy to learn to read the New Testament, and this is the chief utility of the study.

Over the door of Class V, the Logical, is the inscription, "Let no one enter who is ignorant of natural philosophy."

Religious instruction comprises hymns, psalms, and prayers. A Bible manual also, called the Gate of the Sanctuary, is to be placed in the pupil's hands. This is to contain the whole of Scripture history in the words of the Bible, but so digested that it may be read in one year.

Class VI, the Political, is inscribed, "Let no one enter who can not reason," "In Theology the whole Bible is to be read."

For the preceding classes only those injunctions have been selected which had a specifically religious character, but as all other studies are made to center in religious education, the whole plan for Class VII, the Theological, is given:

1. Inscription over the door: "Let no one enter who is irreligious."

2. The walls should be covered with mystic symbols, illustrating the wisdom hidden in the Scriptures. On one wall diagrams of Hebrew grammar may be traced.

3. The most devotional psalms and hymns of the church may be used, as well as prayers of a special nature taken from the Scriptures and from the works of the most inspired theologians and of the sainted martyrs. In addition, a compendium of Christian beliefs, duties, and hopes, written in the phraseology of the Bible, should be read daily.

4. The class book should be a work dealing with the last stage of wisdom on earth, that is to say, the communion of souls with God, and should consist of three parts:

(*a*) The ascent of the mind to God. In this a survey should be made of the universe, preserving the order of the Janua, and with regard to each fact should be pointed out what God tells us about it in the Scriptures, and how the Heaven and the earth and all that in them is tell the glory of God.

(*b*) The formal part should consist of a key to God's Book; that is to say, practical rules for reading the Scriptures with profit and for duly considering the works of God. Here a threefold commentary should be supplied: (1) From Scripture itself; (2) from reason; (3) from sense experience.

(*c*) The third part should be a repertory of theology, giving a detailed account of the mysteries of salvation.

5. In arithmetic the sacred and mystic numbers that occur in the Scriptures should be studied; also sacred architecture, as exemplified by Noah's Ark, the Tabernacle, and the Temple.

6. Universal history should be studied, and in particular the history of the church, for whose sake the world exists. * * *

7. In this class some training should be given in oratory. The future minister must learn how to address a congregation, and should be taught the laws of sacred oratory. The future politician must be taught how to appeal to the reason of his hearers.

8. The accessory study is Hebrew, which must be studied in such a way that before the end of the year the pupil shall be able to read and understand the original text of the Scriptures.

9. Recreation is to be allowed, but must not interfere with the theological studies.

10. Religious plays, dealing with the character of, say, Abraham or David, may be acted.[1]

In 1559 Calvin reorganized a Latin school at Geneva. It was insisted that—

Each lesson, no matter what the subject be, must commence with prayer.[2]

In the Great Didactic, Comenius says:

The holy Scriptures must be the Alpha and the Omega of Christian schools.[3]

Comenius divided the first twenty-four years of life into four periods or grades, to each of which he would assign a special school, thus:

I. For infancy	the school should be	the mother's knee.
II. For childhood		the vernacular school.
III. For boyhood		the Latin school or gymnasium.
IV. For youth		the university and travel.

A mother should exist in every house, a vernacular school in every hamlet and village, a gymnasium in every city, and a university in every kingdon or in every province. * * *

The mother school and the vernacular school embrace all the young of both sexes. The Latin school gives a more thorough education to those who aspire higher than the workshop; while the university trains up the teachers and the learned men of the future, that our churches, schools, and states may never lack suitable leaders.[4]

The plan outlined for education reads so much like the most thoughtful plans of modern days that one is tempted to quote beyond what is pertinent to the subject of the religious, and therefore important in the discussion of Sunday schools as now conducted. Passing by, however, all of the twenty-six paragraphs in the sketch of the mother

[1] The Great Didactic of Comenius, Englished by M. W. Keatinge, pp. 144-145.

[2] Idem, p. 129.

[3] Idem, p. 375.

[4] Idem, pp. 408-410.

school not explicitly religious, two must here suffice to show the preparation demanded at home before gathering in a formal school:

They will take their first lessons in music by learning easy hymns and psalms. This exercise should form part of their daily devotions.[1] * * *

Finally, by the time they are 6 years old boys should have made considerable progress in religion and piety; that is to say, they should have learned the heads of the catechism and the principles of Christianity, and should understand these and live up to them as far as their age permits.[2]

The vernacular school of Comenius would correspond in a general way to the public common schools of to-day in countries giving religious instruction in such schools.

The aim and object * * * should be to teach to all the young between the ages of 6 and 12 such things as will be of use to them throughout their whole lives. * * *

To learn by heart the greater part of the psalms and hymns that are used in the country. * * *

Besides the catechism, they should know the most important stories and verses in the Bible, and should be able to repeat them word by word. * * *

They should also learn the general history of the world, its creation, its fall, its redemption, and its preservation by God up to the present day.[3]

He would arrange these pupils in six classes, but it is unnecessary to follow the subdivisions, which suggest the grades below the high schools in this country.

The Moravians are numerically weak, but they exercise a relatively great moral power, especially as missionary laborers. A group of schools at Bethlehem, Pa., and one at Salem, N. C., represent their chief centers of concentrated effort in this country. The congregation at Bethlehem, the settlement of Count Zinzendorf, maintains a parochial school of high rank, established in 1742.

The Moravian Almanac and Year Book, London, 1896, gives the location, address of pastor, number of communicants and total membership, and number of scholars and teachers in the Sunday school for each church of the denomination, from which statements the following table is prepared:

Sunday schools, Moravian, 1895.

State.	Schools.	Teachers.	Scholars.

PRESBYTERIAN SUNDAY SCHOOLS.

The history of Sunday schools of the Lutherans and of the Moravians, as well as that of schools of the Calvinistic Presbyterians, of Hebrews, and of Catholics, has a double interest in the light thrown upon conditions in continental Europe while the new continent was being peopled and in the work which they have done in this country.

The Presbyterians have preserved something of the zeal for religious instruction impressed by Calvin directly in Switzerland, indirectly upon the Huguenots of France, and reformers in Holland, and through John Knox upon the Scotch and Scotch-Irish ancestors of Presbyterians in the United States.

The Westminster Catechism is widely used as a book of instruction among Presbyterians.

Presbyterian Church of the United States of America.—The minutes of the General Assembly of the Presbyterian Church in the United States of America, sometimes called Northern Presbyterian, give the membership for each school; a table of statistics of Sabbath schools; officers and teachers; scholars; officers and teachers and scholars; schools held all the year; in average attendance; scholars in full membership; scholars received during the year into full membership; taught in Shorter Catechism; using Westminster helps; books in library, and amount of contributions under four heads.

The following table is prepared from the table first described, arranging the data by States:

REFORMED CHURCH IN AMERICA, SUNDAY SCHOOLS.

The Reformed Church in America, colloquially called Dutch Reformed, is Calvinistic and related to the Presbyterian. There is a considerable membership of natives of Holland.

The committee of the General Synod of the Reformed Church in America upon Sunday schools and catechetical instruction[1] deems it essential that the Sunday schools shall be kept under the responsible control of the respective churches and not become distinct, independent organizations.

> In the mind of your committee, this question of consistorial supervision opens up the most important phase of the whole Sunday school problem, and touches a principle vital to the whole question of the relation of the Sunday school to the church. * * * Many pastors and consistories are seriously deprecating what seems to be a tendency in the trend of Sunday school development, through the influence of undenominational or interdenominational agencies—such as town, county, and State organizations, undenominational "helps"—to "institutionalize" the Sunday school. Whether or not the Sunday school is growing out of its normal position as an integral part of the church organism into the position of a rival to the church may fairly be questioned.

The committee also recognizes a demand for a return to the Bible pure and simple, without the lesson helps in general use. Of the churches with catechetical work, about two-thirds catechise in the Sunday school and one-third "catechise in catechetical class, the latter almost entirely in our Holland and German churches."

The Acts and Proceedings, 1896, just cited, show under each classis the number of Sunday schools and total enrollment, as well as number of catechumens for each church. The catechumens aggregate about 33,000, approaching one-third the enrollment in Sunday schools. There are no means of determining how far the catechumens are members of the Sunday schools, but they represent a specific effort at systematic religious instruction. The following table, by classes, is transcribed from the corresponding columns in the summary table of the book just mentioned.

[1] The Acts and Proceedings of the Nineteenth Regular Session of the General Synod of the Reformed Church in America, 1896.

REFORMED CHURCH IN THE UNITED STATES—SUNDAY SCHOOLS.

The Reformed Church in the United States, colloquially called German Reformed, is, like the preceding, of Presbyterian character. The Acts and Proceedings of the General Synod, Twelfth Triennial Sessions, 1896, give the Sunday schools, officers and teachers, and scholars for every church, as well as a statistical summary, from which the following table, by synods, is transcribed:

Sunday schools, Reformed Church in the United States, 1895.

Synod.	Schools.	Officers and teachers.	Scholars.

HOLLAND CHRISTIAN REFORMED CHURCH IN NORTH AMERICA—SUNDAY SCHOOLS.

The Holland Christian Reformed Church in North America carries suggestions of its history in its name. Many of the present pastors and members of the church in this country are natives of Holland.

The organization is strongest in the southwest part of Michigan. There are catechetical classes reported from churches that do not report Sunday schools, as well as Sunday schools where catechetical classes are not reported. The Year Book[1] of the church, under each classis, gives numerous particulars regarding each church, from which the following table is prepared:

Sunday schools, Holland Christian Reformed Church in North America, 1895.

Classis.	Schools.	Scholars.	Catechumens.
Hudson	7	1,003	650
Hackensack	8	888	.....

Total	72	9,344	8,700

CONGREGATIONAL [TRINITARIAN] SUNDAY SCHOOLS.

Congregationalism represents an intense independency, each church controlling its own affairs, yet there is such a habit of association that something like a denominational standard prevails, approaching a Trinitarian Presbyterianism with those called Orthodox Congregationalist in Massachusetts, and those of kindred views elsewhere, and of a different type from those under the name Unitarian. The peculiar geographical distribution will be evident in the table. The Congregational Year Book, 1896, gives under each State each Sunday school by name, name of superintendent, members, average, and families; independent and missionary schools by States, by name and membership. It will be noticed that officers and teachers and scholars are not separated.

BAPTIST SUNDAY SCHOOLS.

The great denomination of the Baptists, like the Congregational, is bound together more by the habit of association than by a recognized authority of any ecclesiastical body to control the individual church.

The American Baptist Year Book, 1896, gives by States the number of Sunday schools, of officers and teachers, and of pupils as follows:

Sunday schools, Baptist, 1895.

States and Territories.	Schools.	Officers and teachers.	Pupils.

PROTESTANT EPISCOPAL SUNDAY SCHOOLS.

In Episcopal Sunday schools courses of catechetical instruction upon the Bible, the doctrines, and the history of the church are prominent. The editions of catechisms are numerous, being often prepared with reference to the needs of individual dioceses. At Milwaukee the following combination is published as constituting "a graded course for the Christian year:" Church teaching for the little ones of the Church, by Emma Anderson Tew; the young churchman's catechism; a practical question book on the Bible for juvenile scholars; a catechism on the Christian year and the collects, including the church catechism; systematic Bible study for advanced classes—the last four by Miss L. L. Robinson.

The publisher states that—

> The five catechisms named above comprise a graded series for Sunday school children in the order named. Each is arranged in chapters for every Sunday in the Christian year.

Another combination of manuals of instruction for the children of the church is called the Maryland series. It consists of: I. A new first catechism. II. The gospel story, a second catechism for the little ones. III. The church catechism, from the Book of Common Prayer. IV. The creed, being an exposition of the faith of the Church as set forth in the Apostles' Creed. A new fourth catechism, by the Right Rev. William Paret, D. D., bishop of Maryland.

Other series, as Bible lessons for the Christian year, and lessons of the uniform system of the joint diocesan committee, claim a very large circulation.

A special church service for children is a regular appointment in many parishes.

The number of Sunday schools is not available, but the numbers of teachers and scholars of the Protestant Episcopal Church in the United States of America are shown in the following table, in which dioceses and missions have been rearranged to facilitate determining attendance by States: [1]

METHODIST EPISCOPAL SUNDAY SCHOOLS.

The founders of Methodism were from the Established Church of England, generally called, as organized in the United States, the Protestant Episcopal. The church has been prominent in Sunday school work in England and the United States from the days of its founders.

The Methodist kindergarten of the church has for its purpose "to introduce the principles of the kindergarten into the primary department of the Sunday school; also to recommend that there be five sessions for this department during the week in addition to the one on Sunday."[1]

Methodist Episcopal Church.—The following table of Sunday schools, by conferences, is taken from the Year Book of the church, sometimes called the Methodist Church North:

Sunday schools, Methodist Episcopal, 1895.

There are no data accessible for a satisfactory arrangement of the Sunday schools by States, but the scholars slightly outnumber the communicants or members of the Methodist Church at the census of 1890. The table of church membership by States, therefore, may roughly suggest the local strength of the Sunday schools. It is as follows:

Communicants or members, Methodist Episcopal, 1890.

States and Territories.	Communicants or members.	States and Territories.	Communicants or members.

[a] The Baltimore Conference includes Maryland, the District of Columbia, and part of Virginia. There are no available returns by which the numbers for each can be separated accurately. An estimate has been made for Maryland and, including the District of Columbia, the rest of the numbers for the conference have been combined with returns from conferences in Virginia.

UNITED BRETHREN IN CHRIST.

The United Brethren in Christ is a body of Methodist affiliations, including a considerable German membership, and is to be distinguished from the Unitas Fratrum (Unity of Brethren), or Moravians.

The United Brethren Year Book, 1896, gives statistics of Sunday schools by conferences, as shown below, without such detail as will enable one to make a definite table by States:

Sunday schools, United Brethren in Christ, 1895.

Total	3,519	34,826	243,483

Nearly one-fourth of the strength of these schools appears to be in Pennsylvania, a considerable representation in Virginia and West Virginia, a small part in Kentucky and Arkansas, a larger part in the Western Division, while the greater part is in the States of the North Central Division.

FRIENDS, FIRST-DAY OR BIBLE SCHOOLS.

The Friends or Quakers comprise two considerable bodies, known as Orthodox and Hicksite, besides lesser divisions.

Orthodox Friends.—The Orthodox Friends often designate their First-day schools as Bible schools or Scripture schools. There is no central summary for the church, but several of the yearly meetings composing the organization make reports, from which a partial and inadequate view of their work has been compiled. The reports of yearly meetings have not been fully available.

The minutes of the New York Yearly Meeting of Friends, 1896, contain a table of nine causes of success, of which the first is "Dependence on the written word of God, not upon helps." Consecration and preparation are repeatedly emphasized in the table. In a table of fifteen present needs of the schools are: A separate primary room; punctuality; reading matter suitable for young children; memorizing of Scripture by the children. Among eight "results of a year of hard work and earnest prayer" are: An increase of Bible study, a deepening in spiritual things; an improvement in the use of Bibles in the class, teacher and pupil bring their own, leaving helps at home; children learning to read the Bible daily at home; conversions; troublesome boys becoming much changed.

The minutes of the Ohio Yearly Meeting, 1896, mention that many Friends are in the daily practice of reading a portion of Scripture with their families collected, attended by a season of devotion.

The minutes of the Iowa Yearly Meeting, 1896, have a remarkable record in the relatively large numbers in Bible schools, and in the large proportion of families that have some defined religious home training, there being a membership of 11,124, an enrollment in Bible schools of 7,709, and 983 families that read the Scriptures with daily devotions.

In the minutes of the California Yearly Meeting, 1896, the superintendent of the Bible school department makes the suggestion:

> In the future let our work in this department be known as Bible school work rather than Sabbath school, the title to my mind being in every way as comprehensive, and more appropriate to the work we design accomplishing.

The Baltimore Yearly Meeting reports gain in Bible schools. The report of the Home Mission Committee contains the suggestion that—

> An invitation to join in Bible study at a private house will often meet with a grateful response and open the way for very definite work.

The report of the same committee contains the following item illustrating success in that direction:

> We have recently learned of a family belonging to our meeting who are living at a great distance from any other Friends, and some miles from any church building, whose interest in those living about them was so aroused by the spiritual need

that they opened their house on First-day morning for Bible school and meeting. At last accounts so many had responded to their invitations that the rooms of the house were too small to hold them, 75 people being present on one day.

The following table gives the partial returns received:

Sunday schools, First-day schools, Friends (orthodox), 1895.

a Not reported. *b* Average present at close of school. *c* Imperfect reports.

Hicksite Friends.—Among the Hicksite Friends the First-day schools are not all confined to Bible lessons, but they deal sometimes with ethical or humanitarian subjects.[1]

The Proceedings of the twentieth session of the First-day school general conference, held at Swarthmore College August 19–20, 1896, contain discussions and statistics of the work as done among that body of Friends known as Hicksite, reported in the last census as having in round numbers 22,000 members.

The schools generally use lesson leaves prepared by a literature committee. In the past four years the Gospels, Acts, and Romans have been the subjects of study, and it is proposed to continue with the Epistles till the next general conference (1899). Old Testament studies are under consideration. A Book of Devotional Poems and Selections from Whittier's Poems are considerably used.

The conference was marked by an earnest, hearty attention to the subjects in hand, with a minimum of incidental adjuncts. Cornelia J. Shoemaker took the leading part on First-day school extension. She said:

> Much would be accomplished in many of our First-day schools by better classification, and through the recognition of this pedagogical law that the same truth is not food for children of all ages. * * * In the child we see the type of the race. His narrowed horizon shuts out from view the truth we fain would teach, until a simpler lesson lifts him to that height from which it can be seen.
>
> The work for our smallest classes should be that most easily comprehended. Stories from the Old Testament, interspersed with lessons drawn from daily life and illustrated by means of those indispensable adjuncts to all school work, the

[1] One book so used is American Charities: A Study in Philanthropy and Economics, by Amos G. Warner. 1895. 12°, pp. 8 + 430.

blackboard and crayon, might prove helpful to the very little ones. From Old Testament stories they might pass to New Testament biography. * * *

A course in Bible history, or the growth of Israel's national life, in which might be noted the radical characteristics and unusual environment which had so marked an effect upon the development of its peculiar genius, should follow.

In connection it would be profitable to study the bibles of the so-called pagan world. Not to the Jews alone did the Great Soul of the Universe reveal Himself. His divine hand as surely guided the thought and destiny of every race. * * *

To know our own Bible truly we must know those of other lands.

The last years in the First-day school could be devoted to New Testament history and the study of the books of the Bible in the order of their birth. Thus by connected reading the message of each book will be made clear, and the student will realize as never before the incalculable debt which literature, art, and ethics owe to this library of the past.

This speaker advocated adult classes among work people like those of Friends in England, explained later by John William Graham.

The committee from the Baltimore Yearly Meeting said in its report:

In all of our meetings there are first-day schools where the older members with the younger join in sincere and zealous efforts to find the truths of religion as initiated by Christ in His wonderful Sermon on the Mount.

Positive denominational teaching is favored. "All of our schools use the 'Friends' Scripture Lessons,' and 'Illustrated Lesson Leaves,' and satisfaction with them appears to prevail," with a reservation as to their adaptation to infant classes.

William M. Jackson expressed his pleasure that the Baltimore schools taught the doctrines of the Society of Friends. He defined

the one distinctive doctrine * * * that there is to-day, as there ever was, an intercommunication of the Divine with the human spirit and that what Friends call the Light within is the revelation of God in the human heart.

The report from New York had a special feature: "In circulation among the country schools eight traveling libraries, containing 339 volumes." Edward B. Rawson said:

We appropriate a small sum every year to the use of the library committee. The committee fits out libraries of about fifty volumes each, boxes them up and sends them off to the First-day schools expressing a desire for them. When these First-day schools have read the books and gotten all they can out of them they are sent on to some other First-day school. Each year we put a few more books in circulation.

The report from Indiana elicited from John H. Shotwell:

That part of the report that struck me most forcibly was the penny collection for the use of the library, enforcing the importance of giving to religious works.

In the discussion, "How shall we better qualify ourselves for First-day school teaching?" Frances M. Robinson said:

In determining how we may better qualify ourselves for the work we must first have a distinct and definite idea of what we shall try to accomplish. The proper work of the First-day school may be embraced under three heads:

First. To give a knowledge of the Bible, its contents, its authoritativeness, its intent, and its rightful influence.

Second. To present and explain our principles and testimonies, the source from which derived, the circumstances which gave them birth, their reasonableness and sufficiency.

Third. To inspire devotion and conservation of life. To impress upon every heart the necessity for working out its soul's salvation with fear and trembling before God.

William W. Birdsall, indorsing Frances M. Robinson's presentation of the subject and her plea for study of the Bible and books showing the Friends' doctrines, would make her third purpose of the school first in order—

The one great purpose of the First-day school—to instill devotion and conservation of life, to teach the child its relation to God and its duty toward God. And as a means to that end, and not as a purpose in itself, to give to the child a knowledge of the Bible and its contents, its sources and its rightful influence.

Books named by the last two quoted were: Summary of Christian Doctrines as held by the Religious Society of Friends, by Samuel M. Janney; Religious Views of the Society of Friends, by Howard M. Jenkins—both very small books; Quaker Strongholds, by Caroline Stevens; Quaker Ideals, by Francis Frith.

John William Graham spoke upon adult schools in England of interest here in the possibilities of their reproduction in the United States. He said:

The English adult class is primarily a Bible class for workingmen, i. e., a mission class held generally early on First-day morning, taught by some man of good education and standing, but self-governed and essentially cooperative or democratic in its forms. There are also women's classes taught by women, and mixed classes.

This bold and simple description is almost all that can be said to be universally true about these schools, for variety is of their essence, and elasticity is the only rule of their practice. There is also only one marked characteristic of the spirit of them all, and that is brotherliness. * * * There are many imperfect teachers, speaking intellectually, among us, but there is one invariable and necessary characteristic of the successful worker, and that is an easy manner, a ready handshake, and a friendly, affable way with you. * * * Almost every additional quality that we may possess comes in useful, for the schools have developed in all sorts of directions from the original Bible class. There are savings banks, libraries, sick funds, Saturday afternoon rambles, holidays away together in the summer, fishing clubs, football clubs, microscopic clubs. There are tea parties and social evenings and debating societies. In some cases there are prayer meetings, mission meetings, and temperance meetings. There is everything that the cooperative spirit of man can devise for his comfort when once he gets into friendly relations with his fellows. * * *

Originally the movement, when begun fifty years ago, dealt with the most degraded men who could be found. Reading and writing were the bribe held out to those who would consent to come to the Scripture lesson, but we have now had in England nearly a generation of complete public schools, and reading and writing are dropped as no longer needed.

In my own class we do not confine ourselves to the Bible for subjects. We utilize all that is excellent and of good report. There is nothing I am personally so fond of as going exegetically through an epistle of Paul. We once spent four years over the life of Jesus. We treat all biblical matters with the best knowledge we can obtain from biblical critics. We have had lessons on Buddhism and

Mohammedanism, on the lives of many great men, recently on Mazzini and John Woolman, and on current moral and social questions. * * * I am accustomed to give a lesson for half an hour to discussion, and lively times we have * * * but evincing thought and interest, and capable after all contradictions of being judiciously guided to an amicable settlement. * * * We conclude with a short devotional pause.

He stated that in Birmingham 10,000 men—4,000 in the Friends' schools, from which the others have copied—gathered at from 7 to 8.50 a. m. for their schools.

Other classes are quite different from my own. They are often extremely evangelical in tone, and inquiry is not tolerated out of the beaten track. In fact, every teacher does what he thinks is right, and attracts his own sort of men.

In reply to a question whether the Friends in England had First-day schools among their own members, Mr. Graham said:

We rely entirely upon home teaching for that. We have none whatever.

At an evening meeting in the Friends' religious conference Mr. Graham spoke upon "Three needs of the church."

I. * * * The need of consecration to aggressive work. * * *
II. * * * The service of the ministry. * * *
III. * * * There is not enough living, modern knowledge of the Bible among your ministry as it is. * * *

I therefore plead with you to read the Bible more and study it more. In England we Friends all read it twice a day in our families, and at our schools we learn off quite a considerable fraction of the New Testament.

He commended the attention given to biblical study in the original languages at Bryn Mawr College (orthodox) and urged its adoption at Swarthmore (Hicksite) as an aid to general biblical education and influence upon First-day schools.

The following are the statements of enrollment as reported at the Swarthmore conferences:

First-day schools. Friends (Hicksite), 1896.

CONSOLIDATED STATEMENT OF SUNDAY SCHOOLS IN CERTAIN DENOMINATIONS, 1896.

There are various denominations whose statements for Sunday schools have not been available. The Methodist Yearbook, 1896, gives numbers for certain branches of the churches, without details. Including these with those already named, the following table has been made:

Sunday schools reported by certain denominations presumed to be included in the International Sunday School Convention table, 1895.

Denomination.	Schools.	Officers and teachers.	Scholars.
Baptist	22,776	162,298	1,558,315
Congregational [Trinitarian]	4,925	.....	*a* 682,580
Independent	1,541	.....	71,857
Evangelical Association	1,640	19,082	95,256
Evangelical Lutheran	4,915	49,813	445,696
Friends:			
Orthodox *b*	672	2,150	48,374
Hicksite	151	1,138	8,796
German Evangelical Synods of North America *c*	.....	8,694	82,628
Holland Christian Reformed	72	.....	9,344
Methodist Episcopal	20,585	337,162	2,405,975
Methodist Episcopal South	13,604	99,144	813,555
African Methodist Episcopal Zion *d*	2,175	13,145	108,820

a Members.
b Imperfect reports.
c Evangelischer Kalender, 1896, St. Louis, Mo.; also 18,000 in parochial schools.
d This and the following entries of Methodist connection are from the Methodist Yearbook, 1896, as given, without detail. The figures for certain important branches are not given.

Sunday schools reported by certain denominations, etc.—Continued.

Denomination.	Schools.	Officers and teachers.	Scholars.
African Union Methodist Protestant	350	900	2,770
Colored Methodist Episcopal Church in America	4,007	7,098	79,876

United Brethren in Christ	3,519	34,826	243,482
United Evangelical Church	650	b,758	66,158
Universalist	654	.....	c56,028
Total, as thus reported	103,785	956,142	8,747,859

a Total enrollment.
b Returns defective, some States and parts of States omitting this item.
c Members.

The totals in the above have very little value, from the want of uniformity in the manner of reporting and from the omissions in the reports.

INTERNATIONAL SUNDAY SCHOOL CONVENTION.

The International Sunday School Convention includes in its statistics what are called Protestant and Evangelical schools. Although certain denominations are strongly represented in the convention, it would hardly be strictly correct to say that they were all officially represented. It occurs that Sunday schools and local associations of Sunday schools send delegates to the international convention, and that the authorities of some denominations so far follow the decisions of the convention as to use its Scripture selections for lessons, but individual denominations, or special interests within a denomination, put forth their own lesson helps or comments, and many schools and some denominations pay small heed to the lesson schemes marked out by the international committee.

The statistics already given are presumably included in the table put forth by the Eighth International Sunday School Convention, as are also the facts regarding some denominations that have not been available in separate form. The international reports of the Sunday schools are made up for areas, as towns, cities, counties, States, and it is not easy to determine just what was included in each case.

In pages immediately following are given extracts from the proceedings of the Eighth International Sunday School Convention, Boston, Mass., June 23–26, 1896, indicating something of the views presented and the decisions of the association.

George C. Lorimer, D. D., Boston, Mass., in the course of an

extended address, plead for more definite study of the Bible itself, saying:

I don't think any teacher has the right to take before his Sunday school class a "lesson help" of any shape or kind. I have been pained when during the past winter I have visited many Sunday schools to see so many teachers standing with the Bible shut and a lesson paper on the back of it, trying to teach the class. You are thereby missing the prime object of the Sunday school, which is not to teach the specific opinions stated in a Sunday school helper, but is to inspire the youth with the profoundest reverence for the Word of God.

Another thing I have noticed. Apart from the use of helps in such classes, how little effort was made, is being made, to memorize the Word of God. * * *

Born an Episcopalian and bred an Episcopalian, from that I drifted into a Baptist Sunday school. I believe that my whole future was determined by that Sunday school. And why? First of all we were taught, and especially taught, to memorize God's Word. You know that what comes to you in early life, almost unconsciously, will color your actions afterwards. I studied, I memorized and repeated, and I could repeat to-day the whole Gospel of St. John from the beginning to the end. I won a prize on the Psalms of David, and all the critics of the world, somehow, can not convince me that David did not write the Psalms.

William Reynolds, field superintendent, outlined the work of the international organization, making the following statements regarding its work in this country:

The teaching of God's Word is left almost entirely to the Sunday school. Comparatively little is done in Christian homes, and none in our public schools or other secular educational institutions. If, therefore, the children and youth of this present generation are to be "rooted and grounded" in God's Word, it must be in the Sabbath schools of our land. Hence the necessity of better schools, better facilities, better management, and better teaching. * * *

Factors in the improvement.—1. Perfected organization. In order that improved methods may be made known to the schools and workers, it is necessary that a complete chain of organization be maintained from the international committee to the individual teacher. Therefore we have this international meeting every three years, composed of delegates from each State. * * * Once a year we have the State * * * convention, composed of delegates from each county in the State or province. Next comes the county convention, composed of delegates from each township or district in the county. And last we have the township convention, that embraces every Sunday school officer and teacher within its boundary. The township overlooks the work in its limits, the county in its entirety, and the State in its domain. The international organization is the watchtower, from which we overlook the whole field.

2. Normal classes. A great advance has been made in the widespread establishment of normal classes for training and developing better teachers. No permanent improvement can be made in our schools until our teaching reaches a higher standard and we copy more closely the one Model Teacher. Never man taught like this Man. * * *

3. Cooperation of public educators. * * *

4. Young people's societies. * * *

5. House-to-house visitation. * * *

6. Home-class department. * * * The advance along this line is most encouraging. It is believed by many of the foremost Sabbath-school workers of America to be the best thing adopted in Sabbath-school work since the international system of lessons was introduced twenty-four years ago. * * *

7. Publications. Perhaps no factor has done more for our work along all lines than the development and increase of publications devoted exclusively to Sunday-school work. We refer with pride and gratitude to the two leading publications, the International Evangel and the Sunday-School Times. * * *

I thought it might be of interest to give you the names of all the State * * * Sunday-school papers, and also names of States * * * in whose interest they are published.

State * * * *Sunday-school papers.*—Arizona, the Independent; Connecticut, Connecticut Sunday School Record; Florida and Georgia, the Southern Chautauqua Journal; Illinois, the Trumpet Call; Indiana, the Awakener; Iowa, Iowa Sunday School Helper; Kansas, Kansas Sunday School Journal; Kentucky, Kentucky Sunday School Union; Maine, Sunday School Reporter; Maryland, the Field Record; Massachusetts, Massachusetts Sunday School Record; Michigan, Sunday School Advance; Minnesota, Special Edition Evangel; Missouri, Special Edition Evangel; New York, Sunday School at Work; New Jersey, New Jersey Sunday School Messenger; North Dakota, Special Edition Evangel; Ohio, Ohio Sunday School Worker; Oklahoma Territory, Oklahoma Sunday School Worker; Oregon, Oregon Sunday School Tidings; Pennsylvania, the Sunday School Herald; South Carolina, Sunday School Trumpet; South Dakota, Special Edition Evangel; Tennessee, the Tennessee Sunday School Worker; Wisconsin, the Christian Union.[1] * * *

The following States * * * are counted as "Banner States" * * *—that is, every county is organized and holds a convention at least once a year:

Connecticut, New Jersey, Illinois, Missouri, * * * Massachusetts, Kansas, Delaware, New York, Vermont, Indiana, Rhode Island, Ohio, Maine, Maryland, Iowa, New Hampshire.

The following States, * * * while not Banner States, are well organized, and I prophesy will ere long be Banner States:

California, Louisiana, Alabama, Nebraska, Oklahoma, Georgia, Michigan, Mississippi, Oregon, Tennessee, Kentucky, Minnesota, Montana, Pennsylvania. * * *

The following are not organized: Alaska, Idaho, Nevada.

The other States have organizations more or less efficient. When we can lend them more assistance, they will soon develop into well-organized States.

The States needing special help are Arkansas, Nevada, North Dakota, Virginia, Wisconsin, Colorado, New Mexico, South Dakota, Washington, Wyoming, Idaho, North Carolina, Texas, West Virginia. * * *

The States that have made the greatest progress during the past three years are Pennsylvania, in organization; Iowa, in ingathering; New York, in home class work, and Illinois and Missouri in normal work. Oklahoma Territory has a phenomenal increase owing to her peculiar conditions as a Territory.

The States * * * employing paid workers are as follows:

Connecticut employs 1; District of Columbia, 1; Florida, 2; Illinois, 6; Massachusetts, 3; Missouri, 2; Indiana, 2; Iowa, 1; Kansas, 1; Kentucky, 3; Louisiana, 1; Maine, 1; Maryland, 2; Nebraska, 1; Oklahoma, 1; Michigan, 1; Minnesota, 1; New Hampshire and Vermont, 1; New Jersey, 2; New York, 10; Ohio, 3; Pennsylvania, 3; Rhode Island, 1; South Carolina, 1; Texas, 1. * * *

---

[1] This does not include journals under denominational auspices, nor all private publications, either with chief reference to lessons or for circulation among children. A list of children's papers is given under the subject of "Libraries," on a later page.

S. B. Capen, president of the convention, defined the work of the Sunday school thus:

Let me say, first, that next to the home the Sunday school is the mightiest force for righteousness in our land, because it is touching most effectively the young life of the nation. * * *

It has been said that the teachings of what was commonly called the "three R's—Reading, 'Riting, 'Rithmetic—is not enough; there must be a fourth R, Righteousness," and this is the special mission of the Sunday school.

H. M. Hamill, field worker, reported of work in the South. The imperfection of records which he names is not peculiar to the South. He said in the course of his report:

There are many signs of advance along the lines of the most approved and modern Sunday-school work. City Sunday-school unions are springing up in the larger cities. * * * The best modern Sunday-school architecture is being introduced. Conveniently constructed and equipped Sunday-school buildings are taking the place of the old. * * * Maps, blackboards, charts, the best appliances and literature are in demand. The grading and classification of schools, their better management, the training of teachers, are chief topics of the Southern Sunday-school publications. * * *

The statistical reports of the Southern Sunday-school work, I am sure, are imperfect and incomplete. The fault is not with the workers, but with the condition of the work, which, with rare exceptions, has not reached that stage of progress that secures full and complete statistical exhibits. There is such a large, unorganized, and undrilled territory in the South that a just exhibit of its real Sunday-school strength will for years to come be lacking. If the figures of the denominational boards and secretaries could be secured, it would give a truer statement than we now have from the meager returns of the State and county officers. The relative strength of the white and black Sunday-school enrollment and of that larger element not counted of both whites and blacks is an unknown quantity in most of the Southern States. I am sure that the present estimates do not give justice to the real statistical status of the South. * * *

The most serious problem of Southern Sunday-school work is the problem of the blacks. How many millions of these are in or out of Sunday schools no man knows, but in the answer to that question every man North and South is vitally interested. The known conditions are ground for our most serious and anxious thought. I do not believe that this problem, with all that is involved in it, can be clearly understood except by those whom it most immediately concerns and by those who in the spirit of Christ are looking upon it face to face. I believe that the Southern people, especially the Southern white churches, have been misunderstood, and that there is a far kinder feeling between the two races and a stronger desire to aid in the solution of the problem than is commonly supposed to exist. I believe that there are many thousands in the South whose cradles, like my own, were rocked by the hands of slaves who look upon the black man with genuine sympathy and brotherly love and would gladly aid in any movement that would open the doors of the gospel to him and his children. Already a strong movement on the part of the white churches of the South has begun, and is daily gaining strength. But the harvest is great and the laborers far too few. The white churches for most of the generation that has passed since the war have been battling against their own poverty, and could not carry forward the great and needed work among the blacks. The blacks are waiting to be led. One of the pathetic sights of the Southland to me is the universal desire of the blacks to have churches and Sunday schools for themselves and their little ones. After five

years of international service in the South and a thorough acquaintance with the white and black leaders, I am justified in saying that the white Christians are anxious to help in the evangelization of the negro.

B. F. Jacobs, as chairman of the executive committee, said:

A resolution was adopted expressing strong preference for one lesson only for the whole school, with a suggestion to the lesson committee as to an optional course for primary classes if the lesson committee decide to try the plan. * * *

Field workers, missionaries, and secretaries are now employed in twenty-three States and the District of Columbia. * * *

Confessedly, our greatest need to-day is qualified teachers of little children. The kindergarten movement is gathering force and old methods of teaching are giving place to new. This must be true in Sunday-school work, and our primary-class teachers are now the most importunate pleaders for help. In six States and one province a qualified primary teacher is now employed as a State worker, and primary unions are being formed in our cities and larger towns. In New Jersey a ten days' institute for primary-class workers was attended by 175 persons, and the plans for this year cover twenty days, and an attendance of 300 is expected. The total number of primary unions reported is 102, as follows: In California, 1; Colorado, 2; Connecticut, 2; District of Columbia, 1; Illinois, 2; Indiana, 1; Kentucky, 6; Maine, 3; Massachusetts, 24; Michigan, 1; Minnesota, 2; Missouri, 7; New Jersey, 15; New York, 8; Ohio, 6; Oregon, 1; Pennsylvania, 16; South Carolina, 1; Tennessee, 1; Wisconsin, 1, Wyoming, 1. * * *

The International Sunday-school lessons.—This convention has a most important work to do. It will choose a new lesson committee who are to select the lessons which are to be studied during the closing years of this century and the first five years of the twentieth century. It is probable that changes will occur in the committee, and it is almost certain that the plan will be continued. The agitation of the question and opposition to the plan has failed to remove it from the place it has long occupied in the minds and hearts of Sunday-school workers. Even the urgent demand upon the part of the few for a separate course for the primary department has less support now than it had a year or two ago.

John Wanamaker made strong claims for the preeminent office of the Sunday school:

The influence exercised by the Sunday school, where it has had proper development, has been so beneficial and far-reaching that, over and above any other religious agency, it is believed by many to come the nearest to answering the greatest need of the human race at the present hour. For the reason, first, that no other school exists which is conducted systematically and continuously for teaching the one Book containing God's revelation of himself and the rule for His children's lives. Second, it is the only school organized to teach the Bible at the most teachable age; to inform the mind, influence the heart, and mold the life in the highest principles of unselfishness and uprightness in the fear of God and love for our fellow-men. * * *

Since the uniform lessons were introduced, with the accompanying literature upon lessons and management, the past twenty years have registered fifty years' growth by the advance that has been made in perfecting the system. * * *

It is not a fad or fashion, the plaything of unemployed laymen or the pastime of leisure-blest women. It is not independent of, but an approved agency of the universal church, sanctioned by the highest church courts and under the control of pastors, rectors, elders, deacons, and vestries. Neither is it a mere incident of the church. It often exists on the outskirts of cities where there is no church, and in all new regions invariably precedes the establishment of the church.

In the newer States of this country the Sunday school is frequently the pioneer of the settlement, the only social center in the township, the only public moral center, providing the only library in the neighborhood, the only book center, the only music center, the only post-office distributing generally any printed matter, the mother of the church. Few can ever know how large a part the little cross-roads Sunday school had in allaying the discontents and loneliness of the first homes of the early settlers. In the cities it must not be supposed that the excellent college settlement work of the present time is a new discovery. It is only the old mission Sunday school under a new name. The old-time mission schools did precisely the same kind of work throughout the week days as the college settlements, with the teaching of the Bible on Sundays in addition.

Rev. C. R. Blackall, a writer of Sunday-school lessons, said:

It must be admitted that the Sunday school has not kept up the standards of pedagogics that are certainly essential to the best success. The work being voluntary, the teaching material in great part untrained and inefficient and the limitations and hindrances numerous, the results are not what they might be under more favorable conditions.

The report of the lesson committee, Warren Randolph, D. D., chairman, shows that—

In 1872 began the system of uniform international lessons, arranged first in courses requiring seven years and in 1893 to require six years. In 1893 there was an emphatic expression of the convention for "one lesson for all." There had never been a divided opinion in the lesson committee as to the wisdom of the plan of uniformity adopted at the beginning, and they felt confirmed by the vote of the convention; but in 1894, when that committee met, they were embarrassed by an earnest appeal from influential workers for a separate course of lessons for primary classes. The committee still judging a uniform course best, was willing to try to meet the wishes expressed, and prepared a special primary lesson list, which they submitted for instructions. They also submitted the question of a special temperance lesson quarterly.

The next two speakers condemned current methods, Mr. Patterson Dubois saying that "the secular school is ahead" of the Sunday school in its recognition of "the germinal fact of the child as the primary principle," and Margaret C. Brown pleading for conformity in the Sunday schools to the principles of Froebel.

W. D. Pearce said:

Three of the greatest hindrances to Sunday-school management are: (1) Lack of regular and punctual attendance; (2) lack of lesson preparation; (3) lack of systematic giving.

Nehemiah Boynton, D. D., said:

The one thought which * * * I wish to lay upon your minds and hearts here and now is this, that the essential of a Sunday-school teacher after all is simply spiritual preparation. It is magnificent to have all the equipments with which to do our Sunday-school work. * * * It is splendid to be an accomplished student in the work of God, to understand all the niceties of that magnificent book, to see the continuity of history springing in Genesis and finding its splendid culmination over in the Book of Revelation. But there is something better than that. The teacher who has the equipment and the teacher who has the knowledge, but who has not the spiritual preparation in his own life and the spiritual aspiration in his own soul, will never lead the boys and girls very near to

the beautiful gates, with all his magnificent equipment and with all his marvelous erudition. Now, that is a thought of great comfort for those of us, who as Sunday-school teachers realize our defects and deficiencies as we come to our boys and girls. It is a great comfort to us to understand that we can be great and towering in our Christian success if only we will school and discipline and develop our own lives according to the principles of the Gospel of Jesus Christ our Lord. For a great Christian will be a great Sunday-school teacher, even though that Christian be unable to read or to know the letters of the alphabet, because that Christian will have the practical experience out of which to develop the souls put into his care and keeping.

The following was among recommendations adopted, as was also the resolution succeeding:

That as the crying need of our Sunday schools is trained teachers we strongly urge weekly meetings in each school for the study of the lesson; institutes for groups of schools for the study of the Bible and of methods of instruction; that in our colleges and seminaries special courses in Bible study and teacher training be provided for the ministers and Christian workers of the church as vital to this progress, and that we approve of the recognition of all graduates in a normal course of study by the State and provincial associations. * * *

Resolved, That this convention reaffirms its belief in the uniform system of international lessons as the best yet devised, and hereby pledges its loyal support.

The statements of speakers at the Boston convention regarding the imperfection of records, for instance those of Mr. Hamill, are to be kept in mind in estimating the value of the tables. In this matter, as in many others of public report, the original records are defective, and no compiler can bring together a series of ultimate accuracy, since so much of the foundation is only estimate. In the statement of attendance put forth by the association the individual responsible for each State report is named, and the dependence one can place in each case can be judged by those best acquainted with the conditions in that case.

With the limitations mentioned, the following table represents the numerical strength of the Sunday school of Protestant Evangelical connection recognized by the International Sunday School Convention.[1]

[1] See note at end of report on Sunday schools.

[*Protestant Evangelical*] *Sunday school statistics for the United States.*

1896	132,097	1,394,630	10,893,523	12,288,153

THE HOME DEPARTMENT, SUNDAY SCHOOLS.

It would not be safe to say that no Sunday schools return those in the home department in their general statistics of attendance, but it is so far customary to report the home department separately that it represents a large addition to the work done in the Sunday-school rooms.

The home work is reported to be especially important in its results in the South, opening up an additional opportunity for education and developing family influences in a rapidly increasing degree. In recent addresses, Rev. L. B. Maxwell, agent of the International Association for work among the negroes, has pointed out that when adults have pledged themselves to study the lesson for at least thirty minutes each week their interest leads them to spend more time, and that where the parents interested can not read they have their children read to them, so that whole families study together, the children meantime gaining in general training. The system of visitors also develops social life in a wholesome way, so that there is a building up of higher civilization. This forms one of the bright spots in a work that in the nation at large is open to much criticism.

The method of management and the enrollment are taken from the report made by W. A. Duncan, Ph. D., at the Eighth International Sunday School Convention (1896), as follows:

Methods and organization.—The method of operation is that of the University Extension movement and the Chautauqua Literary and Scientific Circle, for in both of these credit is given for work done away from college or schoolroom, whether it be accomplished by individuals or in class work. One of the first things to do is to look over your church roll and mark every person who does not attend your Bible school. Then take the list of scholars and see how many of their parents are not members of the church or of the school. Then make a complete canvass of the whole parish, neighborhood, or town, especially of the children of school age, between 5 and 21, first urging every one as you make the canvass to attend the main school. Then revise and combine these lists into one, and this will be your field for introducing the study of the Bible into the home. After you have made out this list call together those you think will be interested in estab-

lishing a home department. Then select ten or twenty active workers, call them together in your study and talk the matter over, and show them the number of persons who are not studying the Bible. Say to one, for example, "Here are ten people living in your neighborhood. Will you take care of them?" She agrees to do so, and you assign another ten to a second worker, and another to a third, and so on, until you have portioned out the one hundred and fifty or more people who are not studying the Bible systematically. You call these fifteen or twenty people your visitors. These visitors go to the people with a pledge card, on which is printed: "I promise to study the regular Sunday-school lesson half an hour each week." These cards are signed, and the names are enrolled as members of your school, each visitor and her students constituting a class. You may use the card or not; you may send these visitors out to explain the system by word of mouth, or you may have a little circular printed. After securing the members send for your extra Sunday-school quarterlies, then call your visitors together and divide the quarterlies among them, giving in connection with each a record card or envelope on which every student can keep the record of lesson study and contributions for three months.

The visitors go out with these quarterlies and record cards about the 25th of December, leaving them in the various homes. Then about the 25th of March they go out again and gather up the record cards, leaving new quarterlies and cards, speaking a word of encouragement, and seeking to remove any hindrances or difficulties that may exist. These records are brought back to the secretary of your Sunday school and he enters them in the secretary's book.

The home department should not be made a separate organization, but should be considered as holding the same relation to the Sunday school as the primary or intermediate departments. At the end of the next quarter do the same thing. Some will fall out, others will join; but persist in the work. Let the pastor preach a sermon on the subject; use your library; let the department be recognized in your prayer meeting; let it be an essential part of your work; persist in it and you will find that the results will pay. * * *

SUMMARY OF REPORTS.

Sunday school home departments in the United States.

States and Territories.	Departments.	Visitors.	Members.	Total.	Remarks.

Colorado	50	.....	.....	2,400	Do.
North and South Dakota	100	.....	.....	4,000	Do.

HEBREW SABBATH SCHOOLS.

No matter what may be one's personal religious views, he can not properly study the full subject of Sunday schools if he does not examine them on the broad basis of their community of avowed religious purpose. Every organization based on religious convictions must maintain itself in accord with mental and moral laws. Whatever differences of private opinion may exist, every successful teacher must have a quality or a method that has some interest to other persons interested in education. This will require the study of schools not included in the statistics of the International Sunday School Association, namely, those of the Roman Catholics, the Unitarians, the Latter Day Saints, all accepting the same Bible as a sacred book; those of the Hebrews, who accept the Old Testament only, and those of some minor bodies, not at this date available, whenever their conditions are evident.

The reports of Hebrew Sabbath schools may be studied to great advantage, especially if one will observe how far they would apply were the word "Hebrew" dropped and the name of any other group that uses the Hebrew scriptures substituted.

The information as to Hebrew Sabbath schools in this country has been partly obtained through the courtesy of Dr. David Philipson, president of the Hebrew Sabbath School Union of America. Returns are not regarded as complete, many schools failing to reply when the figures were collected, which was in 1889. The published reports of the Union of American Hebrew Congregations have been freely utilized.

The schools have sessions on Sunday morning from 9 o'clock to 11 or 11.30. Some have an additional session on Saturday from 9 to 10 a. m. The rabbi is the superintendent. Where there is no rabbi, as is the case in some very small congregations, a layman has charge of the school. In quite a number of congregations there are what are known as post-communion classes, consisting of the young people who have been confirmed, usually under the personal charge of the rabbi.

It is not easy to make an accurate statement regarding the Jews in this country. There are many Jews not identified with any congregation. Each congregation is a voluntary association governed by its own rules and responsible to no other except through its own pledges.

In 1872 Jews at Cincinnati made an effort "with a view to form a union of congregations, the object of which should be: First, to establish a Jewish theological faculty; second, to publish proper books for our Sabbath schools; third, to adopt a code of laws defining Judaism." The following was published under date of May 18, 1873, in the Jewish papers of Cincinnati:

Owing to the difficulty experienced in obtaining the names of the numerous congregations in the West and South, the committee has been unable to address the call to all whom it was desired to reach. We therefore republish it, and trust

that each Jewish congregation, from the Alleghanies to the Pacific and from the Lakes to the Gulf, will consider the call hereunto annexed as if directed to itself, and all those who have not done so will respond by electing delegates in accordance therewith at as early a day as possible.

The committee charged with the call had been able to obtain the address and location of about one hundred congregations. Out of this movement grew the Union of American Hebrew Congregations; the organization of the Hebrew Union College in Cincinnati, Ohio, embracing three departments, viz, preparatory, Hebrew classical, and Rabbinical; and the Hebrew Sabbath School Union. To enter the schools preparatory to the college, one must be a student or graduate of a high school or college; for the Hebrew classical, the candidate must be a graduate of the preparatory or a student of a high school or college, and in the rabbinical department the candidate must be a graduate of the Hebrew classical and of a university or college. The graduates of the last department receive the degree of doctor of divinity as qualified for the ministry. Prizes were offered for the best biblical history, the best post-biblical history, and the best catechism, to make the Sabbath school work more efficient.

The scope of the organization was extended by a resolution to "invite every Hebrew congregation in the United States and its Territories to join the union." So much was initiated before 1875. At the meeting of 1875 the president of the council delivered an address, in which he said:

The fundamental cause of all misfortune, be it individual, in the family, the State, or the nation, can be directly traced to disregard of the ten commandments. The ten commandments are to human affairs what dew, rain, and sunshine are to the vegetable kingdom. * * *

There are signs * * * that Israel is growing careless of its religion. The young men are not joining the congregations. Perhaps it is because the old are beginning to disregard the Sabbath as a day of rest, as a day devoted to God and the family, divinely given for mental elevation and advancement.

This second council initiated a supply of a translation of the Hebrew Scriptures, the Old Testament of the Christian, so that they might be sold at a low uniform price in all congregations. This translation is known as Leeser's Bible, from Isaac Leeser, the translator.

At the third council (1876) the Biblical History of Rev. D. T. Deutsch, of Hartford, Conn., was recommended as the best existing text-book of its kind. A book written in the German language was recommended as the best text-book for post-biblical history, namely, Dr. Cassel's Leitfaden für den Unterricht in der Jüdischen Geschichte.

The following statement is abbreviated from the constitution as revised in 1878:

It is the primary object of the Union of American Hebrew Congregations to establish a Hebrew theological institute; * * * to establish, sustain, and govern a seat of learning for Jewish religion and literature; to provide for and

advance the standard of Sabbath schools for the instruction of the young in Israel's religion and history and the Hebrew language; to aid and encourage young congregations; * * * to provide, sustain, and manage such other institutions which the common welfare and progress of Judaism shall require—without, however, interfering in any manner whatsoever with the affairs and management of any congregation.

In 1878 a prize was offered for the best hymn book for Sabbath schools.

As the culmination of an effort pursued during the previous two years to collect statistics, the report of 1878 shows 223 congregations, 12,030 members (heads of families, apparently), and 12,674 scholars receiving religious instruction under 652 teachers. The number of Jews residing in the United States so far as heard from reached 227,528, and it was estimated that 250,000 would include the whole Jewish population.

There had been an organization known as the Board of Delegates of American Israelites. A noteworthy incident of the sixth council of the Union of American Hebrew Congregations (1879) was the merging of the board of delegates in the union and the presentation of a statistical report whose summary varied little from that of the previous year. The following extracts are from the proceedings of this (sixth) council:

Tuition in the Hebrew Union College is free to all, without religious test and without registering fees. The hours of tuition are from 4 to 6 p. m. daily, which will not interfere with the secular studies, they being from 8 a. m. until 2 p. m. daily. * * *

The branches of study comprise—

(1) The Bible in the original; the Targumim, and the most important commentaries.

(2) Tradition: (*a*) The Talmud; (*b*) Midrash; (*c*) Casuistic literature.

(3) History of Israel, its doctrines and customs.

(4) Jewish religious philosophy.

(5) Homiletics: Instruction in the conduct of public divine services.

(6) Hebrew and Aramaic grammar.

(7) German language and literature, in case the students have not the requisite facilities to pursue this part of their studies elsewhere.

(8) Art of teaching (pedagogics), with especial reference to the congregational schools for religious instruction.

NOTE.—The study of the secular branches shall be regulated by the faculty in accordance with the local school systems and opportunities. * * *

The fifth year is intended for such students as shall have previously completed their course of study at one of the colleges or universities of the country, and thus shall be able to devote their whole time to the studies in the Rabbinical College. The hours of instruction shall be thirty a week.

In 1877 the Emanu-El Preparatory School of the Theological Seminary was organized in New York City. In 1879 there were three classes—6, 20, and 9 members, respectively; the sessions were Sunday mornings, 10 to 12; Wednesday afternoon, 4 to 6; Saturday afternoon, 3 to 5. Tuition free to all wishing to attend.

In 1885 a circular was issued to each Jewish minister whose address was attainable covering the inquiry—

What measures seem to you practicable to assure to the rising generation of Jews such Jewish teaching as will more surely tend to create in them an active interest in Jewish affairs and an earnest participation in the intellectual and moral life of the Jewish community.

The replies deserve study for their treatment of general principles as well as for the information they contain as to the special conditions and needs of Jews. Only exceedingly abbreviated citations can be given here. Dr. Solomon Eppinger, Cincinnati, laments—

That in this country not only most of the youth, but a great portion of the older Jews, do not care much about Judaism and Jewish affairs.

As causes "of this unhealthy condition" he notes the freedom which many Jewish immigrants assume to extend to religion, only desiring to make money and be buried in a Jewish burying place; the clinging to ceremonies by certain others without conception of the real object of religion; the disposition of some to avoid being known as Jews for social or commercial reasons.

The consequence of all this is that in the families of such so-called Jews every trace of Judaism is avoided and the children grow up without any education in religion; and even if such children should be sent to a Jewish Sabbath school, what support would the teaching of the school find in the family? And yet in regard to the teaching of religion, as in many other matters, the house is the principal place where the culture of the heart begins and must be mainly sustained.

Rev. I. Epstein, St. Louis, writes in a degree like Dr. Eppinger:

1. It is, I think, generally conceded that the religious training the child receives in early years at home is the basis of all subsequent improvement by teachers of the Sabbath school, self-instruction, and intercourse with the companions in later years. * * * The mothers in Israel must be awakened to a sense of responsibility in order that they may see the necessity of reestablishing a true Jewish home by their own pious example, observance of Sabbath and holy days, prayers, etc., but, above all, by instilling into the tender hearts of their dear children the principles of truth, virtue, and morality.

2. The teachers employed at our Sabbath schools must be in every respect, both intellectually and morally, competent to teach the Jewish religion. * * *

3. There must be more time given to the religious education of the Jewish youth. An hour on Sabbath morning and two hours on Sunday will not suffice to teach Hebrew, catechism, and biblical or post-biblical history.

Rev. Dr. J. S. Goldammer, Nashville, Tenn., responded:

The measure to assure such Jewish teachings is simply the Jewish teaching as laid down in that glorious old Book of Books, in the six verses of the sixth book of Deuteronomy, where it is said, "Thou shalt teach them thy children." * * *

Religious education is the only practicable measure to assure that teaching which you desire for the rising generation. This measure, I am sorry to say, is entirely out of use at the present. The parents of the present generation have dropped it, and I know of no other measure able to substitute it. * * *

We are living in a materialistic age, in which mammon is the supreme power, the business place the temple, and pleasure-seeking the worship. * * *

This condition of affairs, however, was not brought about by the rising generation, but by the raising generation. * * *

Let the old folks manifest actually their thoughts of God and their religious feeling by those forms adopted by modern reform, and the young folks will emulatively follow in their wake. Let the raising generation pray and worship God in the vernacular of the country, reverently; * * * let them keep holy the Sabbath day and go into the house of God, father and mother, and take their children by the hand as they do when they go into places of amusement; let them begin to train their children in Israel's pure religion. * * * Let the ministers preach not only rational and philosophical, but preeminently Scriptural sermons, and let the Sabbath schools be conducted so as to impress more their heart than their brain.

Rev. Henry Iliowizi, Minneapolis, Minn., convinced "that the plague of American Israel is ignorance, or, at best, half knowledge," favors, first, "a more thorough instruction in Jewish history;" second, "a rational interpretation of the miraculous events in our Scriptures," and "a good Jewish weekly or monthly for the young."

Nearly all the respondents lay emphasis on home training as fundamental, but Jacobs Jacobson, of Atlanta, Ga., says:

Wherever our youth are lax in their participation in religious affairs, I think the rabbis first and the parents next are to be blamed.

Rev. S. Mannheimer, Cincinnati, Ohio, mentions two things as—

essential to revive and reawaken the spirit that animated the generation of the past. A synod (or call it conference, convention) must establish a common platform for American Judaism. * * *

The second essential point is the celebration of the weekly Sabbath. * * * All our measures to arouse the spirit of the young generation are in vain if we show them by our example that lucre and gain have more power over us than the dictates of our religion. What beneficent results can we expect from the teachings of the school and the pupil if they are at variance with the practices of life.

The next quotation, from the same speaker, is to be interpreted as summing up a statement, including a condemnation of whimsical, capricious, and sensational aberrations in the pulpits, for which he blames such congregations as allow and encourage them:

Uniformity of divine service, in which, like in former times, old and young must take an active part, and a more general observance of the Sabbath. These are, according to my humble opinion, the two essential requisites for the maintenance of Judaism. Without these two mainstays, all other devices and measures will only be palliatives that may for a while mitigate the evil, but will not cure it.

Rev. Dr. Messing, Indianapolis, Ind., says:

The cause of the decline of religious sentiment among our rising youth is to be traced mainly to the want of religious practices in our homes. The utter neglect of our modern Jewish parents to heed that admonition of the wise King (Proverbs xxii, 6), * * * "Train up the lad in accordance with his course; even when he groweth old will he not depart from it," seems to me to be the root of this great evil. There may hardly be 10 per cent of Jewish family circles where a word of prayer is yet heard or a religious ceremony yet practiced. The synagogue and Sabbath school can only cooperate with home religious influence and example. As long as our home life remains void of these, I can see no remedy against and no hindrance for the further decline of religious sentiment among our rising youths.

Rev. Dr. M. Mielziner, Cincinnati, Ohio, says:

The principal agents for such training and education are:
(1) The parental home.
(2) The Sabbath school.
(3) The synagogue or temple.

Dr. Mielziner's reply occupies 4 octavo pages, but at the risk of inadequate expression of his suggestions, the extracts must be only those which most relate directly to Sunday-school work, or to the training of the youth. He says:

In the first place, I have to point to home training. * * * In doing away with obsolete forms and ceremonials of domestic life, many parents have, at the same time, banished from their homes every religious practice, every prayer and devotion. The children grow up without their hearts and minds ever being touched by religious thought and feeling, and without seeing and hearing anything that reminds them of their allegiance to God and Israel.

The few weekly hours which such children later spend in the Sabbath school can not make up for the neglect of their religious home training. * * *

Regarding our Sabbath schools, I beg leave to notice that many of them labor under the great disadvantage of having no teachers thoroughly prepared. * * *

Another defect connected with our Sabbath schools is the early age at which the children are considered absolved from the obligation of attending such schools. After having gone through the solemn and highly important act of confirmation at the average age of 13 to 14, they quit the Sabbath school, and with it all further religious instruction. The religious knowledge which they acquired is, even in the best case, elementary only. * * * The divine service is either entirely neglected by them, as their parents fail to show them a good example, or if they do attend they remain but passive lookers on, as our mode of worship fails to invite their participation in congregational song and devotion, and their intellect is not yet ripe enough to be interested in and benefited by the lectures from the pulpit.

Dr. Mielziner would organize normal classes to prepare teachers for higher branches of religious instruction, especially English Bible reading with explanations and post-biblical history. For those above 17 years of age he would extend the organization and educational work of young men's Hebrew associations and increase the publication of the treasures of Jewish literature in English in agreeable form.

Rev. Dr. Samuel Hirsch, Philadelphia, Pa., feels "deeply aggrieved at the wording of the circular which pertained to 'the rising generation of Jews,'" and says:

As long as it is proclaimed religion is for others, for the rising generation, I see no hope. The rising generation imagines itself as wise, if not wiser, than the grown-up people, and if grown-up people do not need spiritual food, should they need it?

Rev. Dr. Voorsanger, Houston, Tex., is like Dr. Hirsch in locating the trouble:

What, I ask you, should induce the children to be better than the parents? I tell you we are going too far in accusing our youth. We should accuse ourselves. * * *

To summarize: Our youth can be saved and recovered by—
(1) The example of the elders.

(2) The induction and application of a positive religion.

(3) The reorganization of worship upon a more distinctly Jewish basis.

(4) By making the Sabbath school the most important organization in the country, instead of the sündenbock [1] to be kicked by everybody.

Rev. D. H. Zirndorf speaks of the work of the home and the exemplary lives of adults. Of the principal drawbacks to the Sabbath school, he says:

(*a*) They are only Sabbath and Sunday schools, with other words, the insufficiency of the time; (*b*) their half-and-half character, hemming them in between day school and domestic dolce far niente, between a Christian Bible class and a laborious Jewish training class; (*c*) the comparative insufficiency of the text-books; (*d*) the inadequateness of the teaching staff, composed in smaller congregations especially, but as it happens in larger towns likewise, mostly from volunteers, not less well intended than they are ignorant and unsystematic. It speaks for itself that the standard of Jewish knowledge becomes daily more and more lowered; (*e*) the want of a discipline ably sustained and enforced; (*f*) the inadequate action or inactivity (as it may be) of administrative boards and the oratorical posing of the usual spokesmen of each respective congregation.

To remedy these evils is at present almost impossible. I offer the following suggestions for consideration: (*a*) It is chimerical to think of a uniform teaching method; (*b*) the publication of good text-books is to be encouraged by prizes; (*c*) poorer congregations should receive financial aid from the union; (*d*) school libraries should be established; (*e*) the scanty time should not be squandered away by too much singing exercise or recitation of poems; (*f*) professional and salaried teachers should, wherever feasible, be appointed.

In 1886 a Sabbath school convention in Cincinnati formed a Hebrew Sabbath School Union with a constitution covering the following article (VII):

SECTION 1. The executive committee shall prepare plans to carry into effect the unification of the work of the Hebrew Sabbath schools as specified in the following sections:

(*a*) Instruction in the principles, doctrines, and precepts of Judaism.

(*b*) Instruction in reading of the Bible in the vernacular.

(*c*) Instruction in the Hebrew language at least to the extent of understanding the Hebrew prayers and appropriate portions of the Bible.

(*d*) Instruction in Jewish history covering the biblical and post-biblical periods.

(*e*) Instruction in music, with a view to prepare children to participate in the service.

SEC. 2. In addition to the foregoing, which shall constitute a six years' course, including a one year's course for confirmation, the executive committee shall also provide for a two years' course of instruction for a post-confirmation class and a complete course of study for normal classes, so as to educate advanced pupils to become teachers, and likewise to enable persons remote from congregations to prepare themselves to organize and conduct religious classes with the aid of the lessons supplied by this course.

SEC. 3. The executive committee shall provide at intervals for the publication of pamphlets containing graded lessons to be taught in said schools, such lessons to include brief texts with explanatory notes. They shall also provide for the publication of the various books of the Bible, with commentaries, also for a juvenile Jewish literature of books, compiled from the rabbinical writings, or in which works of later Jewish authors are utilized.

---

[1] Scapegoat.—J. H. B.

SEC. 4. The executive committee shall furnish free to each Sabbath school copies of its publications, and each pupil in every Sabbath school shall receive free one copy of each pamphlet published by the union.

There is some overlapping in a list of subjects taught in the Hebrew Sabbath schools, but it seems unavoidable, as the Bible of one school may or may not be parallel with the Proverbs, the Psalms, or the Pentateuch of another, and the history of one may or may not include the biblical history of another.[1]

The American Bible Society publishes an edition of the Old Testament without chapter headings, which is in use by many Jews. They object to the headings in ordinary copies of King James's version as without due authority and sometimes erroneous. The King James translation is not fully satisfactory to them; hence the preparation of the Leeser Bible, already mentioned.

The best accessible notice of a current Hebrew Sunday school is that of Mr. A. Caswell Ellis,[2] who visited a Hebrew reformed school at the Temple Emanuel on Fifth avenue, New York. He does not give its size. He says:

This school meets every Sunday morning, but follows completely the principles and methods of the public schools. Children must get permission from the educational committee of the church in order to enter the school. They all meet together in a large hall for the opening exercises of devotion, and then the school

[1] The following statement of subjects taught, books used, with authors and translators, is condensed from the statistical report published by the Union of American Hebrew Congregations in 1889:

Subjects and books, Hebrew Sabbath schools, 1889.

Subject.	Books and authors or translators.
Bible	Mendes, A. D. Moses, Leeser.
Bible questions.	
Biblical ethics.	
Biblical history	Deutsch, Hecht, Katzenberg, Mendes.
Catechism	Jacobs, Katzenberg, I. Leeser, Loeb, Mendes, Moses, Nathan Pike, Szold.
Child's Bible	Mendes.
Chronological tables	Kohler.
Ethics	Moses.
Hebrew	Primer, Aufrecht, Sonn, Union; Reader, Union, Felstentahl, Mannheimer, Stein; Grammar, Mannheimer.
History	Adler, Deutsch, Hecht, Katzenberg, Katzenstein, Pinnock.
Hymns	Hecht.
Judaism	Wise.
Morals.	
Music.	
Pentateuch.	
Post-biblical history	E. Hecht, Magnus.
Proverbs	Moses.
Prayer book.	
Psalms	Mielziner.
Religion	Jacob's Hebrew Faith, Jacob's Path of Truth, Nathan's Road to Truth.
Scripture questions	Pike.
Singing.	
Also not clearly defined:	
Text-books of	De Solla.
Manual	Dr. Gottheil.
Guide	Epstein.
Publications of	A. J. Messing.
Cards of	Superintendents of schools.

[2] The Pedagogical Seminary, June, 1896, p. 393.

divides into five grades, each grade going into an entirely separate room. There are only these five regular classes in the school, each studying one of the five grades of Katzenberg's Biblical history. There is also opportunity to study post-biblical history, by Hecht.[1] In these large classes the teacher is seated at his desk on a platform at one end of the room, and conducts the recitation just as do the teachers in the graded schools. The pupils are marked, and are promoted from one section to another as they would be in public schools.

The following table of enrollment is prepared from the latest available official statement of Hebrew Sabbath schools:

Hebrew Sabbath schools, 1889.

ROMAN CATHOLIC SUNDAY SCHOOLS.

In its plans for the education of youth the Roman Catholic Church keeps its Sunday-school work under ecclesiastical supervision and direction. The celebration of the mass is in many instances the preparatory service for the Sunday school, and often includes the exposition of the Scriptural lesson of the day. The church has a number of brotherhoods and sisterhoods devoted to teaching, for which the members are carefully trained, and there are summer professional schools which even experienced teachers attend annually. In the best schools the organization has a high degree of regularity and definiteness. Some priest, chosen for his fitness, has the responsible supervision. Instructors are utilized as far as practicable from the teaching orders, and enough are assigned to give, in general, one teacher to every seven or eight pupils. The gradation in the schools

[1] Misprinted "Hischst" in the magazine quoted. Letter from Mr. Ellis.—J. H. B.

is more or less formal, according to circumstances, ranging from the youngest class in a catechism of elementary faith and duty to adults with text-books in Bible or church history. There is a great variety of catechisms, and there are several authors whose works are used in the study of Bible and church history, prepared or approved by bishops or higher authority in the dioceses interested.[1]

The following course of religious instruction for the children in a prominent church[2] is illustrative:

Text-books.—The Baltimore Council Catechisms, Nos. 1, 2; Deharbe's Catechisms, complete, No. 2; Gilmour's Bible History, Murphy's Bible and Church History, Noethen's Church History, The Bible.

Hours of instruction.—A daily recitation of lesson in school; instructions on the gospels at the 9 o'clock mass, Sunday morning; Sunday school for one hour immediately following 9 o'clock mass; special instruction, 9 to 10 a. m., Saturday morning, for children who do not attend Catholic schools.

For three months of the year instructions are given to first communicants.

The children in the church schools receive a "lecture" once a week in Christian doctrine.

The Catholic yearbooks do not give the statistics of Sunday schools, though they show nearly 800,000 pupils under daily religious instruction in 3,361 parishes at parochial schools. There is no estimate of the number in the Catholic Sunday schools that has more than a suggestive value. A general idea of their strength in any State may be based upon the return of communicants at the last census under the uncertain presumption that the number in Sunday school equals one-fourth the number of communicants. This number, as returned in the census of 1890, is given below as a guide to any one for a relative distribution of Sunday-school membership by States.

Roman Catholic communicants or members, 1890.

LATTER DAY SAINTS SUNDAY SCHOOLS.

The Church of Jesus Christ of Latter-Day Saints has its principal membership in the States of Utah and Idaho. The history of the church needs as much notice here as will enable any one to form an intelligent opinion regarding its Sunday schools.

The Latter-Day Saints accept the Scriptures of the Old and New Testaments, and, in general, the precepts of conduct and the ordinances therein prescribed. They baptize by immersion.

The distinction between Latter-Day Saints and most others who accept the Christian Scriptures begins with their claims of recent and continued revelations largely embodied in the Book of Mormon, from which has grown the common name of Mormons, distasteful to them. The book was put forth in 1830. There are later revelations claimed, including a "revelation on the eternity of the marriage covenant, including plurality of wives, given through Joseph the Seer in Nauvoo, Hancock County, Ill., July 12, 1843." The contest over polygamy between the Latter-Day Saints and the nation is to many the principal distinctive feature of their position, yet a branch of the church, embracing about one-eighth of the total strength, has steadily rejected polygamy.

The peculiar history of this church and its possible future in this country justify extended citations from its Sunday-school literature.

The statistics of the Sunday schools here presented are from those published by the Deseret Sunday School Union for the year ending December 31, 1895. That union published in tabular form (1) the number of schools in each stake, (2) the name of the stake, (3) Stake superintendents with post-office addresses, (4) number of times the school was held during the year, (5) number of male teachers and officers, (6) number of female teachers and officers, (7) total of (5) and (6), (8) average attendance of officers and teachers, (9) number of male pupils, (10) number of female pupils, (11) average number of pupils, (12) total number of officers, teachers, and pupils, (13) number of pupils in the primary department, (14) number of pupils in first

intermediate department, (15) number of pupils in second intermediate department, (16) number of pupils in higher department, (17) number of books in libraries, (18) cash on hand at last report, (19) miscellaneous cash collected, (20) total collection from nickel donation, (21) grand total collected, (22) cash disbursed, (23) cash in treasury.

There are nearly 40 per cent more male teachers and officers than female; about 3 per cent more female pupils than male.

The Deseret Sunday School Union represents a thorough organization, with publications to aid the various subdivisions of the work. There is a general superintendency of all of the schools. There is a stake superintendent for each stake of Zion. The term stake is applied somewhat like diocese in some other churches, including all who form a unit for ecclesiastical purposes.

In each stake of Zion the high priests constitute a quorum without respect to number; * * * a quorum of elders numbers 96, a quorum of priests 48, a quorum of teachers 24, and a quorum of deacons 12. Each of these quorums has its president and two counsellors.[1]

There were 35 stakes in the United States besides the missions—to the Eastern States, 2 schools, headquarters Brooklyn, N. Y.; to the Northern States, 6 schools, headquarters Kansas City, Mo.; to the Southern States, 27 schools, headquarters Chattanooga, Tenn.

The books used by the Latter-Day Saints for instruction range from the Bible down to books of personal experiences.

There are primers and other books for the younger children, "A guide for the officers and teachers of Sunday schools in the various stakes of Zion," lectures upon Sunday-school work, normal Sunday-school training classes in the academy at Provo, and an annual Sunday-school conference of two days' duration in each stake of Zion. The first Sunday of September is designated as "nickel day," on which it is the aim to have each Sunday school contribute a nickel for every pupil enrolled. Twenty per cent of the money thus raised is retained for local expenses and the remainder is turned over to the general fund.

In 1894 quite definite suggestions were printed on the "Manner of conducting and grading of Sunday schools," from which the following paragraphs are condensed:

Order of conducting school.—Officers and teachers should be present at 9.45 a. m., welcome students or visitors as they enter with a kind word, assign each pupil to the proper place.

Begin promptly at 10 a. m., call roll of officers and teachers, a song to be sung by entire school, appropriate prayer offered, then a second song, read minutes of previous Sabbath showing number of teachers and of pupils, by sex, and the subject taught in each class. Then should follow the administration of that sacred ordinance, the Sacrament of the Lord's Supper, during which the most profound

[1] Catechism for children, exhibiting the prominent doctrines of the Church of Jesus Christ of Latter-Day Saints. By Elder John Jaques, Salt Lake City, 1897.

silence should be maintained. If preferred, a few remarks may be made to the children as to the nature of the ordinance, and why they partake of it; appropriate hymns may be sung by the children or music rendered by the organist in a soft and reverential style.

Then students march to appropriate music of the organ to their places of study. The studies should be in accordance with wishes of the Union Board. About 11.30 * * * the school should reassemble, practice singing for ten minutes, and all partake of the spirit inspired by the closing exercises. When on the outside of the building the children should regard the ground as sacred, and not give way to boisterous and irreverent conduct, but should leave the grounds in an orderly manner.

Grading.—The process of assigning each pupil to the department best suited to his capacity and arranging the department so as to enable the pupils to progress by logical succession of studies is important and laborious, requiring excellent judgment and consideration on the part of officers and teachers. Age and yet more aptness and natural ability of the pupil are to be considered. While local conditions must modify the arrangements, speaking in a general way, each school should be graded into four departments where there are a sufficient number of pupils and proper facilities. * * * A separate room for each department is very desirable; but where there is but one room, it is found the best results follow the schools which have taken wires upon which are hung curtains and stretch them across the building, making three or four divisions—one for each grade; but it is well, where possible, to have the primary by itself. * * * Many schools are now operated with excellent results with but one room, divided as above suggested.

The primary grade should include the smaller children under, say, 8 years of age; first intermediate, from 8 to 12 years of age; second intermediate, from 12 to 16 years of age; and the higher department from 16 years of age and upward. These departments should not be subdivided into smaller classes, but kept as one and instructed as a whole by capable teachers (except where the classes are entirely too large). * * *

Teachers.—Over each of the four departments there should be a head teacher, with two or three good, faithful assistants, all laboring under the direct supervision of the superintendency, who, together with the teachers, should lay out a general plan for the whole school for six or nine months or a year.

One of the assistant teachers is expected to make the record of attendance without interruption of exercises conducted by some other person.

The suggestions as to the primary and first intermediate departments are in harmony with those general titles. The caution is given for the first intermediate that "little reading should be allowed in the class. Students should be encouraged to read and study their lessons at home."

The comments for the second intermediate touch an experience common to all Sunday-school work and familiar in the day schools.

Here the children are of such an age that they require careful attention. It is generally the children between these ages (12 to 16) that are hard to get into the Sabbath school. * * *

Over this critical period of mental growth the teachers should aim to lead the pupils by instructing them and inciting a love for truth and creating ennobling and high aspirations; by inducing them to read at home the lives of great and good men and women, and in the class room to recite or put in the form of an essay and read the results of their home reading; by appointing certain ones to

give brief lectures on interesting and useful subjects; by requesting certain others to look up certain questions; by gem thoughts and any other legitimate exercise, all connected with the lesson, should the teacher labor to create a love and desire for the right and for Sunday-school work. * * *

If the pupils of this age can be encouraged to love and attend Sabbath school until this critical period is passed, great good will have been accomplished, the Sabbath-school work will be enhanced, and the pupils placed on a solid foundation from which they will not be likely to fall.

The higher department is to include all over 16 years of age.

The teachers for this department should be men and women well matured in judgment and devoted to a conscientious performance of their work. The students here are supposed to have an understanding of the first principles of the gospel, and should be able to give consistent reasons for their position, quoting references, authority, etc.

Special lines of the principles of theology should now be taken up and followed to their legitimate ends before others are handled. * * * All lessons and references should be prepared at home. Reciting should be the exercise, rather than reading round and round, as in the past. Lectures on the subject of the course should be given by different students, and the teacher should do little talking. Questions and answers should be allowed and freedom in discussing the principles of the gospel should be encouraged. * * * Should teachers for other departments be needed, this is the place to select them.

We believe if these instructions are followed out by every Sabbath school that a better class of work will be done. The condition of the schools will be materially advanced, and the moral and religious growth of the children will become a portion of their very beings.

The following extracts[1] have a suggestive interest throughout the country:

Highest department.—Composed of teachers and also those who have passed a successful examination in the other departments.

Studies.—The course of study in the department should be full and comprehensive and should be classified and arranged methodically, each study following another in proper order and sequence, after the following suggestive plan:

First. The Messianic Dispensation of the Gospel, including the three years' ministry and work of the Saviour.

Second. The history of the church the first century after the death of our Saviour.

Third. The Apostacy and the Dark Ages which followed.

Fourth. The Reformation, with a brief but clear outline of the work done by Wycliffe, Luther, Melanchthon, Zwingli, Calvin, Knox, Cranmer, and others, and its effect upon the world.

Fifth. The Restoration of the Gospel in its fullness by an angel to the Prophet Joseph Smith; the prediction of Prophets concerning the latter-day work and the great work of restoration and redemption to be wrought therein. * * *

As infidelity is now growing and spreading to such an alarming extent throughout the Christian world, and as the ability of the majority of believers to give a reasonable answer, aside from Scriptural evidences, of the faith within them is so exceptional, it is specially desirable that one of the leading studies of the theological department should be a frequent and ample consideration of the evidences of

[1] Guide for officers and teachers of Sunday schools in the various stakes of Zion, Deseret Sunday School Union, Salt Lake City, 1893.

Deity, of Christianity, of the divinity of the Bible, Book of Mormon, etc., from such sources outside of the Scriptures as will arrest the attention of the indifferent and skeptical, and which will enable the students to satisfactorily answer the sophistries of the infidel and the cavil of the mocker. Nelson's Cause and Cure of Infidelity and Paley's Evidences of Christianity and Natural Theology are excellent works treating upon these subjects.

Text-books and books of reference.—Bible; Book of Mormon; Doctrine and Covenants; Outlines of Ecclesiastical History, by Elder E. H. Roberts; Voice of Warning; Key to Theology; Pearl of Great Price; Compendium; Orson Pratt's works; Mosheim's Ecclesiastical History; Eusebius's Ecclesiastical History; Dictionary of the Book of Mormon.

For lower grades of Sunday schools some of the same books are recommended in the same "guide," and the following in addition: Oxford Teachers' Bible; Books of Mormon Charts; Moral Stories; Gow's Primer of Politeness; Simple Bible Stories; Story of the Book of Mormon; Catechism Cards on Manners; the Word of Wisdom and the Ten Commandments; Sunday school leaflets; New Testament; Faith Promoting Series; Preceptor.

The report shows that approximately two-fifths of the pupils are in the primary department and one-fifth in each of the other departments. It is estimated that the total enrollment includes about one-third of the entire church population. The numbers given are as follows:

Sunday schools, Latter-Day Saints.

States.	Schools.	Officers and teachers.	Pupils.
Wyoming	9	136	763
Colorado	9	104	1,008
Arizona	35	537	3,128
Utah	413	7,301	63,906
California	3	14	85
Idaho	122	1,852	12,077
Indian Territory	5	14	75
Eastern States	2	7	46

The United States	631	10,137	81,903

UNITARIAN SUNDAY SCHOOLS.

In the (Congregational) Unitarian churches, in addition to classes organized after a customary plan for study of the Bible, certain special classes may be found, as, for example, the following for persons above 16 years of age in a church of Boston, Mass.: First, the "Citizenship class" of gentlemen and ladies who wish to study the methods and principles of our Government; second, "How our part of the world was made," involving the elements of the geology of the neighborhood.[1]

The report of the Unitarian Sunday School Society for 1896 gives

[1] Christian Register, October 23, 1896.

a list of 189 contributing churches and Sunday schools distributed by States as follows:

Maine, 7; New Hampshire, 11; Vermont, 1; Massachusetts, 128; Rhode Island, 3; Connecticut, 3; New York, 6; Pennsylvania, 3; Delaware, 1; Maryland, 1; Virginia, 1; South Carolina, 1; Ohio, 2; Kentucky, 1; Illinois, 2; Michigan, 2; Wisconsin, 2; Iowa, 1; Kansas, 1; Montana, 1; California, 3. This but partially represents the organizations of the denomination. The numbers enrolled are not given.

CONSOLIDATION OF ALL REPORTS OF ATTENDANCE OBTAINED FOR SUNDAY SCHOOLS.

The complete statistics of Sunday schools do not appear ever to have been satisfactorily gathered. The attempts to gather them in the census produced no results accessible to the public, although a great amount of labor was expended, especially in the Tenth Census. The lack of accurate records in many cases and the vast amount of volunteer service of a casual sort is a hindrance to the precision of returns.

The Protestant ecclesiastical bodies generally include Sunday school returns in their yearbooks; but, as there will be occasion to observe, their methods of tabulation vary so that a summary for the country is not readily made from the separate reports.[1]

The following statement represents in a general way the total number of scholars derived from all reports accessible:

Scholars reported in Sunday schools, 1895.

In schools reported by the International Sunday School Convention	10,893,523
In Hebrew Sunday schools	13,506
In Latter-Day Saints Sunday schools	81,903
In Roman Catholic Sunday schools (estimated)	1,500,000

This indicates something like 12,500,000 scholars in Sunday schools of all qualities and degrees of excellence.

SUNDAY SCHOOL LIBRARIES.

The publishing houses of the great denominations have catalogues of books intended for Sunday school libraries, especially within their own constituency. As an aid to those who have limited means for purchase and care and limited experience in selection, it is common for publishers of books intended for Sunday schools to prepare sets that may be purchased complete in uniform sizes and bindings, often included in boxes to serve as bookcases in the schools. These vary from $5 upward in cash and from 25 volumes upward in books. The library sometimes assumes a great importance in connection with the

[1] See note at end of report on Sunday schools.

Sunday school, becoming a circulating library of sufficient consequence to be kept accessible on one or more days between Sundays. Some schools maintain reference libraries containing the standard church histories, Bible dictionaries, and commentaries. Where a school has funds at command, a suitable place for housing the library, and a membership of readers, the library may grow to require the fullest professional care in selection and administration.

The condition of Sunday school libraries has provoked considerable comment within recent months. Without entering upon the adverse and defensive statements put forth, the following paragraph is quoted for a view of the situation as it appears to officers of the oldest society in this country, prominent in the supply of such libraries:[1]

> The diversity of opinion respecting books suitable to be placed in Sunday school libraries has become more marked during the past year. This diversity tends toward two extremes—one admitting all sorts of literary works popularly designated as "standard and current literature," the other admitting only that which is intended to explain and enforce Biblical passages, and which is studied in the Sunday school classes. Hence there is a marked increase in the tendency of Sunday schools to fill their libraries with the common, cheap works of history, science, philosophy, and fiction, which make no pretense of containing the truths of the gospel, and not unfrequently make covert attacks upon religion, or have an undertone of antagonism to the gospel as old fashioned and quite out of date. This disposition to "bait the worldly" by secularizing the Sunday school library has caused some schools to throw out the library altogether, lest its influence should become satanic rather than saving. In both these ways the circulation of works of a decidedly religious type through the Sunday school has been diminished.

In some schools there is a regular system of maintenance, occasionally by endowment, and books that have possessed local usefulness are placed where some one may yet find value in them. The plan of the New York Yearly Meeting of Friends (Hicksite) for furnishing "traveling libraries" of selected books to be exchanged among country schools, already mentioned under Friends, has a suggestion of well-guarded selection, large privilege, and wide usefulness at a moderate cost. Lack of means, want of facilities for care, and other contingencies limit the possibilities of libraries in greater or less degree. Some schools make large use of children's papers to supplement libraries in the circulation of reading matter, and in some cases the papers alone are used. While varying considerably in excellence, these papers often have pictorial illustrations that are prized by children, especially by those who have scanty literary help from other sources. Few denominations have records showing the number of Sunday-school libraries or the number of books therein. The Hicksite Friends report 107 libraries, with 30,937 volumes; the Presbyterian Church in the United States of America, 939,587 volumes; the Latter Day Saints, 50,067 volumes in Sunday-school libraries.

[1] The Seventy-second Annual Report of the American Sunday School Union, 1896, pp. 9, 10.

The following is a partial list of children's or youth's papers, marked w, for weekly; m, monthly; f, fortnightly; sm, semimonthly:

Baptist.—Our Little Ones, w; Young Reaper, m; Sunlight, f; Our Young People, w; Our Boys and Girls, w; Barnens Tidning (Swedish), w; Child's Gem, w; Der Jugend Herald, m; Kind Words, w, f, m.

Christian.—Sunday School Evangelist, w; Our Young Folks, w; Little Ones, w; Pure Words, w.

Congregational.—Wellspring, w; Mayflower, w; Little Pilgrim, w.

Evangelical Association.—Sunday School Messenger, w, sm, m; Der Christliche Kinderfreund, w, sm, m; Das Evangelische Magazin, m; My Lesson, w; Laemmerwerde, w; Der Evangelische Kinderfreund, m.

Evangelical Lutheran.—Sunday School Herald, m; Little Ones, w; Kinderfreund, m; Busy Bee, m; Child's Paper, m.

Friends.—Our Youth's Friend, m; Olive Leaf, m; Try, Try Again, m.

German Evangelical Protestant Church of North America.—Der Christliche Jugendfreund, w, sm.

German Evangelical Synods of North America.—Christliche Kinder-Zeitung, m; Deutsch-Amerikanischer Jugendfreund, m; Unsere Kleinen, sm.

Latter-Day Saints.—Christian World, sm.

Methodist Episcopal.—Sunday School Journal, m; Sunday School Advocate, w; Sunday School Bell (German), m; Sunday School Banneret (Swedish), m; Classmate, f; Little Missionary, m.

Methodist Episcopal, South.—Our Little People, w; Sunday School Visitor, w, sm, m.

Methodist Protestant.—Our Morning Guide, w; Our Children, w.

New Church.—Sower, w (October–June).

Presbyterian.—Forward, sm; Morning Star, sm; Sunday School Visitor, sm; Sunbeam, w.

Protestant Episcopal.—American Church Sunday School Magazine, m; Shepherd's Arms, w, m; Young Christian Soldier, w, m.

Roman Catholic.—Annals of the Holy Childhood, bi m; same, German; Chimes, w; Little Crusader, w; Katholische Jugendfreund, m (German and English); Angelus, w; Pritel Ditek (Bohemian), w; Przyjaciel Dzieci (Polish), w.

Unitarian.—Every Other Sunday.

United Brethren in Christ.—Children's Friend, sm; Missionary Visitor, sm; Der Jugend-Pilger, sm; Lessons for the Little Ones, w.

United Evangelical Church.—Evangelical Little Folks, w; Sunday School Evangelical, m, sm; Missionary Evangelical, m; Bright Jewels, m; Jugend Freund, sm.

Universalist.—The Myrtle, w.

Undenominational.—(W. A. Wilde & Co.) Our Sunday Afternoon, w; Children's Hour, w. (American Sunday School Union.) Young People's Paper, w; Picture World for Little People, w; Little People's Lesson Pictures, w.

SUMMARY.

The conditions of Hebrew Sunday schools have a special interest as among those whose ancient faith is a substructure upon which the belief of all who accept the Christian Scriptures rests. The Roman Catholic schools have a direct interest as traceable to the opening of the Christian era. A like interest attaches to the plans for religious education by Comenius, the great teacher of the Moravian Brethren, who claim to be a part of the original church. The schools of the Lutherans have an interest as representing in some degree the spirit

of those who left the Roman Catholic Church as reformers and who have become the Protestant denominations of our day. The Friends, in certain yearly meetings, show noteworthy attention to home training. The work of the International Sunday School Convention represents a large part of the effort of great denominations. The schools of the Latter Day Saints form part of the history of a remarkable religious movement wholly within the memory of living men as illustrating methods of propagating belief. Widely different as these groups and others in our country are in many respects, all have some community of belief and of purpose. Even if one or another is deemed to hold to error, any success it seems to gain is suggestive to the person who would teach a different faith, in so far as it leads to a careful examination of the relative value of the means employed in education.

The Sabbath school as a place of religious instruction dates from the original observance of the Sabbath by families.

Fundamentally, religious instruction is a parental or family duty. In association of families into communities this duty has been more or less assumed by the unit of organization, the church or the state.

While the periodicals of the day give greatest prominence to the international selection of lessons and the international organization is the chief agency for gathering statistics of Sunday schools, it must be recognized that some prominent educators do not indorse it, and even in the recent International Sunday School Convention criticism was made regarding the methods of selections and use.

Without entering upon discussion of the comparative merits of different lesson schemes, it is for historical accuracy to mention that there are whole denominations that do not use the international lesson; individual schools in other denominations and individual classes in numerous schools pursue courses laid out for their own special circumstances; other systems claim a large body of adherents for their advantages over the international series. The international committee has under consideration such modification of its plans that absolute uniformity of the Scripture lessons for all classes with gradation of limited methods of presentation will cease to be a peculiarity. A system that has gained large following has, as a prominent feature, gradation in the fundamental matter, the Scripture selections, as well as in the mode of presentation. Moreover, in the early years of international lessons little attention was paid to the church year whose special appointments have prominent consideration in certain great denominations. Latterly there has been a growing recognition of Christmas, Easter, and other church anniversaries in the international lessons to make them more widely acceptable.

The Hebrew school described by Mr. Ellis as cited, the plans of the Latter Day Saints, as cited under the subtitle Teachers, have a single responsible teacher for a department of the school, with such assistants as may be needed for seconding directions, attending to records,

and other incidental details. The same plan is occasionally successfully followed, especially with juvenile classes, in other schools.

The Lutheran congregations generally have catechetical classes in addition to the Sunday-school instruction for some months previous to Easter, preparatory to confirmation. The Protestant Episcopal churches have a similar custom. Many churches of Presbyterian connection have systematic instruction in the catechism in connection with the Sunday school or in addition to it. Other denominations make more or less use of catechisms. The Roman Catholic Church has special courses preparatory to confirmation.

Schools in austere climates, as on the Dakota prairies, must close often by reason of the severity of weather, and many are suspended for some weeks of the winter. In some of our great cities in warmer latitudes are schools that close even as long as three months for summer vacation by reason of heat and the absence of members from their city homes. These suspensions must break the continuity of series of lessons worked out for each Sunday of the year. Many make still further interruptions to systematic instruction for several special occasions of the year.

The case of the Sunday school as a pioneer or mission enterprise varies somewhat from that of a Sunday school as one of the services of a well-established congregation. It serves as a nucleus for the best effort for improvement to a degree unknown in churches or in neighborhoods equipped with all the facilities of prosperous modern societies.

[NOTE ON THE TABLES OF SUNDAY SCHOOLS.—One who has followed the report on Sunday schools carefully will have observed unsatisfactory elements in the figures given. No matter what subject is under investigation, if the facts required pertain to a period prior to the time of investigation, accurate records are essential to give an accurate showing. No visitor of a school can tell its attendance of a previous week or month or year except through records, and if they are wanting or imperfect no satisfactory summing up can be made. It would be well if there were a general agreement upon the facts to be recorded, which is hardly to be immediately expected, and yet it seems possible for great denominations, if not for national organizations, to agree within themselves what facts to make matters of fixed record.

Within the same denomination one subdivision will report "membership," which may include officers, teachers, and pupils, as "total enrollment" in certain other cases appears to do, or it may include only pupils, as is customary in public school records. Some Sunday schools report pupils and do not report teachers.

After all allowance for accidents befalling work ready for the press there seems to be in some quarters opportunity for more careful oversight of tabular work in manuscript and in proof. In one case the columns of a summary for scholars and for teachers were interchanged through a page, which attracted attention by the improbable showing, and was correctible by the detailed tables on which the summary was based. In another case, where the showing was improbable and there were no details given for verification, a letter to the editor of the tables secured a correction and statement that the error had not been previously noticed and it could not be determined how it occurred. Errors of ordinary addition are very common. This office has made the best use possible of the material available.

With improvements in records there can be improvement in tables based on those records, so that there is hope for betterment.

There have been eight international Sunday school conventions at intervals of three years. In the twenty-one years of the organization it is still uncertain what facts are covered by the international tables. The following extract is from a letter dated January 12, 1897, from M. D. Byers, international secretary, in reply to a letter of inquiry:

"There is some variation in the reports from the different States giving the statistics of Sunday schools. I believe that the First-day schools or Sabbath schools of the Friends and also the Universalist schools are included."

It is presumed that the secretary's belief is correct, and the schools of the Friends and the Universalists have been placed as included in the international tables, for which, however, the secretary stated in his letter of transmittal, the committee has no details.

In the effort to ascertain the limitations of the international tables the following statement was received:

"I have had some trouble in former years to exclude nonevangelical Sunday schools from the statistics, but I think that the St. Louis report may safely be regarded as strictly evangelical." Letter of E. Payson Porter, late secretary International Sunday School Association. The convention at St. Louis was held in 1893; hence the reference to the St. Louis report.

The imperfection of local record is evident to anyone who has attempted to investigate the subject.—J. H. B.]

CHAPTER X.

THE CURRICULUM OF THE LAND-GRANT COLLEGES.[1]

1. Report of the Committee on Entrance Requirements, Courses of Study, and Degrees, made to the Association of American Agricultural Colleges and Experiment Stations, November 10, 1896, by President Charles S. Murkland.
2. Report of the Section of College Work, by President J. E. Stubbs, chairman, November 10-12, 1896.
3. What Should be Taught in our Colleges of Agriculture? by President H. C. White.
4. Industrial Education, by President Charles S. Murkland.
5. Conservatism in Scientific Agriculture, by Prof. W. H. Jordan.

I.

REPORT OF COMMITTEE ON ENTRANCE REQUIREMENTS, COURSES OF STUDY, AND DEGREES, MADE TO THE ASSOCIATION OF AMERICAN AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS, NOVEMBER 10, 1896.

Your committee, appointed November, 1894, and continued with further instructions at the last annual meeting of this association, presents the following report:

ARTICLE I.

SECTION 1. Congress, in establishing and endowing the institutions known as the land-grant colleges, evidently intended that their work for the classes they were designed to benefit should be, as far as practicable, uniform in scope and character in the different States and Territories. It is inevitable, however, that this uniformity, desirable as it is, should be somewhat limited or conditioned by the environment of each college.

SEC. 2. The act of 1890, further endowing these colleges, points to their development along certain specified lines. In conformity with the spirit of this act, these institutions are constantly tending to become schools or institutes of technology. That they must be collegiate in scope is required by the law itself.

SEC. 3. The steadily increasing tendency to ignore and obliterate all State lines in scientific and educational work; the free intercourse in social and industrial life among the people of the several States, and, in consequence, the steadily broadening field of usefulness and activity open to the graduates of educational institutions; the association of the land-grant colleges into a national organization for the protection and promotion of their common interests; the increasing recognition by the National Government of the importance and promise of the work of these colleges—all these considerations make it desirable that the degree or degrees awarded by these colleges should represent work approximately uniform in character and scope; should be, in other words, degrees of such recognized value as to pass current, each the equivalent of the others, in any State or Territory.

SEC. 4. It is clearly recognized that the social and educational conditions prevailing in the several States make it impossible, for the present, to prescribe

[1] Compiled and edited by Mr. Wellford Addis, specialist for obtaining and collating information regarding colleges of agriculture and the mechanic arts.

uniform requirements for admission into the colleges of this class. In some States, for some time to come, concession must be made to the defective condition of the public school system. But it by no means follows that in making such concessions the colleges are prohibited from protecting their standards of work and graduation. These, by proper effort, may be maintained and made to conform in educational value to those of the colleges which are more happily situated. Moreover, a certain community of interest makes it the duty of each college to protect at the same time its own reputation for thorough educational work and the reputation of its sister institutions.

SEC. 5. The educational conditions prevailing in the United States make it impossible to require of students in schools of applied science or technology that their liberal training should be acquired in preparatory schools. These institutions, therefore, can not exclusively confine their attention to technical subjects. They must include in their courses for graduation certain elements of a liberal (or general) education.

SEC. 6. These considerations, thus briefly outlined, make it desirable that all colleges in membership with this association should unite in requiring for the bachelor's degree or degrees at least the following general studies:

Mathematics, at least through algebra, geometry, and trigonometry.

Physics and chemistry, with laboratory work in each.

English language and literature, at least two years' work.

Other languages (one, at least, modern), four years.

Mental science, and logic or moral science, one year.

Constitutional law.

Social, political, or economic science, one year.

SEC. 7. It is desirable, also, that the bachelor's degree or degrees should represent an approximate uniformity in the amount of work done in the several colleges. The conditions generally affecting these colleges are such that a greater amount of work is demanded of their students than is required in the colleges of longer standing and other traditions. In the judgment of your committee it is not too much to require the equivalent of fifteen hours per week of recitations and lectures, together with ten hours per week of laboratory work or practicums, including the time devoted to military science and drill. Upon this basis, the above-mentioned general studies should be assigned a relative importance approximately as follows:

	Hours.
Algebra	75
Geometry	40
Trigonometry	40
Physics	a 150
Chemistry	a 150
English	200
Modern languages	340
Psychology	60
Ethics or logic	40
Political economy	60
General history	80
Constitutional law	50
Total excluding laboratory work	1,135
Total	1,285

The total number of hours included in a four-years course, allowing 15 hours per week for 36 weeks, would be 2,160; with 10 hours laboratory work or practicums added, 3,600. In general terms, therefore, the foregoing general studies should comprise about two-fifths of the work required for a bachelor's degree.

SEC. 8. It is recommended that in the establishment and nomenclature of degrees the colleges should strictly observe the doctrine of parsimony, and that only the baccalaureate degree of bachelor of science be conferred for a technical course of four years.

Statement in the diploma that the degree is conferred for the accomplishment of the course in agriculture, engineering, chemistry, etc., would afford differentiation enough to distinguish the several varieties of the degree.

---

a Including 75 hours laboratory work.

ARTICLE II.

ENTRANCE REQUIREMENTS.

SECTION 1. The difference in the character of the school systems, both public and private, of the several States is too great, in the opinion of the committee, to permit the formulation of rigid entrance requirements applicable to all the colleges having membership in this association.

SEC. 2. But the committee holds that it is advisable, as a beginning, to determine the requirements in a few subjects upon which it is possible for all the colleges to agree, and to recommend others, which, although too high at present for adoption by some of these institutions, may yet serve as a standard or goal toward which effort may be directed.

SEC. 3. As a standard series of entrance requirements, to be adopted as soon as possible, we recommend the following:

1. Physical geography.
2. United States history.
3. Arithmetic, including the metric system.
4. Algebra, to quadratics.
5. English grammar and composition, together with the English requirements of the New England Association.
6. Plane geometry.
7. One foreign langauge.
8. One of the natural sciences.
9. Ancient, general, or English history.

SEC. 4. From a careful examination of the catalogues we believe it to be practicable, either now or in the near future, for these institutions to unite in requiring as a minimum for admission to their lowest collegiate class:

1. Physical geography.
2. United States history.
3. Arithmetic, including the metric system.
4. Algebra, to quadratics.
5. English grammar and composition, together with the English requirements of the New England Association.

ARTICLE III.

We recommend that the conclusions embodied in this report be adopted as indicating essentially the position of this association; with the express declaration, however, that the association in adopting this report does not attempt to exercise any function other than an advisory one, and that any attempt to enforce an arbitrary uniformity would result in unmixed evil. These conclusions may be summed up as follows:

1. That two series of entrance requirements, a standard series and a minimum series, be approved by the association, and that the two series herein given be so approved.

2. That approximately 15 hours be devoted to recitations or lectures each week for 36 weeks each year; that 10 hours laboratory work or practicums be added.

3. That the list of studies given in section 7 of this report be included in every course leading to a bachelor's degree.

4. That the degree of bachelor of science be recognized as the standard degree conferred by the colleges of this association.

Respectfully submitted.

CHAS. S. MURKLAND.
ABRAM W. HARRIS.
GEO. W. ATHERTON.
J. M. MCBRYDE.
THOS. F. HUNT.

II.

REPORT OF THE SECTION ON COLLEGE WORK TO THE TENTH ANNUAL CONVENTION OF THE ASSOCIATION OF AMERICAN AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS.

By J. E. STUBBS, *Chairman.*

Mr. CHAIRMAN AND GENTLEMEN OF THE CONVENTION: Owing to the quite recent resignation of the chairman of the "Section on college work," I have been called, as vice-chairman, to perform his duties. Whatever of completeness and thoroughness may be lacking to this paper is due to the very limited time allotted to its preparation.

I invite your attention at first to a somewhat common incident. Imagine yourselves for the moment in the "library car" of the Union Pacific Express, east bound, on the evening of the 4th of November. For the most part, the occupants of the car are Western men of affairs, keen and practical. Conversation and discussion over the exciting news of election day have begun to grow weary, when suddenly new interest is aroused by the introduction of a fresh topic, namely, the kind of an education which should be given to farmers' sons. Two bright-minded men, one from Montana and the other from Colorado, affirm that there is too much of higher-education nonsense in the country; that one of the modern heresies is that of giving the so-called higher education to farmers and farmers' sons, who would do better for themselves and their country if they were content with a common-school education along with the practical discipline and training of the farm. This opinion is hailed by a chorus of approval, with the further observation that there is too much of football and of similar sports in the college education of to-day. The first protest against the views just set forth came from a young lawyer, I guess, of Wyoming, who charmed us by a prophetic vision of the possible Websters and Clays and Jacksons that might be lost to our country if the farmer boy should fail to realize his ambitious dreams of public life because of the repressive influences which restrict his education to the district school and his scientific training to the field and the stable.

This incident is worth noting for the reason that it expresses the views and convictions of very many men who are thoroughly practical, able, and successful in their own respective callings.

Being an interested listener to the discussion, I tried to formulate in my mind three propositions which, by way of answer, I should be willing to maintain:

First. That the higher education, so called, has become absolutely essential to the prosperity and welfare of those who choose agriculture as a business or a life calling. This holds true also with respect to industrial callings, such as engineering in its various branches and the higher class of commercial activities. If it be true that "the test of national welfare is the intelligence and prosperity of the farmer," then the colleges of agriculture and mechanic arts established by the Federal Government have been wisely established, and will cement more firmly the foundation of the national prosperity and honor. Our practical mining friends of the discussion have simply failed, like many others, to give the due weight to the remarkable changes which have taken place in the industrial training and education of youth. The technical schools and the schools of applied science in colleges and universities have taken the place of the shop and the foundry of our fathers' time, and partly, too, of the farm, in the industrial education of this country and of other countries as well. These institutions for higher education, these colleges of agriculture and mechanic arts, now stand at the end of the Appian Way, to eager feet the noblest gateway to the Eternal City of industrial and commercial prosperity, as well as to political peace and supremacy.

On the other hand, the lawyer from Wyoming has failed to grasp the truth that there are other lines of education than the accepted type of classical education

which, while giving wide range of choice to special taste and aptitude, is both broad and liberalizing, and gives development and culture to the man, while training him in the particular disciplines which fit him for the successful pursuit of industrial and commercial callings.

If, according to Dr. W. T. Harris, United States Commissioner of Education, "urban life is the life of the future and of the highest civilization," one or the other of two effects must follow in the future life and growth of this country. Either our soil will be tilled by tenants for the benefit of the landowner who resides in town or city, giving thereby encouragement to the growth of two distinct classes—the one a poor, dependent peasantry, the other an intelligent but selfish and unpatriotic class of absentee landlords—or we must cherish and develop in our schools and colleges that kind of training and culture which shall build up an intelligent, prosperous, and independent class of farmers and artisans, each of whom owns his own home, tills his own fields, markets his own products, helps to regulate the affairs of his own township, sits in the councils of his own State or of the nation, in character, in intellectual, and in social qualities the peer of lawyer, capitalist, or priest.

Second. That the interest in athletic field sports, such as football, baseball, and tennis, in our colleges, though but incidental to the life and work of these institutions, has nevertheless an ethical, and thereby educational, value which is worthy of high regard.

The college president who keeps in view the highest character development of his students knows full well that the athletic exercises which have become, and which will remain, a striking feature of college life do, when properly guided and guarded, displace to a considerable degree the pernicious practices that spring into action when any body of young people are brought together in common association, and do further promote the cultivation and attainment of the better qualities of personal character—such, for example, as courage, obedience, endurance, and regard for personal honor. The gymnasium of Germany and the public school of England offer a strong contrast in this matter of school and college field sports, but the free and vigorous activity of Eton's football or cricket field is superior from every point of view to the rigid and systematic ordering of the daily exercise of the German gymnasium boy and to the dueling practice and drinking habits of the university student. The truth is that the outdoor life and the field sports, which have grown so rapidly into favor with American colleges, not only with the colleges for young men but also with those for young women, may be so guided as to promote a higher average of scholarship, good habits, perfect health, yea, a graceful type of womanhood as well as a sturdy type of manhood.

Third. That in the correlation of the subjects of instruction and discipline according to accepted pedagogic principles in the courses of study offered by the colleges of agriculture and mechanic arts, it will be found that the particular subjects in mathematics and in pure and applied science are carefully harmonized with those general subjects in language and literature, in the social sciences, and in history and philosophy, which pertain to the college courses usually denominated liberal.

As bearing upon this point, I quote the views of Prof. E. W. Hilgard, of the University of California, as given to me very recently in a personal letter. He speaks of the course in agriculture given by the University of California as follows: "With the average preparation we can command in this State, we find it necessary to devote the first two years of four substantially to the preparatory sciences and general culture studies, while the last two are given to the technical studies chiefly, though not exclusively. Among these elections should always be allowed, enabling the student to put special weight upon those branches that will be of chief importance to him in after life. We do not as yet in this country aim to educate all-around agricultural experts. There is too little demand for them;

and when the demand arises, the degree and kind of preparation is likely to have been changed by the introduction of agricultural science into the preparatory school. Then only will it be possible to establish a uniform course for the degree of bachelor of agriculture that will hold good all around. It makes a wide difference, too, whether the student comes from the farm or from the city. The latter clearly requires a different course, especially as regards practical studies, from the boy who has grown up on the farm and merely needs to give the explanation, as it were, of the practices he is already familiar with. An all-round agricultural expert can not, with our usual preparation, be turned out in four years. Agricultural science is the most complex of all, embracing as it does all the sciences from mathematics through physics, chemistry, both inorganic and organic, mineralogy and geology, botany, zoology, both theoretical and technical, vegetable and animal physiology, plus a certain amount of engineering. Unless a man specializes, the field is two wide to be covered in four years with any degree of thoroughness. For the present, then, we must leave the way open to specialization after a certain amount of general training, the time for which varies constantly with the conditions of the public and the preparatory schools."

Again, touching further upon the preparation and character of technical work in the course of agriculture leading to the degree of bachelor of science, Prof. Thomas F. Hunt, dean of the College of Agriculture of the Ohio State University, writes to me as follows:

"In a general way, I would say that the four-years' course in agriculture leading to the degree of bachelor of science should consist of one-third technical work of applied science, one-third science, and one-third language, history, and philosophical studies. It is of course difficult to classify studies precisely into the three groups mentioned, but in a general way I think we all understand it. On this basis our course at the Ohio State University, requiring 206 hours for graduation, contains the following technical work:

	Hours.
Agriculture	36
Agricultural chemistry	20
Horticulture	8
Veterinary medicine	15
Economic entomology	5

a total of 84 hours. Of the 206 hours, it is to be noticed further that 30 hours are elective, and that these may or may not be technical. But, disregarding the number of elective hours, we require 84 hours which may be fairly termed technical. This gives rather more than one-third technical work, and perhaps this is a little heavy."

It is to be observed that the 206 hours at the Ohio State University represents a fraction more than 17 hours a week for 12 terms. The proportion of technical work in the course outlined by Professor Hunt, even if we credit the 30 hours of election to technical subjects, and thus establish a course which represents the maximum number of hours to technical discipline, allows ample room for such cultural and social studies as will stamp the course with the character of giving a liberal education to its students.

It may be observed further that the acquaintance with the general truths of science which these technical subjects give will be of great service in the rational interpretation of all social phenomena, and we may therefore credit the technical studies with a definite value in respect to the kind of knowledge "which is of most worth.'

ENTRANCE REQUIREMENTS.

One of the most important subjects at present engaging the attention of the association is that which pertains to the requirements in branches of study that shall be established for admission to the freshman class of the colleges of agricul-

ture and mechanic arts, the extent and variety of the courses of study to be offered, and the academic degrees which shall be bestowed.

The deep and widespread interest in this subject is in evidence by the appointment, two years since, of a committee from this association, by the report of the committee of ten on secondary school studies and the report of the committee of fifteen on elementary education, both to the National Education Association, and also the report on the subject of entrance requirements by the Society for the Promotion of Engineering Education. Further, the appointment of a standing committee of five members from this association whose duty it shall be to report annually upon the best methods used in the various colleges and universities in the United States and in Europe for the instruction of students in the practical and scientific facts relating to agriculture, with the view to bringing instruction in agriculture into pedagogic form, gives additional emphasis to the importance of the matter of entrance requirements, and also the earnest purpose of the promoters of scientific and industrial education to put their subjects and methods into scientific form and relations.

I submit herewith the results of a brief study of the facts as they bear upon the present standard of requirement for admission to the freshman class of the colleges and universities that have membership in this association. The questions which I submitted to the colleges, bearing upon the questions of entrance requirements, were intended to be specific and easily answered. I have received no replies to my letters from Utah and North Carolina.

Out of forty-six colleges reporting, thirty have preparatory departments; sixteen have no subfreshman classes. In these preparatory schools, ten colleges have a one-year course; eight have a two-years' course; six have a three-years' course; one has a four-years' course; five are indefinite, merely reporting a subfreshman class.

SPECIFIC SUBJECTS.

English.—Eighteen colleges have the standard high-school requirements in English language and literature for admission to the freshman year. Twenty-eight colleges require that which represents the work accomplished in the eighth or ninth grade of the public schools.

Arithmetic.—Thirty-eight colleges require this subject to be completed. Eight colleges require the subject as far as interest and proportion.

Algebra.—Thirty-four colleges require algebra to or through quadratic equations. Four require the academic algebra to be finished. Eight do not ask for algebra.

Geometry.—Five colleges ask all of plane and solid geometry. Eleven colleges require all of plane geometry. Four colleges require from two to four books of plane geometry. Twenty-six colleges do not place geometry upon the list of subjects for admission to the freshman year.

United States history.—All the colleges make history of the United States an entrance requirement. Thirteen colleges require also general history.

Physics.—Fifteen colleges require elementary physics with laboratory practice.

Chemistry.—Nine colleges require elementary chemistry with laboratory work.

Physiology.—Seventeen colleges require elementary physiology.

Botany.—Eight colleges require elementary botany with field practice.

French or German.—Eight colleges require a reading knowledge of French or German.

Latin.—Twenty colleges offer from one to three years of Latin in their preparatory schools, and several offer Greek.

The institutions which have no preparatory departments are chiefly the universities in the wealthy and populous States where there are first-class high schools in all the cities and towns. In the newer and less populous States a well-equipped preparatory school of high-school grade, with courses of studies covering a period

of three or four years, is a necessity and will continue to be a necessity for very many years to come. The preparatory department is the means of supply to the college of many students who otherwise would never think of taking a college course.

It is evident, too, that the agricultural colleges divide themselves into two classes.

The one class receives the student into its freshman class from the eighth or ninth grade of the public school. The course in agriculture then becomes in the main a technical high-school course of study, with special reference to the farm and the farmer.

The other class of agricultural colleges requires the completion of a high-school course of study as a requisite for admission to its freshman class, and then seeks to maintain strong four-year courses in agriculture and in the applied-science courses, such as civil, electrical, mechanical, and mining engineering. In those States where the State university maintains strong schools of applied science and where the agricultural college is an entirely separate institution from the State university, it is evident that the college of agriculture and mechanic arts has found its field of work to be limited to giving a thoroughly practical training adapted to young men and young women who have finished such courses as are laid down in our best ungraded schools and best grammar schools.

The weight of opinion in this association seems to be that the colleges endowed by the Federal Government under the acts of 1862 and 1890 should be colleges according to the accepted standard in the best educational circles. I quote a paragraph from President Alvord's address, given at Denver last year, viz: "Institutions in affiliation with this association should in all respects be colleges in fact as well as in name."

NUMBER OF COURSES OFFERED.

In reply to the question, "How many four-year courses do you maintain?" I note the following: Ohio State University offers 15 courses; University of Washington, 14; Pennsylvania State College, 12; Maine State College, 9; California, Purdue, Kentucky State, Minnesota, Cornell, Virginia, and Wyoming, 7; Delaware, Idaho, Tennessee, and Wisconsin, 6; five colleges give 5 courses; eight colleges give 4; three colleges give 3, and fourteen colleges give 1 and 2 courses with numerous electives.

This general outline of the number of courses shows that the colleges of this association, even the weakest of them, are able to give a breadth and variety to their college work which is enjoyed only by the students of the oldest and best-known universities of this land.

The distinguishing feature of most all these courses of study is that they belong to the department of applied science. This is what differentiates them most strikingly from the average college of liberal arts. This it is that characterizes these colleges as the great schools for the industrial life of this country. This gives to us the great opportunity for training young men and women of high character and lofty ideals to become examples as well as leaders in the world's commercial and industrial activities.

All the colleges give courses in agriculture. Twenty-five have courses in civil engineering, twenty-two in mechanical engineering, twelve in electrical engineering, and five in mining engineering. Many of the mining States have a school of mines entirely separate from any other institution or in connection with the State university.

FEW STUDENTS IN AGRICULTURE.

But why so few students in the advanced agricultural courses? I think the answer is found in the conditions of agriculture at the present time; other depart-

ments of labor are more remunerative than that of farming. In many of the States there is not a ready market for agricultural products. In some States, at least, if not in all, the farmers themselves are not awake to the value of training in the agricultural college. In August last 85 boys, farmers' boys, entered the University of California, but not one entered the course in agriculture.

The 6 students who did enter the course of agriculture were from the cities. Yet it is wholesome to the thought and life of all our industries that agriculture be elevated to a worthy place in our system of college education. The comparatively few students who may complete these courses are worth to the country all their training costs, and when the time comes for the adjustment of the present unequal distribution of rewards of labor, the college-trained scientific farmer will be in patriotic demand.

All the colleges save eight are making special efforts to attract students to courses in agriculture. Addresses before farmers' institutes, lectures upon scientific topics, newspapers, bulletins, and contributions to newspapers are the principal means of bringing the work of the college to the notice and the esteem of the public.

MILITARY INSTRUCTION.

The department of military instruction in the colleges of this association is a subject I can not leave unnoticed. The military authorities have given particular attention to this subject from their point of view within the past two years. The Adjutant-General of the Army in his report for 1896 to the Secretary of War says: "The average number of students at the several institutions during the scholastic year was 3,401 less than during the preceding one, due perhaps to prevailing monetary depression. The number of those capable of military duty was, however, 3,009 more, and the number required to be enrolled as military students has increased 2,761. The aptitude and interest of these students under military instruction is generally satisfactory." The Adjutant-General further says: "The law authorizing details should be amended. I recommend that hereafter no detail be made to any institution that can not guarantee an enrollment of at least 150 military students, and that military professors at institutions having a less number in their military department be withdrawn and returned to their regiments."

If the recommendation of the Adjutant-General should become a law, the agricultural colleges of the following States would lose the detail of the military professor according to the report of last year under the head "Required enrolled as military students," viz: Colorado, Delaware, Florida, Georgia, Idaho, Louisiana, Maryland, Massachusetts, Nevada, New Hampshire, New Jersey, North Dakota, South Dakota, Oregon, Rhode Island, Tennessee, Utah, West Virginia, Washington, Wyoming; twenty colleges in all. Now, I venture to affirm that to strike these twenty States from the benefit of the military instruction provided for under the Morrill act would lose to the service much of the very best work that is done outside of West Point and the purely military schools. Take an illustration: I find that one of the leading Ohio colleges reports 997 students as capable of military duty. Of these 119 received military instruction and 77 were uniformed. It is evident from the above figures that the military spirit and military training does not abound in that institution. Furthermore, every college man knows that in the larger institutions of the East and middle West it is difficult to develop and maintain good military spirit and discipline. Now, compare this example with the Nevada State University that last year had at one time nearly 142 in the cadet battalion, that had an average attendance of 114 cadets, every one in uniform; every one required to perform his military duties regularly and strictly under the instruction of the commandant; theoretical instruction in the art and science of war given as a college requirement once a week to the cadets of the junior and senior classes of the university; one hour to drill every college day in

the week, save one, throughout the year, and the military department in favor with students and faculty. Now, what is true of the Nevada State University is true, I believe, with nearly all the colleges established under the Morrill act. The number of cadets in the Military Academy at West Point last year was 331. The recommendation of the Adjutant-General would put the minimum number of students in one of the colleges of this association to get the detail of an army officer at 150, but 15 less than the half of the total number at the United States Military Academy last year.

Again, in a recent article by Maj. Joseph E. Sanger, it is intimated that there is a decline in interest on the part of the officers of the colleges in the military department, that the instruction is not always up to the standard, and that in some faculties there is to be found positive opposition to the military department. I must say that I do not think these criticisms apply justly to many of the colleges. They ought not to apply to any. The provision for military instructions in the Morrill Act is a good provision, and should be welcomed by the administration of every college that enjoys the benefit of that act. "Whatever is worth doing at all is worth doing well" applies right here. It will be very easy, moreover, to remove any occasion for the above criticism.

To avoid any possible misunderstanding that the college faculty is not favorable to the department of military work, it should be understood that the military department is responsible, through its commandant, directly to the president of the college or university, and through him to the board of regents and trustees.

Again, the instruction in military science and tactics should be placed on the same footing with other subjects of instruction, and satisfactory work be required from every student who is a candidate for a degree.

A word may be said in respect to the kind of officer that should be detailed to college work. Not every officer is fitted by nature and training to become a successful college instructor. No officer who seeks an easy berth should be detailed to the college, but one who likes to work with young men, who is possessed of scholarly tastes and habits, who has a lofty ideal of the true soldier's character and life, and who, in cooperation with the president and faculty, infuses a worthy military spirit into the young men, and will aid in the development of a type of strong, self-reliant, loyal manhood which this country will ever need.

The union of military training with the development of the civic spirit in the education of our young men will dower this nation with a reserve corps of citizen soldiers unsurpassed in excellence by any age or in any land.

III.

WHAT SHOULD BE TAUGHT IN OUR COLLEGES OF AGRICULTURE?[1]

By Dr. H. C. WHITE, *President Georgia State College, University of Georgia.*

I am asked to discuss, in a short paper, the subject "What should be taught in our colleges of agriculture?" The use of the possessive pronoun in the title somewhat limits, or at least gives definiteness to the range of the discussion. The question, I take it, is not "What should be taught in a college of agriculture," but rather, "What should be taught in the colleges whose representatives are brought together in this association." The distinction is important in its bearing upon the discussion in hand. In order to determine what should be taught therein, it is proper to inquire what a "college of agriculture" is or should be. Assuming "agriculture" to be a distinct profession or pursuit in which men are to engage who are specifically and technically trained to that end, I can very well understand that there might be a college or school of agriculture as there are col-

[1] Read before the Association of American Agricultural Colleges and Experiment Stations, Washington, D. C., November 10, 1896.

leges or schools of medicine, law, theology, engineering, music, art, and other so-called "professions." In such event the college of agriculture, in determining what and how it should teach, could probably do no better than to follow closely the example set by these other professional schools in the character and scope of teaching which they offer and upon which they have determined after long years of experience and historic development. I think it may be truly said that the primary function of these schools is the teaching of the great body of rules of practice or procedure in the several professions, with incidental exposition of the scientific or dogmatic principles upon which the rules are based. It is acquiescence in these rules, indeed, which is "professed;" the recognition of their reasonableness and soundness which gives character to and uniformity in the tenets of the profession. Now, in order that such teaching may not be the mere inculcation of blind empiricism, these institutions take for granted (at least, the best of them do and all of them should) that their matriculates have already been educated; have had their stores of general information, their powers of observation and their faculties of reasoning already developed by the educative processes of the school, the academy, and the college.

Law, medicine, theology, etc., are "learned professions" not so much because the pursuit of them necessarily develops learning, but because, properly, only those should engage in them who are already learned in the sense that they are truly educated and so equipped that they are properly prepared to acquire increasing learning with increasing years. The schools which teach these professions are in fact (or should be) technical training schools in special lines. They are not truly, except incidentally, educational institutions at all. So, perhaps, should be a true "college of agriculture."

Now, I do not say that the practice of "agriculture" may not eventually be (or, indeed, is not now, for that matter) competent of exposition in a code of general rules of procedure such as those which are accepted as at the basis of the practice of law, medicine, or theology. But I think we must all admit, at least, that as yet these rules have not been framed to what our distinguished friend, Dr. Harris, so aptly characterizes as a "pedagogic form." As yet they have not been so systematized as to come within the province of the teacher. So long as this is true, in the sense which I have endeavored to convey, a genuine "college of agriculture" is, perhaps, without existence or the possibility thereof.

Undoubtedly it is extremely desirable that this great industrial art, the practice of which in these latter days has become, indeed, worthy to rank as a learned profession by reason of the manifold applications possible therein of the great stores of learning achieved in many of the branches of human investigation and research—particularly in the physical sciences—should speedily have its rules of procedure reduced to such form as will bring them within the legitimate domain of the "pedagogue"—he who "leads the children" to think and act aright in all the works of their heads and hands. We who form this association are, perhaps, of all men those most interested to that end. One object of this immediate discussion, no doubt, is to elicit an exchange of views upon that subject. Waiving this point for the moment, however, and turning to consideration of "our" colleges—what is it that should be taught in them?

As most clearly setting forth the objects and character of these institutions, I will be pardoned for quoting the familiar text of the laws establishing them. Each of them is a "college"—not an academy or a school; its function "to promote the liberal and practical education of the industrial classes;" its "leading object * * * to teach such branches of learning as are related to agriculture and the mechanic arts, * * * without excluding other scientific and classical studies, and including military tactics;" and each is under obligations to devote a portion of its revenues to giving "instruction in agriculture, the mechanic arts,

the English language, and the various branches of mathematical, physical, natural, and economic science, with special reference to their applications in the industries of life." I quote the law in this discussion concerning what we should teach in our colleges, because where its requirements are specific we are bound as honest men to observe them. Were they all specific and explicit, there would be no need of this discussion. What we desire to arrive at is an interpretation of the general requirements of the law and a course of procedure which shall best fulfill its spirit and intent.

Dealing first, then, with the specific injunctions. Our institutions are to be educational establishments, not professional schools. They are to contribute to the drawing out and direction of the intellectual powers of the youth of the land—particularly of the "industrial classes"—so that they may be properly fitted by "liberal and practical" education to engage in "the several pursuits and professions in life." They are "colleges"—and this designation helps us to determination of the stage in the educational process where our work should properly and profitably begin. With the differing conditions surrounding the institutions in different localities, it is obvious that no fixed and uniform regulations can be laid down upon this point. The subject of entrance requirements to colleges generally—in what topics and to what degree—is engaging the earnest attention of foremost educators in associations similar to our own, and, for our colleges, of an able and learned committee of this body. Excellent ideals are set to which it is sincerely hoped we may all ultimately be enabled to attain, uniformly, in all parts of our common country. As yet, however, this is manifestly not practicable. Time may make it possible. So far as "our" institutions are concerned, I think we might properly and safely demand of applicants for admission thereto that they should exhibit the same or equivalent measure of intellectual development and acquirement (in "liberal" culture, at least) as is required by other collegiate institutions in the same or similar localities. Our teaching should begin at a corresponding stage.

While upon this point permit me to indulge in a few reflections of a general nature, which are yet pertinent to this discussion.

1. Obviously there is no warrant in law or reason for the distinctive designation of our colleges as "agricultural" or "mechanical." I think it a pity that the habit has grown among us. "Land-grant," or "State," or "science" would be more fitting appellations if distinctiveness is desired. "Agricultural experiment station" is an eminently proper name for our stations. It indicates just what they are. "Agricultural" or "mechanical" prefixed to our colleges is unwarranted, to say the least, and is apt to be misleading.

2. I think it unfortunate that the word "classes" occurs in the Federal act of endowment. There should be no "classes" known to the law in this Republic. Surely we should recognize none in the construction of our schemes of education.

3. If, as we believe (otherwise our professions are a deceit and our occupation a fraud), the proper, acceptable, and successful prosecution of the great industrial pursuits—agriculture, the mechanic arts, and other—demand an education and a degree of culture, both "liberal and practical," no whit less thorough and no lower in order than is required for engagement in other pursuits, we should take care that nothing which we set forth in the curricula of our colleges shall be a confession of the weakness of our faith or capable of construction into an admission that our education develops less worthy men, less able thinkers, less competent leaders of their fellows, or leads to less honorable or dignified pursuits than that which is furnished by other collegiate institutions.

We should never forget that our colleges are one important fruit of the memorable conflict, actively begun a half century ago and waged and won within our generation, between science and dogma, for the recognition of the study of the

physical sciences as a legitimate and necessary factor in genuine education. They were born of this conflict, the victory in which was a triumph of modern enlightenment over ancient narrowness, a decision that new elements should be introduced into our educative processes, not to supplant but to reenforce the old, that the two together might contribute to the formation of a completer man. The successors of the victors would woefully misapply the fruits of the victory if the institutions which they set up should deliberately embrace the very errors which were combated to give them life, and exhibit a narrowness and one-sidedness in their curricula which, although of opposite tendency, would be no less fatal to the development of the perfect man than those which in the older institutions were condemned. The laws creating our colleges not only permit us to guard against this danger; they enjoin us so to do. The provisions of the law are in accordance with the wise and reasonable views on the subject of education which guided the conflict referred to to its successful termination. Efficient hewers of wood and drawers of water and skilful artisans there were in abundance before the blessed enactment of 1862. This was not designed to add to their numbers or to perpetuate their guilds. It was intended to increase the learning of the youth of the land, to furnish them with intellectual powers and stores of knowledge especially applicable in the industrial pursuits, by providing liberally for education to that end, in order that those who might engage in such pursuits should no longer be mere slaves of a craft, but freemen in the intelligent prosecution of their chosen handiwork.

The specific subjects enjoined by the law to be taught are:

1. *Military tactics.*—As a lover of peace and of all agencies in the body politic which conduce thereto, I should be inclined, individually, to say—except for the physical training involved and because of the association—more's the pity; but, as we have it to do, let us do it thoroughly and well—not necessarily to the extent of placing our students under military discipline, which, personally, I deprecate for many cogent reasons, but as efficiently, consonant with its peculiar character, as we propose to instruct in other branches embraced in the curriculum.

2. *Agriculture and the mechanic arts.*—Let me waive discussion of these for the moment.

The nonspecific injunctions of the law are certainly general enough to weigh upon the conscience of no man who is a wise educator. They should be so, for, obviously, differing conditions in revenues, locality, character of students, and other will make necessary differences in the curricula of the colleges—both in the number of branches taught and in the relative importance assigned them. "Branches of learning related to agriculture and the mechanic arts," "without excluding other scientific and classical studies;" "the various branches of mathematical, physical, natural, and economic science, with special reference to their applications in the industries of life." Surely, so far as the letter of the law is concerned, the strictest constructionist could not assert that anything having the faintest shadow of a claim to be considered a branch of education might not be taught in our colleges. The great purpose of our colleges may be gatherd from both the letter and the spirit of the law. It is to furnish a "liberal and practical education," suitable for those who may be expected to engage in industrial pursuits. Without entering into discussion (which would be interminable) of what is or may be meant by the "liberal" and the "practical" in education, I think we all recognize that there are certain great groups of studies which differ somewhat in their educative purposes and methods, although their ultimate aim is the same, and it is not always easy to determine, for a given study, to which group it more particularly belongs; the one devoted mainly to redecraft, the other to handcraft; the one dealing mainly with the mind, the other with the sense; the one characterized sometimes as "literary," the other as "scientific." Both are necessary in judicious education.

Our colleges are called upon to furnish both, but this does not mean that they are to exhaust the field in either direction or to be uniform in the branches which they adopt, or in the relative importance they may assign them. I venture to say that, personally, I should consider certain branches as universally essential, each to be pursued to the extent commonly covered by a college course. These are: In redecraft, the English language and literature, mathematics, psychology; in handcraft, drawing and the physical sciences—physics, chemistry, and biology—with regular and ample laboratory work in each. To these fundamentals it is possible, and may be desirable, to make many additions on either hand. In redeculture, the classical and foreign languages, history, economics, moral science. In handculture, subdivisions of the physical sciences to any extent which may be practicable or desirable, mineralogy, geology, workshop mechanics, and the elements of technology in various lines. The pedagogic value of these differ with differing circumstances, and each college should carefully determine for itself those best suited to its special conditions. One thing, however, I think should constantly be borne in mind in the conduct of this, the truly educational work of the colleges. In teaching the "branches of learning related to agriculture and the mechanic arts" we should make it clearly appear that they are so related. In the liberal culture given by study of the masterpieces of our English tongue, for example, selections might readily and preferably be made to show that correct speaking and writing, a pleasing style in composition and expression, adherence to the rules of rhetoric, and even, perhaps, a touch of the breath of poetic inspiration are as becoming and necessary in one who speaks and writes of the industrial occupations of the people as of him who declaims of their rights and liberties upon the stump or discusses their political problems in the columns of the press. The evolution of civilization presented by the study of history may be as well, if not better shown by emphasizing the part played therein by peaceful industries as by recountal of battles and sieges and the lineages of kings. Patriotism may be inculcated no less through proper pride excited by the industrial achievements of our country in its times of peace than by panegyric of its glories won in times of war.

Illustrations necessary to demonstrate natural laws in science may be taken from the myriad examples furnished upon the farm, in the field, and in the workshop, which will serve at least equally as well the purposes of pure science as those arranged artificially in the laboratories or on the lecture table. Where differentiation is found possible, moreover, in the physical sciences, those branches should be selected which relate most directly to industrial pursuits, provided, always, that a proper pedagogic method is afforded and a genuine scientific spirit be maintained. Soil physics, agricultural chemistry, botany, entomology, and animal nutrition may serve for truly educative purposes as furnishing illustrations of principles in the study of the pure sciences, physics, chemistry, and biology. In fine, while it is not necessary nor is it proper that we should erect our colleges into unreasoning partisans of the industrial arts, as in antagonism with other pursuits, yet we should make manifest to our students by illustrations drawn therefrom in our educative processes, by the teachings of history, and by exhibition of their proper and legitimate fruits that through them lies a path to usefulness and happiness at least equal in stability and dignity to those offered by other occupations and professions.

So much for the educational work of our colleges. What shall we say to the injunction to teach "agriculture and the mechanic arts?" How far may we go, and in what manner, to make our colleges, in part, training schools in distinct pursuits? This, I take it, is the point of most interest in the present discussion. First, then, as to agriculture: While my opinions are merely tentative, and I can not be said to have yet reached positive convictions on the subject, but with a fair acquaintance of what is doing at home and abroad in this particular, I am inclined

to think that the school of agriculture should be a school of demonstration, not of attempted education.

The professor of agriculture (if there be one) should teach neither physics, nor chemistry, nor biology, nor engineering, nor any parts thereof, under the titles of soil physics, agricultural chemistry, stock breeding, farm surveying, and the like. He should rather demonstrate the applications of the previously taught principles of pure science in the operations of the farm. The school of agriculture should be provided with a suitable farm, including orchards, garden, and dairy, each equipped in the best manner possible, with proper buildings, stock, cattle, and machinery, and each should be conducted regularly and systematically as a model of its kind in illustration of the proper and best methods of actual practice in the several branches of agricultural industry. The students of the college should be admitted to witness, and, if need be, to take part in the operations, and the demonstrator in each should be competent and required to give explanation of the processes and the reasoning underlying them. It can readily be seen that the number of these processes may be very great, including preparation and tillage of land, drainage, irrigation, feeding and care of stock, breeding of cattle, vegetable and fruit culture, butter and cheese making, the housing, preparation, and marketing of farm products, and a great number of others. The point I particularly make is that these operations should be illustrative, and, in every case, performed in the very best manner that science and experience direct. The school of agriculture should be the clinic of the college; in a manner it should bear the same relation to the college that the hospital bears to the college of medicine. It should be designed primarily for those who have already received, or are at the same time receiving, the educative culture of the college proper, and it should not undertake to duplicate or infringe upon the pedagogic work of the college. This may seem unnecessary to say, but perhaps it is not so so long as it not infrequently happens that a "professor of agriculture" conceives it his duty to give lecture-room instruction to his classes in smatterings of botany, agricultural chemistry, vegetable and animal physiology, and other such topics which properly belong to the departments of the several special physical sciences, where they can be taught much better and with a proper regard to the period in the student's education where they should be introduced, and since most of our text-books on so-called "agriculture" follow the same general plan in their treatment of the subject.

Although certain of these topics may in strictness be considered of the nature of applied rather than of pure science, they are in the main such as should enter into the education of any man of liberal culture, and should not be estimated as the peculiar possession of those only who purpose entering the industrial pursuits. So far as the text-books are concerned, perhaps it is not possible to follow any other plan, since the practice of agriculture can only be taught by actual demonstration. When what they do is well done--as is the case in the admirable little manual of our friend Professor Voorhees--these books serve a most useful purpose, but should not be taken as exemplifying the course to be given by the professors of agriculture in our colleges.

Again, this illustrative work and training of the college farm and its attachments should be distinct from the research work, in its several lines, of the experiment station. It is unquestionably eminently advantageous and desirable that the station should be intimately associated with the college; particularly for the sake of the station, but for the sake of the college as well. For that matter an investigator in one might very well be (and preferably) a teacher in the other, and advanced or graduate students of the college might be admitted to participation in the researches of the station, but the work in each should be distinct, and, while they should cooperate and aid each other whenever possible, the distinctive purposes and functions of each should be carefully discriminated. In connection

Our colleges are called upon to furnish both, but this does not mean that they are to exhaust the field in either direction or to be uniform in the branches which they adopt, or in the relative importance they may assign them. It can readily be seen that the number of these processes may be very great, including preparation and tillage of land, drainage, irrigation, feeding and care of stock, breeding of cattle, vegetable and fruit culture, butter and cheese making, the housing, preparation, and marketing of farm products, and a great number of others. The point I particularly make is that these operations should be illustrative, and, in every case, performed in the very best manner that science and experience direct. The school of agriculture should be the clinic of the college; in a manner it should bear the same relation to the college that the hospital bears to the college of medicine. It should be designed primarily for those who have already received, or are at the same time receiving, the educative culture of the college proper, and it should not undertake to duplicate or infringe upon the pedagogic work of the college. This may seem unnecessary to say, but perhaps it is not so so long as it not infrequently happens that a "professor of agriculture" conceives it his duty to give lecture-room instruction to his classes in smatterings of botany, agricultural chemistry, vegetable and animal physiology, and other such topics which properly belong to the departments of the several special physical sciences, where they can be taught much better and with a proper regard to the period in the student's education where they should be introduced, and since most of our text-books on so-called "agriculture" follow the same general plan in their treatment of the subject.

Although certain of these topics may in strictness be considered of the nature of applied rather than of pure science, they are in the main such as should enter into the education of any man of liberal culture, and should not be estimated as the peculiar possession of those only who purpose entering the industrial pursuits. So far as the text-books are concerned, perhaps it is not possible to follow any other plan, since the practice of agriculture can only be taught by actual demonstration. When what they do is well done—as is the case in the admirable little manual of our friend Professor Voorhees—these books serve a most useful purpose, but should not be taken as exemplifying the course to be given by the professors of agriculture in our colleges.

Again, this illustrative work and training of the college farm and its attachments should be distinct from the research work, in its several lines, of the experiment station. It is unquestionably eminently advantageous and desirable that the station should be intimately associated with the college; particularly for the sake of the station, but for the sake of the college as well. For that matter an investigator in one might very well be (and preferably) a teacher in the other, and advanced or graduate students of the college might be admitted to participation in the researches of the station, but the work in each should be distinct, and, while they should cooperate and aid each other whenever possible, the distinctive purposes and functions of each should be carefully discriminated. In connection

with technical training in handcraft, instruction might properly be given in the school of agriculture in farm management and economics, in the history of agriculture in all its branches, and in the systematic and critical study of agricultural literature.

So much for agriculture. Instruction in the mechanic arts—into which subject I may not enter—I take it should follow the same general lines, the workshops taking the place of the farm.

Now, I am aware that I have mapped out an amount of work for our colleges which is stupendous; either the educative work or the illustrative work is alone very great; the entirety—to us of small means, especially—is simply appalling. It will rarely, perhaps never, happen that any one of our colleges can do it all. But I submit that it would be wise to follow the general policy which is herein outlined. Let each college do what it can and make its selection among the lines of work offered according to its means and the conditions surrounding it. Upon certain points I should be inclined to insist in all cases.

1. That our colleges should be colleges in fact as well as in name. They should be educational institutions in higher learning, in which the physical sciences particularly should fill their proper and important place as educative branches. They should be true colleges, requiring, on the one hand, of those admitted to them a certain proper degree of previous education, and on the other stopping short of the specialization in distinct branches which constitutes in pure sciences the proper work of the university, and, in certain of the applied sciences, of the experiment station.

2. That they should provide the necessary and proper amount of this educational work first of all, and should never permit themselves to become the nurseries of unlettered craftsmen in the industrial arts, however skillful. This need not necessarily exclude from certain of the technical courses those who are seeking information rather than education, but care should be taken that the chief function of the college is educational, not informational.

Where the land-grant college subsists exclusively upon its Federal revenues, it must, perforce, be modest in its aspirations. Should other collegiate institutions exist in the community with which it may cooperate, so that it may require of those admitted to it a previous reasonable degree of college education, then its work may legitimately be given over chiefly to the demonstrative teaching which I have indicated. Best of all, perhaps, is the arrangement, when it is feasible, of such intimate and local association with other collegiate institutions as will provide for the educative and leave the bulk of the revenues of the college available for the technical, demonstrative work. Such an arrangement as—my friend Professor Bailey will permit me to say—is so admirably administered at Cornell University in the State of New York, for example, certainly leaves nothing to be desired. I am quite well aware that "many men, many minds," and that an arrangement of a given character which might be admirable in one locality and under one set of conditions might not work well in another locality and under different circumstances. I am discussing the question purely from an ideal standpoint. In any event, whatever may be the conditions, redecraft (in its best and thorough signification) should precede, or at least accompany, handcraft, however thorough this may be. In no other way in my judgment can our colleges serve the great purpose for which they were founded—to make of the industrial pursuits intellectual occupations to be engaged in by educated men. Our colleges must give such good, genuine, broad education to their students as will equip them with mentality requisite to cope successfully with their fellows in the intellectual struggles of life or else they fail of their purpose, become a laughing stock of scholars and a hurt rather than a blessing to the community.

IV.

INDUSTRIAL EDUCATION.[1]

By Dr. C. S. MURKLAND,

President New Hampshire College of Agriculture and the Mechanic Arts.

MR. CHAIRMAN, MEMBERS OF THE MASSACHUSETTS BOARD OF AGRICULTURE, AND FRIENDS: It is with great pleasure that I avail myself of your permission to speak here to-day. It occurred to me while your chairman was speaking that undoubtedly one of the reasons why the New Hampshire College was moved nearer to your border was because of the strong attractive tendency of the State of Massachusetts, naturally drawing us by its educational energy; and I am very sure that all we in New Hampshire who are interested in education are delighted to get nearer Massachusetts, either locally or in spirit, in purpose and in method.

The necessity of condensing what I might wish to say in the time allotted me has compelled me to leave some important matters utterly unmentioned, and to briefly touch upon others, simply commenting upon a few points; for the subject of industrial education is not one which can be disposed of in a few words—it is a subject which touches vitally the interests of our people. Without further introduction, let me say:

It is the misfortune of educational movements that they have always to deal not only with the resistance of ultraconservatism, but also with the impatience of impetuous radicalism. On the one hand is the drag of objection, on the score that that which has been good enough before is good enough now; and on the other hand is the strain of insistance upon perfection, as if educational methods and results might spring forth fully developed, as Minerva was said to spring fully equipped from the head of Jove. One class of people clamors against anything largely new in educational methods and purposes, while another class clamors, with equal vehemence, for such development of the newer methods and such definition of the newer purposes as have been gained for the older education only by the experience of centuries. To clearly understand this double strain is to get at the heart of the difficulties in the way of industrial education, and to get at the heart of the difficulty is at the same time to gain an understanding of the position of industrial education, in this country as in other lands.

Industrial education, which may be defined as education having in view immediate application in some of the pursuits and professions of life, is at present involved in some necessary confusion in this country because of the difficulties it has met on either hand. It was inevitable that so great an innovation as that embodied in the changes from the traditional and time-honored methods of education should, for its definite development, require much more time than has yet elapsed since the first institution for industrial training was established. An expression used by Dr. William T. Harris, the United States Commissioner of Education, in a recent address, will be found useful in making this fact clear. In that address[2] he spoke of a "pedagogical form" as a necessity in teaching any subject. And by the phrase "pedagogical form" is meant a series of lessons so arranged that they shall be actually progressive. In mathematics, to use the illustration Dr. Harris himself used, there is a definite progression in which each lesson plainly follows the lesson before it and demands that the preceding lesson shall have been mastered. In mathematics and the classics the "pedagogical form" has been developed by long trial and is essentially fixed. There may be

[1] Read at the public winter meeting of the Massachusetts State Board of Agriculture, December 4, 1894.

[2] Before the American Association of Agricultural Colleges and Experiment Stations, Washington, D. C., November 14, 1894.

changes in text-books; it may be questioned whether or not Cæsar shall follow the lessons in easy Latin, the fables, and short historical extracts; but the teaching form is not thereby affected. One who has to teach mathematics has no difficulty in deciding which place in the course shall be held by analytical geometry, for instance. He has only to decide what text-book will best suit his classes by being best adapted to the requirements of the pedagogical form under the circumstances in which he finds those classes. The same is true of him who has to teach the classics, or even the modern languages.

In the matter of language the form is less definitely determined than in the case of mathematics, but it is still fairly well defined. It certainly is to be questioned whether or not there has been any improvement upon the system which simply took the "pedagogical form" used in teaching the classics and applied it to teaching the modern languages. The main fact, however, is clear; in the older education, represented by the teaching in the classical colleges, there has been the advantage derived from established forms, by which both the process and the result of the teaching have been essentially fixed.

Industrial education, on the other hand, has lacked this advantage; and, lacking this, it has lacked that which can be gained only through the experience of many years, and by the tentative trials of many institutions during these years. Industrial education in this country, as in Europe, is too young to have arrived at the maturity which will represent what such education is when at its best. And this which is true of industrial education in general is true of its different divisions. So that it is a thing to be expected that those departments of industrial education which lend themselves most readily to a teaching form should be most perfectly developed and therefore in the most satisfactory condition.

Mr. Carroll D. Wright, Commissioner of Labor, presented a report February 7, 1893, in which he adopted a classification separating industrial education into three divisions, respectively represented by the schools for manual training, the technical schools, and the institutes of technology. The "half-developed colleges of agriculture and the mechanics," as he calls them, he places between the technical or trade schools and the technological institutes of university grade, giving them, rightly enough, perhaps, an indefinite and rather nondescript position. Adopting, for convenience, his classification, it is to be noticed, first, that industrial education has been concerned with the mechanic arts and the manufacturing industries almost exclusively, until a very recent date. From the establishing of the Rensselaer Institute, at Troy, N. Y., in 1842, till to-day, engineering, in some of its divisions, has been the predominant department in the industrial institutions in the United States. Allied with mathematics as engineering always is, demanding a thorough preparation in mathematic instruction as it does, this department of industrial education has easily adopted the pedagogical form ready to its hand in the established form of mathematical teaching. In affording new details of application, engineering has not had to grapple with the difficulty of supplying or developing the form itself; it has found the form already prepared for its use.

This is something which should never be forgotten by those who are moved to speak or write upon this subject. It is easy enough, for instance, to complain that in the industrial or technical institutions of the country agriculture is overshadowed by mechanics. It ought to be easy to see that while this may be the case, while it is naturally, even necessarily, the case, it is so simply as a temporary phase of the general problem of industrial education. It is not that one department is held in higher regard than another. It is simply that one department found a teaching form ready to its use, while another faced, and faces still, the necessity of developing its own form. No one has advanced a form for teaching agriculture, for instance, so definite, so well arranged in progressive sequence, that it could be generally adopted as, on the whole, a satisfactory method for universal use. It may be safely prophesied that no one will suggest such a form for

some years to come. And the institutions in which agriculture is taught are thrown thereby into a confusion which is for the present practically inextricable. What requirements shall be demanded of the students who enter such institutions? How shall the studies apportioned to the successive years be determined? How long shall the prescribed course be? What degree shall be conferred upon completion of the course? These are questions which find answers as many as there are institutions involved. And this confusion can not be reduced to order until it is possible to apply to every department in such institutions some well-defined form of teaching, such that the progress in one department shall be as definite and as real as the allied progress in every other department.

I have singled out the department of agriculture for illustration for two reasons: First, because I assume that a session of the Massachusetts board of agriculture is interested chiefly in teaching agriculture; and, secondly, because the department of agriculture in our institutions of industrial education is the department which suffers most from the lack of definite form in teaching. The same considerations lead me, at this point, to dwell upon the relation between agriculture and other departments of industrial education.

We have always to consider the end to be attained in education. Few parents would be satisfied if their sons were to receive from the institution they attend nothing but the training which would prepare them for the mere drudgery of the occupation they choose. Wood-working and iron-working are included in the mechanical courses not simply that the students may be fitted to be carpenters and machinists; students must master preliminary details for the sake of larger constructive operations. A boy may learn the carpenter's trade by an apprenticeship of three years, and be paid for his work all the time. It would hardly pay him to go to a technical school for four years, meeting the necessary expenses out of his own pocket or out of the treasury of the State or the nation, only to gain such skill as he might be paid for acquiring in less time. A simple trade school, which attempts nothing but to produce skilled artisans, can justify its being only by turning out better workmen than the shop can turn out, or by reducing the time of apprenticeship, or by adding something which an apprentice would not learn. As a matter of fact, the technical schools of the lower grade do not attempt to reduce the term of apprenticeship, requiring, as they commonly do, more than three years' time. Nor do they, as a rule, claim to produce better artisans. A journeyman carpenter will not have spent over the construction of perfect joints so much time as the graduate of a trade school, but he will have gained much more in deftness and quick facility in the use of tools. On the whole, the journeyman carpenter who has served his apprenticeship will be a better carpenter for general work than the school graduate. It is not by giving the same instruction in a shorter time, nor yet in giving better instruction covering the same ground, that a technical school must show its superiority to the school of apprenticeship; but it is in adding to the mere technical training such other instruction as shall better equip the learner for his place among men. Industrial education must be more than learning and teaching trades; more, even, than adding to the development of technical skill a certain ability to apply general principles to the details of a handicraft. It must fit the learner for life—for the life a man must lead among men; and that is something more than the life a carpenter must lead among carpenters, or a machinist among machinists, or a farmer among farmers. This is vital in any consideration of the nature, the purposes, or the methods of industrial education. And until we have found how the technical institution may best fit its students for the large relations which they must sustain, always having in view the special vocation and also the general human obligations, we shall not have solved the problem of industrial education.

This has its immediate bearing upon the relation between agricultural and other departments of industrial education, and in this way: With such material for

teaching as is now available, there is no perspective possible in teaching agriculture. Arranging different courses of study in a general agricultural course is as nearly haphazard a process as anything can be in matters of instruction. Coming fresh from a convention of the so-called agricultural colleges of the country, I am sure of my ground when I say that this is a common fact in the experience of these institutions. Certain text-books may be assigned to the senior year in one of these colleges, with absolutely no reason why they should not have been assigned to the freshman year, or, for that matter, to some year of the preparatory school course. Where there is any perspective it is afforded by the dependence of agriculture upon some more definitely formulated scientific study, as in the cases where an understanding of elementary chemistry is involved. In other words, teaching agriculture gains the perspective of a pedagogical form only when it adopts the form determined by some more precisely formulated science; and where no such other science is involved there is nothing of that orderly sequence in the progress of the instruction which has made the classical education, and in some degree the scientific education, a process commanding respect by the intellectual development it inevitably implies.

I am anxious to make this clear, even at the risk of some repetition. Here are sixty so-called agricultural colleges, or thereabout, each attempting to give as complete instruction in agriculture as is possible, and I suppose everyone of them has to withstand the diverse strains of which I spoke at the outset; on the one hand the inertia of the sentiment which sneers at scientific farming, and on the other hand the strain of the foolish impatience of those who can not understand that until agriculture is reduced to a science it can not be taught as a science. Reduced to a science agriculture certainly has not been. It involves some smattering of scientific knowledge; mainly, as has been indicated, of elementary chemistry. But that farmers are able to speak of potash and phosphoric acid and nitrogen and albuminoids and carbohydrates, hopeful as this is as a promise for the future, is not a demonstration that agriculture itself is even approximating to the exactness of a natural science. It has hardly attempted to use the scientific method of careful and exact observation of facts with reference to large generalizations. How could it be otherwise? What inducement has there been for men to regard their farming in the light of a scientific possibility? The patient, painstaking accuracy, the willingness to wait long for apparently meager results, the disregard of immediate financial return—such qualities as these, all factors of the scientific spirit, have had little opportunity to exercise themselves in the details of tilling the soil. The wisdom of the National Government in establishing experiment stations has begun to afford such an opportunity, but only the veriest beginning can have been made in seven years, and the agriculturists themselves have hardly as yet been willing to unite with these stations in carrying out the work which demands such general cooperation. Until there is a science of agriculture, as there shall be some day, there can not be any satisfactory teaching of agriculture worthy of a college name or a collegiate degree, and the agricultural colleges may face the facts.

Again, if there were a well-defined science of agriculture, it would not in itself constitute a complete industrial education. We might, even now, do what some of the frequent contributors to the agricultural papers seem to demand, and give instruction beginning, say, with the method of cutting and carrying wood for the kitchen fire. Then we might proceed to show how to handle a shovel, a spade, a two-tined fork, and a four-tined one, and so on. But it is hardly probable that boys would go to a college, or whatever the institution might be called, to learn that which they are not too willing to practice at home, where they have at least board and washing and clothes furnished them. As in the case with trade schools, the agricultural college can justify its being, not by giving the training which might have been given on the home farm, nor yet by compressing that same train-

ing into fewer years, but by adding to it something which shall tend to make the student a better farmer, a better man, and a better citizen on his farm. It was profound wisdom which united the mechanic arts with agriculture in the fundamental law establishing the various colleges. Where there are institutions designed to be exclusively agricultural, as in Massachusetts, the same advantage is gained by broadening the course of study so that it shall embrace many branches which are general rather than technical. These studies benefit the agricultural course from the fact that they are not themselves agricultural. They make it possible for the student to gain that personal development which makes for general fitness rather than for special aptitude, and they also ally the more specifically agricultural studies with other studies which have a teaching form already fixed. It would be no benefit to agriculture if we could succeed in forcing an institution to cut out everything in its curriculum which is not directly and immediately technical. No more deadly blow could be struck at the agriculture of the future than would be struck if such a movement should be made universal or even general. Technical education as applied to agriculture is incomplete so far as it is exclusive. It needs, as other branches of technical education do not in the same degree, the help of other studies, technical or general; for, lacking the form of progressive sequence, it lacks the first educational requirement. It will not insure the general development of the pupil, nor will it even fit him for the profession of agriculture.

It may seem as if I had conceded too much in granting, as I have, that technical education as applied to agriculture is confused, immature, and not upon a level with other departments of technical education. But there is some hope in it, for there is nothing in the method of instruction in agriculture to prevent such reconstruction or such gradual improvement as may be suggested by longer experience. The name "agricultural college" is, I suppose, a designation which is likely to be permanent. But the agricultural colleges will never command the respect which other colleges command until they earn it. No decree, no legislation, certainly no declamation, will elevate the institution which is not exalted by its own worth. One of two things, and probably both of them, our agricultural colleges must do if they are not always to be considered, as many people now consider them, institutions where a partial education may be gained, an education distinctly lower, upon the whole, than that of the classical college. Either the agricultural college must produce men who are far on the road to eminence in their chosen specialty, or it must produce men able to maintain their places side by side with the bachelors of arts from other colleges. If the institution aims to produce eminent specialists, and only these, its constituency will be reduced to narrow limits; if it aims to send forth specialists, and at the same time to give as complete general development as any institution can give in the same time, there is no reason why the agricultural college may not have a constituency practically unlimited and win for its name genuine honor. So long as either agricultural or technical education is of greatest interest to us, we ought not to rest until the agricultural college is recognized as the equal of any college in the land.

There may be some points of detail which should not be entirely overlooked, for many questions arise, questions which must be answered somewhere, and which may not unfittingly be asked here. At what point shall the technical education, specifically that pertaining to agriculture, begin? What shall be accepted as sufficient for admission to the technical college, the college of agriculture, for instance? How long shall the course be? What kind of testimonial or degree shall be conferred at the end of the course? These are living questions, and will not soon be finally answered. But some suggestions, with principles back of them, may be made.

Naturally one begins with the last, for the end determines the beginning as truly as the beginning conditions the end. And, in the first place, there should

be no degree representing four years of college residence which can be regarded as of less worth, less honorable, than any other degree representing the same expenditure of time. If at the end of four years spent in one college there is a bachelor's degree conferred, making the bachelor of arts a person of rightful distinction, the agricultural college ought not to confer a degree which may be considered as less honorable as is the degree of bachelor of science. I think I hazard nothing in saying that the letters B. S. attached to a graduate's name do not carry so much weight as the letters B. A., and that is not so very much. This whole matter could be greatly simplified, and would be, if it were a settled principle that the degree of A. B. means that the one receiving it has, after a definite preparation, satisfactorily completed a four years' course of study in an institution of collegiate grade—it does not matter what the course, scientific, technical, or classical. This suggestion is not new, nor is it original with me; but I am convinced that it is correct in principle, and that if it should be applied to the so-called agricultural colleges it would be to the general benefit of industrial education, perhaps of all education.

But this assumes that the institution is of collegiate grade; and the grade of an institution is largely determined by the requirements of admission to it. We can not admit students with poor preparation or with no preparation at all, and with such material maintain a standard of scholarship worthy of the collegiate name. The question of the degree thus involves the question as to the length of the course and the question as to the requirements for admission. As to length of the course, it should not be less than four years, unless a shorter time—three years, for instance—be accepted in other institutions conferring the same degree and having the same requirements for admission.

President Eliot suggests that three years ought to be enough; but this is entirely a question as to the starting point. With a preparation covering a year's work more than is covered commonly by applicants for admission, the college course might be reduced to three years' time; but with preparation under the ordinary standards of Massachusetts, New Hampshire, and the other States of New England, it will take four years to produce the development of mind without which there ought to be no degree conferred, of A. B. or B. S. This does not mean, necessarily, that there must not be shorter courses, requiring less and giving less. But the degree should be the same for equivalent attainment in all institutions. In the department of agriculture it may be possible that a course of two years would appeal to many young men to whom a course of four years would seem like an impossibility. On the other hand, however, is the danger that a course of but two years, with a certificate, of course, not a degree, at the end of it, would tend to lower the standard of the institution, and thus indirectly defraud every graduate who has pursued the full course and thus become entitled to standing as a bachelor of arts. A short course in agriculture is an acknowledgment of the truth of which I have spoken—that in teaching agriculture there is no determined form of progressive sequence. It may also be a confession that the graduate in agriculture is not to be considered equal with the graduate in other departments. So far as this is the meaning of it, the short course is to be unqualifiedly condemned. In any case the question of preliminary requirements is involved. For the candidate for the short course is almost inevitably one who is not prepared for the full course; one, in other words, who belongs in a preparatory school, not in a college. The degree of A. B. should be given after satisfactory completion of the determined number of years' work, but with a definite preparation assumed in every case. What should the preparation be?

This is the practical difficulty in the way of industrial education. And it is to the honor of the Massachusetts Agricultural College that it is seeking to confer the greatest benefit upon its students, and thus to advance industrial education, by raising its standard and increasing the requirements for admission.

I wonder if you understand how much of the heroic there was in such action when President Goodell, together with the faculty and the trustees of that college, consented to raise the standard, at the risk of decreasing the numbers. It was a brave, honorable, manly thing for them to do; and honor will be done them for it as surely as truth is truth, as surely as God gives the final mastery to that which is right and perfect.

Three things ought to be demanded of every candidate for collegiate standing: A thorough preparatory training in mathematics, up to the point now commonly fixed upon by our colleges; a thorough training in English. (I wish I might show some of the English that we get, or, at least, some of the things that are supposed to be English, but are not. How can you give a college training, building up the vast superstructure, with no foundation? We ought to demand of our public schools more and more insistently that they allow no boy, no girl, to go out from their doors without understanding something of the use, the power, and the beauty of the mother tongue. There is danger of giving overmuch attention to scientific training. We are carrying that too far—not teaching too much science, but too many sciences. There is a vast distinction between the two things. Instead of developing in our students the scientific spirit, I think we have tried to cram them with facts.) There should be, I say, a thorough training in English, including a course extending over not less than two years: a touch of scientific teaching, enough to make the student familiar with the scientific spirit and method, and a thorough discipline in some language which has a fixed pedagogical form, preferably Latin. The technical institution may not have Latin in its course; that is not at all to the point. The study of one language which can be progressively taught is of peculiar educational value, even if the student does not expect ever to use the language itself. German would serve almost as well as Latin, French almost as well as German. Greek lacks the incidental practical value of Latin, German, and French. But one language other than the English should be required as a guaranty of the preliminary fitness required by the collegiate standard. There should be at least three years of solid study, grinding drill, until the student has learned something of the formation of language, and much of its use.

I know there are some who have the feeling that we can somehow absorb language by talking a good deal, writing a little, and reading less, and doing all with no particular care and application of the mind to the work. We shall not get a final agreement as to all this in one year or in ten years, but we have our eyes fixed on the future, "and wisdom is justified of her children."

There are matters of detail which must not be dwelt upon here. What I have said, in this hasty and inadequate treatment of the theme of "Industrial education," I have said because there is so large an opportunity for the board of agriculture to further the cause of education, and, most of all, agricultural education. Indeed, to hold official position of any kind in the grand old Commonwealth of Massachusetts is to be under a certain educational compulsion. As representatives of the farmers, you are empowered to act in both directions—upon the resistance of those who would oppose every movement toward a scientific agriculture and a scientific teaching of agriculture, and upon the impatience of those for whom the car of progress moves too slowly. Little by little the great problems of industrial education, problems not fairly appreciated until yesterday, are being worked out. And with the cooperation of the agriculturists themselves, with such unanimity as is possible when institutions and people together seek for the common good of all, the agricultural colleges will go on to definite aims, to wise and comprehensive methods, and to such general development as shall make the name agricultural college a true designation, and also a title of honor.

I thank you, Mr. Chairman and gentlemen, for your courtesy. There are a

thousand things I would be glad to have said. I am not sure there is anything that I have said which I would wish unsaid. The cause of truth is ours. Science and industry are God's handmaids, as they are truths. By them we shall gain the consummation of human life.

V.

CONSERVATISM IN SCIENTIFIC AGRICULTURE.[1]

By Prof. W. H. JORDAN, *Director of the Maine State College Agricultural Experiment Station, Orono, Me.*

The American Agricultural Experiment Station is this year twenty years old; the American College of Agriculture is older. During at least a quarter of a century the teacher and investigator, to a greater or less extent, have been active in this land of ours in their efforts to illuminate the business of the farmer with the beneficent light of science.

Their success has not been startling, though great enough to justify the effort. Inexperience, imperfect knowledge, the immense labor of successful teaching and investigation, prejudice, the inertia that always attends any educational movement, all have conspired to render the attainment of the ultimate object, viz, a more rational practice of agriculture, slow and difficult.

From one point of view, however, a great deal has been accomplished. Generous endowments, both State and national, expended by a large body of trained workers, an enlightened thought, and an improved farm practice testify not only to past achievements but to present effort on a scale that is truly marvelous. * * *

There is at least one complaint the farmers of the United States no longer have the right to utter, which is, that they do not receive full recognition in the exercise of the paternal functions of the national and State governments, or in the growth of the means and methods of public education. Whatever may have been their motives, or the arguments which may have been so successfully used in influencing their action, the representatives of the people have, in their exercise of legislative authority, dealt fairly generously with the industry that feeds us all. Our Government may reasonably claim to have done its part up to the present time in the efforts that are being made to impart special education and to discover needed truth.

The question which must come to the workers in college and station with great force and meaning is: Are we justifying this great use of time and money by what we are accomplishing? Is this tremendous activity that we are putting forth being directed along the right channels? Are those who are teaching and investigating, and who are speaking through the press or from the platform, fully recognizing the real needs of agriculture?

It is not my purpose at this time to attempt a statistical enumeration and discussion of our appliances for education and investigation, or to undertake a detailed criticism of the methods in vogue in the college and experiment station. I do propose, however, to call attention to certain general considerations which I believe should have a controlling influence in the development of class-room and popular instruction, and in the various lines of experiment and investigation.

The subject that is set for discussion is, Conservatism in scientific agriculture, which, perhaps, needs a preliminary definition as indicating the lines of thought which it is proposed to follow.

The conservatism for which I would contend is that which is induced by a recognition of three truths:

First. The proper cultivation of the man is fundamental to the safe development and right use of material resources.

Second. The education, that in agriculture is primarily important, proceeds

[1] Read before the Massachusetts Horticultural Society, January 18, 1896.

from instruction in the relations of matter and energy and in the scientific facts and principles which enter into and environ life, rather than in imparting the technics and manual skill of the farm.

Third. Substantial progress in any art must be based upon an accurate knowledge of underlying truths.

Scientific agriculture is commonly understood to be the practice of agriculture in accordance with the known facts and principles of science, but in our discussion to-day we will understand it to include as well the various organizations and activities that are auxiliary to agriculture as the means of rendering it more rational. Our subject involves, therefore—

(1) The experiment station.
(2) College and school instruction.
(3) The farmers' institute.
(4) The press.
(5) The farmer.

These I understand to be the various agencies through which an organized effort is being made to convey to agricultural practices the benefits of the exact knowledge we call science.

We will first consider, then, scientific investigation as a factor of modern agriculture. This is certainly the logical order, for we must discover truth before we can teach it. What relation does our subject bear to the work of the experiment station?

There exist, I believe, substantial reasons for the following assertion, namely: * * * The greatest obstacle to progress, or even safe procedure, in the art of agriculture now existing is an insufficient knowledge of foundation facts and principles. * * *

It is worthy of note that the only investigations which have outlived a half or even quarter of a century, and which have exerted a profound influence upon agriculture as an art, are those of a severely scientific character—investigations which were carried on in the laboratories of scientists who little dreamed of the far-reaching influence of their labors. The men who have given to the word science the great meaning and dignity which it now has have been lovers of the truth for truth's sake, and I sometimes fear that we as a people are not cultivating the spirit of the true investigator as we should. Is it true that our scientific labors are taking on a merely commercial aspect? Are we asking as the introduction to every piece of scientific work the question, How much will it be worth in dollars and cents?

For some, these questions fortunately can be answered in the negative. It is desirable, however, that the enthusiastic scientific spirit shall more thoroughly pervade our experiment stations, for we sorely need the inevitable outcome of such a spirit. While it is properly a function of the station to show how existing knowledge may be utilized by experiments which serve as object lessons, I believe a more important function at the present stage of knowledge is the discovery of laws and facts fundamental to agricultural methods, leaving the application to farm practice of much of this added knowledge largely with the mass of intelligent farmers, where, after all, it must generally be left. I affirm, then, that the conclusions derived from experiment station work should manifest a conservatism that is induced by severe and searching methods of experiment and investigation.

Our attention will now be directed toward the work of the schools. This is of prime importance, because here are to be trained the men who will be influential in determining the status of agriculture. The standing of any profession or business depends not so much upon the kind of work performed as upon the character and quality of the men engaged in it, provided, of course, that the work is honorable. If the social horizon of the tiller of the soil is narrow, it is not because he digs in mother earth, but is in part because of his inability to reach out to larger

social and intellectual opportunities. While it is not to be expected that all the followers of any calling shall stand in the forefront of social and intellectual life, it is certainly true that if agriculture is to maintain its proper dignity and influence among the world's great industries, politically and socially, it must number among its followers men of the same intellectual ability and wide range of vision that are found in other callings.

Farmers have often complained that lawyers have chiefly legislated for them, but if this is true it is partly because they have not been shown their ability to determine their own political and social status. The conditions that make for supremacy in human society are not nullified or reversed as a favor to the farmer. At the same time that we recognize this fact we must admit another of equal importance, viz, that the interests of agriculture, whether in legislation or in business and social conflicts, are safest in the hands of its own followers who are qualified by education and experience successfully to compete with opposing interests. For these reasons, then, we are anxious that the training of the schools shall render the best possible service to agriculture in the preparation of its leaders.

In order that this shall be accomplished, we must give place to a conservatism which recognizes the value of past experience in the means and methods of imparting a sound education.

When the land-grant colleges were first organized, a popular notion prevailed that an entirely new order of education was to be established—that the matter and manner of the classical college were to be replaced by other subjects and other methods. The young man was to be trained to do rather than to think. The introduction into the curricula of these schools of such subjects as the modern languages, literature, and metaphysics, or even extended instruction in the sciences, was resented by many as foreign to the spirit and purpose of the act which made these new institutions possible. Had such views prevailed, the cause of technical education would have suffered great harm. These extremists forgot, or never knew, that a man's mastery of affairs does not proceed primarily from memorizing a catalogue of material facts or from manual skill, but rather from his capacity for severe and logical thought, and that a farmer's success is due not so much to his ability to plow a straight furrow or his capacity for hard labor as to that analytical power of mind which enables him to discern the right relation of things. To equip a man merely with the technics of the practice of agriculture would fall far short of preparing him for that larger social influence which is essential to leadership or the highest success.

Fortunately, we believe, the four-years courses in agriculture, as now presented by our best institutions, include a fair proportion of general training subjects, combined with such a sequence of chemical, physical, and biological studies that the faithful student not only attains a cultivated intellect, but is given a systematic insight into the world of matter and of life with which he has to deal. Such courses represent the conservative position and are a logical result of the experience of the past.

That they do not impart sound learning and can only meet the demands of an inferior scholarship I do not for an instant admit.

It seems, however, that some who are interested in our land-grant collges place a low estimate upon the educational value of courses in agriculture as they now exist. Certain recent utterances concerning this matter are like a dash of cold water in the face to those who had come to regard the agricultural course in some of our colleges as the peer of any other found there.

The most notable of these utterances is the address delivered last winter before the Massachusetts Board of Agriculture by the able president of the New Hampshire Agricultural College. I propose, in this connection, to criticise some of the main points of this address, because they are based upon what, in my judgment,

is a serious misconception of the essentials of a four-years course in agriculture, and because in so doing I may be able to make clear the views I desire to present.

Certain conclusions reached by President Murkland may be justly summarized as follows:

(1) A "pedagogical form" is a "necessity for teaching any subject," meaning by pedagogical form a logical or progressive series of lessons.

(2) The courses in mathematics and classics have taken on a fixed pedagogical form, which (inferentially) gives them a maximum value as a means of education.

(3) Courses of study related to agriculture and to engineering, especially the former, have suffered from lack of pedagogical form.

(4) Engineering, because so closely allied to mathematics, has found a pedagogical form "ready to its hand in the established form of mathematical teaching," and so is now taught in fairly satisfactory courses of study.

(5) Courses in agriculture are in a present "practically inextricable" "confusion," because "with such material for teaching as is now available there is no perspective possible in teaching agriculture;" * * * "and where no other science is involved there is nothing of that orderly sequence in the progress of instruction which has made the classical education, and to some degree the scientific education, a process commanding respect."

These latter statements are mostly quotations from the address under discussion, and are those to which I shall chiefly confine my attention.

Dr. Murkland's strictures on the courses of agriculture that now exist are based in part on two assumptions:

(1) That agriculture is, or is susceptible of becoming, an independent science, so that in classifying it for teaching purposes we may properly speak of "other sciences."

(2) That the sciences, such as the chemical and biological, which we now recognize as somewhat "precisely formulated," are not a proper and essential part of a course in agriculture, and therefore chemistry, physics, and biology do not, and may not, properly lend their pedagogical form to teaching engineering.

For myself, I can not accept these assumptions. Agriculture is an art, and the act of Congress of 1862 directed us to "teach the sciences related" thereto. To be sure, we may speak of theories of scientific agriculture as a science, but in order to teach these theories as theories are taught in engineering courses we must give instruction not merely in "elementary chemistry" but in advanced chemistry—the chemistry of the plant and the animal, than which none is more profound; and what is true of chemistry is true of other sciences in their relation to the agricultural course. No student can be made properly to understand the facts of horticulture, of plant feeding, or of animal nutrition until he is thoroughly grounded in the botanical, chemical, and physiological facts and principles underlying these subjects; and so, instead of teaching one science, we must teach several.

I do not see how it will ever be possible to so coordinate into a single science, for teaching purposes even, the mutual relations of physics, chemistry, biology, and physiology to the art of agriculture, so that it will not be necessary to teach the individual sciences, unless the course in agriculture is made post-graduate. What, then, does the four-years course in agriculture become? Simply the teaching of a collection of sciences along those lines which lead up to and involve a discussion of their application to the art of agriculture. When, therefore, chemistry, physics, botany, and physiology are taught in this relation, they do not lose their identity, but retain the same logical order which they have when taught as pure sciences, and they lend to the course in agriculture the teaching form which is considered so desirable.

As a matter of fact, four-years courses of agriculture, as now offered by some colleges, at least, are really specialized courses in the sciences, differing from the

ordinary scientific course by pointing out the applications of the sciences to an art. Are such courses a mistake? Are they framed in accordance with false views? I believe not, and this is the reason for my belief: The real and important need of which the farmer is conscious is for a knowledge of conditions and not for methods or for skill in manipulation. When he clearly understands the reasons for that which goes on about him, the right method will appear. The difficulties lie with explanations, not with mechanical processes. And besides, agriculture is not a business involving such delicate and intricate mechanical operations that attendance upon a college would be justified in order to learn them, although the modern dairy, the forcing house, and the fruit garden do require skill. But I venture to assert that no machines or practical methods have yet become available to the agriculturist whose use the clear-brained inmates of our farm homes have failed to master. The spraying of fruit with fungicides and insecticides illustrates how readily the necessary manipulation was acquired when the reasons for these operations became evident. It is the explanation of phenomena, then, which the extended course of study should give in order that the farmer may know how to adapt himself to the varying and complex conditions which he meets in his work.

The same educator whose utterances I have called in question has made other statements in his address which should not pass unnoticed. He declares that "arranging different courses of study in a general agricultural course is as nearly haphazard a process as anything can be in matters of instruction," and that "certain text-books may be assigned to the senior year in one of these colleges with absolutely no reason why they should not have been assigned to the freshman year or, for that matter, to some year of the preparatory school course."

It would have been gratifying if President Murkland had illustrated this statement by specifying particular studies which are so devoid of relation to other subjects that their place in a course of study is in no way indicated, for then his meaning would be more clear. Did he have in mind the subject of tillage, which, unless considered in the light of the underlying principles of chemistry and physics, would be taught in a manner unworthy an extended course of instruction? Did he refer to the teaching of horticulture, which, to be intelligently and systematically done, must be based upon a previously acquired knowledge of botany? Did he mean the subject of plant nutrition, in which the instruction is always halting and unsatisfactory if the student knows no chemistry? Or animal nutrition, to the proper consideration of which must be brought more than a smattering of chemical and physiological information. I believe I am fairly familiar with the list of subjects that could properly be placed in a four-years course in agriculture, and I know of no one which does not seem to have its position as closely indicated as is the case with many mathematical and language subjects, and with some subjects the logical order is almost imperatively fixed.

The statements and conclusions lead to a wide range of questions which we can not discuss here. I will briefly notice one, however. Have the schools of lower grade and the short course in agriculture, such as the "dairy course," no justification?

They are abundantly justified both by what the four-years course has failed, and always will fail, to accomplish, and by the actual results which have followed their introduction. They are reaching young men who otherwise might never have had their thought stimulated to greater activity or their eyes fitted for larger vision. They are not ideal. They are not a full substitute for the four-years course, but I am of the opinion that as a means of carrying to the mass of farmers a higher appreciation of exact knowledge they are likely to constitute the most efficient school effort that we are now attempting. I do most emphatically protest, though, against these briefer courses being regarded as an acknowledgment that the higher

and fuller course lacks form and efficiency. The logic of such reasoning is not clear, and scarcely requires comment.

Passing now from that phase of our subject which relates chiefly to the college professor and the investigator, let us consider the need of conservatism in the interpretation to the farming public of its relation to scientific facts and theories. In this particular field of work, aside from the station bulletins, we have to do chiefly with the institute speaker and the editor.

In order that the farmer may be instructed and helped, and not confused, these two popular teachers should display a conservatism that is born of sound and adequate knowledge.

Institute speakers as we now find them include men of a great variety of experience. To-day we listen to the man of science and to-morrow to the man of practice, both of whom have their peculiar place and value. It is extremely desirable, however, that the one shall not attempt to occupy the province of the other. While there is an occasional scientist who is familiar with the methods of practice, and a few who till the soil that have a fairly wide range of scientific knowledge, the rule is that the one falls far short of expertness in the domain of the other. It is better that the specialist in some line of agricultural practice shall not feel called upon to furnish a scientific explanation of all that he does, and that the speaker who is expert mostly in some departments of science shall not give too much free advice in regard to the details of farm work. Such a regard for the proprieties will tend to the establishment of greater confidence on the part of the public in those who appear in the capacity of teachers.

It is to be feared, moreover, that there is a tendency to gauge the value and efficiency of an institute speaker chiefly by his ability to amuse an audience, rather than by his credentials for sound and accurate knowledge. This is partly due to the fact that many audiences of farmers are better satisfied with amusement than with an address which requires close and earnest attention. It is certain, however, that just as we now confess the disaster due to the incapacity of religious teachers whose only claim to confidence is a sanctified ignorance, so we can be sure that glibness of tongue is not all the qualification which teachers in agriculture should possess.

An error may be as effectually presented from the platform as a truth, but it is of vast importance to the hearer whether it be error or truth. A truth expressed in homely phrase is at least harmless and may be beneficial, but an error attractively uttered is always dangerous and may work injury. It is not an exaggeration to declare that some very grotesque science has been proclaimed at farm institutes by men who were out of their proper spheres of discussion, and who therefore lacked the exact knowledge necessary to accurate and reliable statements of a scientific character. This evil it is within the power of those who officially conduct public agricultural discussions to greatly remedy.

We will now consider somewhat briefly the relation of the press to scientific agriculture. What the agricultural editor most sorely needs is not only a conservative mind, but the ability to discriminate between the true and the false—an ability which does not proceed from a ready and attractive style of writing or from what we in general term the art of journalism, but from a fund of information.

The number of agricultural papers, and papers which have an agricultural page, that are offered to the reading public, is legion. To some of these the farmer is greatly indebted. They are conducted by competent men, who summarize for the readers the best knowledge and thought that are current. Some of them, however, present an aggregation of fact and theory which is without form or comeliness when viewed in the light of truth. * * * There is a great opportunity, though perhaps not yet a great demand, for men especially trained to be editors of agricultural newspapers. These should be men who possess the fundamentals

of science and practice, and while they may not be experts in any one direction, they should be so well acquainted with the sources of knowledge and with the status of men and things that they can sift the chaff from the wheat.

This is not a plea for an aristocracy of knowledge based upon an orthodox training in school or out of school, or upon a required assent to the recognized credo of science or practice. It is not to be expected that even men of acknowledged authority shall all bring their views to the same dead level, but it would be a relief if we could eliminate from public discussion those speakers and writers whose chief claim to a hearing is that they disagree with the accepted verdicts of science and practice, not because they have had the opportunity exhaustively to examine the foundations upon which these conclusions rest, but rather because, after a superficial observation of the surface of things, they are not able to reach the same conclusions. The theories which these pseudo-scientists weave out of the tissues of their own brains, though generally short-lived, may not only mislead, but do great harm by destroying confidence in the science that is worthy of the name.

It may be somewhat superfluous to suggest that there is need for conservatism on the part of the farmer, for he has been repeatedly pointed out as an example of excessive caution in the adoption of new ideas. Certainly he has sometimes assumed an attitude of even extreme reserve toward things scientific, and although the best farm practice furnishes abundant evidence that the discoveries of science have taken a firm hold upon the means and methods of agriculture, yet he is disposed carefully to question any new theories or change of practice that is presented to his attention. Such conservatism is wise. The farmer is receiving a great deal of free advice from a variety of sources, which, as we have tried to show, is not always reliable, and until by inexpensive experiments, or by less expensive observation, he secures reasonable proof of the value of a new method or appliance, he does well to adhere to his old and tried ways.

The peculiar characteristic pertaining to the farmer's conservative habit is that it occasionally suffers unfortunate and costly lapses. The owner of generous acres will often resist the teachings of science and experience, and will sneer at the advice of the ablest men in his own calling, only to grasp at the glib promises of the man he never before saw and of whose trustworthiness he knows absolutely nothing.

We find in farm homes, as we find everywhere, a strange expectancy concerning things new and untried. Humanity has always been hoping that out of the land of magic would come the relief from the burdens of life, or the promise and fulfillment of great rewards from little effort. The fraudulent food and fertilizer, the patent medicine, and the wonderful business opportunity which offers a chance to get something out of nothing, all exist because of this unconfessed faith in the extraordinary value of the unknown. It is this credulity concerning things outside the farmer's ordinary experience that renders it so difficult to defeat the schemes which only defraud. * * *

No one is infallible, no scientist has attained more than a very incomplete knowledge, and mistakes are a common experience, but we confidently assert that the highest realizations in agriculture lie in the conservative yet broadening influence of the scientific effort that is now being exerted in its behalf.

CHAPTER XI.

REQUIREMENTS FOR ADMISSION TO FRESHMAN CLASS IN COLLEGES, UNIVERSITIES, AND SCHOOLS OF TECHNOLOGY.

The requirements for admission to undergraduate courses of institutions for higher education in the United States are almost as varied as the number of such institutions. This diversity of requirements is a great burden to the preparatory schools of the country, as it necessitates the formation of a much larger number of classes than would be the case if uniform entrance requirements were adopted by at least the leading universities and colleges. A movement in this direction has been going forward for some years, and has been taken up by a number of college and other educational associations. Among the bodies throughout the country that are now engaged on this problem are the following:[1] "New England Association of Colleges and Preparatory Schools; Massachusetts Classical and High School Teachers' Association; Commission of Colleges in New England on Admission Examinations; Association of Colleges and Preparatory Schools of the Middle States and Maryland; Schoolmasters' Association of New York and vicinity; University and High School Conference of Colorado State Teachers' Association; Southern College Association; Tennessee Association of Colleges and Schools; High School Section, Ohio State Teachers' Association; College and Normal Section of North Dakota Educational Association; Nebraska Association of Superintendents and Principals; College Section of State Teachers' Association of Nebraska; Department of Colleges and High Schools, South Dakota Educational Association; Committee of Ten of South Dakota Educational Association on College Requirements; Southern Educational Association; Committee appointed by Southern Educational Association to consider relations of Colleges and Secondary Schools; Committee on High School Course, Nevada; Louisiana Association of Latin Teachers; North Central States Association of Colleges and Secondary Schools; Michigan Schoolmasters' Club; Committee of University Presidents to unify requirements; Department of Higher Education of the Montana State Teachers' Association; National Educational Association."

From the foregoing list it will be seen that there seems to be a general movement throughout the country in favor of uniform entrance requirements. Some tangible results have already been reached, especially noteworthy being the fact that the English requirements adopted by the Commission of Colleges in New England on Admission Examinations and the College Association of the Middle States and Maryland are now required for admission by 87 of the institutions of the country, from Maine to Oregon and from Minnesota to Missouri, 26 different States being represented.

The Commission of Colleges in New England on Admission Examinations was formed in 1886 in response to an appeal made by the New England Association of

[1] Education, May, 1897.

Colleges and Preparatory Schools for the purpose of maintaining and promoting uniformity in the requirements for admission. The commission as at present constituted has fifteen members, as follows: Amherst College, Amherst, Mass.; Boston University, Boston, Mass.; Bowdoin College, Brunswick, Me.; Brown University, Providence, R. I.; Colby University, Waterville, Me.; Dartmouth College, Hanover, N. H.; Harvard University, Cambridge, Mass.; Middlebury College, Middlebury, Vt.; Smith College, Northampton, Mass.; Trinity College, Hartford, Conn.; Tufts' College, Massachusetts; Wellesley College, Wellesley, Mass.; Wesleyan University, Middletown Conn.; Williams College, Williamstown, Mass.; Yale University, New Haven, Conn.

The actions and recommendations of the commission are not binding upon the several members thereof, but "full liberty of action is reserved to each faculty on all proposals made by the commission." One of the first matters to receive the attention of the commission was the requirement in English, and nearly all of the annual reports of the commission contain some action taken on this subject, which it is not necessary to repeat here. The admission requirements in English, as agreed upon by representatives of and adopted by the Commission of Colleges in New England on Admission Examinations, the Association of Colleges and Preparatory Schools of the Middle States and Maryland, and the New England Association of Colleges and Preparatory Schools, are as follows:

ENGLISH.

I.—READING AND PRACTICE.

A limited number of books are assigned for reading. The candidate is required to present evidence of a general knowledge of the subject-matter of these books, and to answer simple questions on the lives of their authors. The form of examination will usually be the writing of a paragraph or two on each of several topics to be chosen by the candidate from a considerable number—perhaps ten or fifteen—set before him in the examination paper. The treatment of these topics is designed to test the candidate's power of clear and accurate expression, and calls for only a general knowledge of the substance of the books. In place of a part or the whole of this test the candidate may present an exercise book, properly certified to by his instructor, containing compositions or other written work done in connection with the reading of the books.

The books set for this part of the examination will be:

1897.—Shakespeare's As You Like It; Defoe's History of the Plague in London; Irving's Tales of a Traveler; Hawthorne's Twice Told Tales; Longfellow's Evangeline; George Eliot's Silas Marner.

1898.—Milton's Paradise Lost, Books I and II; Pope's Iliad, Books I and XXII; the Sir Roger de Coverley Papers in The Spectator; Goldsmith's The Vicar of Wakefield; Coleridge's Ancient Mariner; Southey's Life of Nelson; Carlyle's Essay on Burns; Lowell's The Vision of Sir Launfal; Hawthorne's The House of the Seven Gables.

1899.—Dryden's Palamon and Arcite; Pope's Iliad, Books I, VI, XXII and XXIV; the Sir Roger de Coverley Papers in the Spectator; Goldsmith's The Vicar of Wakefield; Coleridge's Ancient Mariner; De Quincey's The Flight of a Tartar Tribe; Cooper's The Last of the Mohicans; Lowell's The Vision of Sir Launfal; Hawthorne's The House of the Seven Gables.

1900.—Dryden's Palamon and Arcite; Pope's Iliad, Books I, VI, XXII, and XXIV; the Sir Roger de Coverley Papers in The Spectator; Goldsmith's The Vicar of Wakefield; Scott's Ivanhoe; De Quincey's The Flight of a Tartar Tribe; Cooper's The Last of the Mohicans; Tennyson's The Princess; Lowell's The Vision of Sir Launfal.

II.—STUDY AND PRACTICE.

A smaller number of books are assigned for more careful study. The examination upon these books covers subject-matter, form, and structure, and also tests the candidate's ability to express his knowledge with clearness and accuracy.

The books set for this part of the examination will be:

1897.—Shakespeare's Merchant of Venice; Burke's Speech on Conciliation with America; Scott's Marmion; Macaulay's Life of Samuel Johnson.

1898.—Shakespeare's Macbeth; Burke's Speech on Conciliation with America; De Quincey's The Flight of a Tartar Tribe; Tennyson's The Princess.

1899.—Shakespeare's Macbeth; Milton's Paradise Lost, Books I and II; Burke's Speech on Conciliation with America; Carlyle's Essay on Burns.

1900.—Shakespeare's Macbeth; Milton's Paradise Lost, Books I and II; Burke's Speech on Conciliation with America; Macaulay's Essays on Milton and Addison.

NOTE.—No candidate will be accepted in English whose work is notably defective in point of spelling, punctuation, idiom, or division into paragraphs.

In addition to the English requirements, the commission has for several years been at work on the requirements in Latin, Greek, and the modern languages. The requirements in Latin and Greek, as approved by the commission in 1895 and transmitted to the several colleges for their adoption, are as follows:[1]

LATIN.

I.—ELEMENTARY.

The elementary examination will be adapted to the proficiency of those who have studied Latin in a systematic course of five lessons a week, extending through at least three school years. It will consist of two parts (which can not be taken separately):

(*a*) The translation at sight of simple Latin prose and verse.

(*b*) A thorough examination on a prescribed portion of Cicero's speeches (about 80 pages, Teubner text), directed to testing the candidate's mastery of the ordinary forms, constructions, and idioms of the language; the test to consist, in part, of writing simple Latin prose involving the use of such words, constructions, and idioms only as occur in the speeches prescribed.

II.—ADVANCED.

The advanced examinations will be adapted to the proficiency of those who have studied Latin in a systematic course of five lessons a week, extending through at least four school years. The two examinations may be taken separately:

(1) The translation at sight of passages of Latin prose and verse, with questions on ordinary forms, constructions, and idioms, and on prosody.

(2) The translation into Latin prose of a passage of connected English narrative. The passage set for translation will be based on some portion of the Latin prose works usually read in preparation for college, and will be limited to the subject-matter of those works.

GREEK.

I.—ELEMENTARY.

The elementary examination will be adapted to the proficiency of those who, in addition to the course defined as suitable preparation for the elementary examination in Latin, have studied Greek in a systematic course of five exercises a week,

[1] Ninth Annual Report of Commission of Colleges in New England on Admission Examinations, pp. 9, 10.

extending through at least two school years. It will consist of two parts (which, however, can not be taken separately):

(*a*) The translation at sight of passages of simple Attic prose.

(*b*) A thorough examination on a prescribed portion of Xenophon (about 30 pages, Teubner text), directed to testing the candidate's mastery of the ordinary forms, constructions, and idioms of the language, the test to consist, in part, of writing simple Attic prose, involving the use of such words, constructions, and idioms only as occur in the portion of Xenophon prescribed.

II.—ADVANCED.

The advanced examinations will be adapted to the proficiency of those who, in addition to the course defined as a suitable preparation for the advanced examinations in Latin, have studied Greek in a systematic course of five exercises a week, extending through at least three school years. The two examinations may be taken separately:

(1) The translation at sight of passages of Attic prose and of Homer, with questions on ordinary forms, constructions, and idoms, and on prosody.

(2) The translation into Attic prose of a passage of connected English narrative. The passage set for translation will be based on some portion of the Greek prose works usually read in preparation for college, and will be limited to the subject-matter of those works.

The portions of Cicero and Xenophon prescribed for the elementary examinations will be changed from time to time, notice of change being given at least two years in advance.

The committee by whom the requirements in Latin and Greek were prepared also reported to the commission proposed courses of study showing how the work required above could be done. The courses as finally approved by the commission at its tenth annual meeting, in April, 1896, are as follows:

PROPOSED PREPARATORY COURSES.

LATIN.

First year, five lessons a week. First and second terms: Introductory lessons. Third term: Easy reading, such as Fables, Viri Romæ, Eutropius, etc. (15 to 25 pages[1]): practice in reading at sight[2] and in writing Latin; systematic study of grammar begun.

Second year, five lessons a week. First term: Easy reading continued (15 to 25 pages); Nepos or Cæsar (15 to 20 pages[3]). Second term: Cæsar (30 to 40 pages[4]). Third term: Ovid's Metamorphoses (750 to 1,000 lines). Practice in reading at sight and in writing Latin, with systematic study of grammar throughout the year.

Third year, five lessons a week. First term: Virgil's Æneid (750 to 1,000 lines[5]); Cicero, in Cat. I and II (23 pages). Practice in reading at sight and in writing Latin. Grammar. Second and third terms: Cicero, in Cat. III and IV (22½ pages). Cæsar (45 to 60 pages) and Ovid (500 to 750 lines), mainly for practice in reading at sight. Thorough grammatical review and practice in writing Latin, both based on study of Cicero, in Cat. II-IV.

---

[1] Teubner pages are the standard.

[2] "Reading at sight" is used in these programmes as a convenient phrase to denote the reading of Latin or Greek with understanding of the sense, independently of or preliminary to the formal rendering into idiomatic English; and by "practice in reading at sight" is meant not merely the translation of unprepared passages in class, but the inculcation of correct methods of reading to be used by the pupil in preparing assigned passages as well.

[3] E. g., B. G. II (17½ pages).

[4] E. g., B. G. (33½ pages) or III and IV (34 pages).

[5] Book I contains 756 lines.

Fourth year, five lessons a week. Cicero (45[1] to 60 pages). Virgil (4,000[2] to 6,000 lines). Practice in reading at sight and in writing Latin. Grammar.

If the advanced examination in Latin composition is not required, the course may be reduced by one lesson a week in the third and fourth years.

GREEK.

First year, five lessons a week. First and second terms: Introductory lessons. Third term: Xenophon's Anabasis (20 to 50 pages). Practice in reading at sight and in writing Greek. Systematic study of grammar begun.

Second year, five lessons a week. Xenophon's Anabasis (continued), either alone or with other Attic prose (85 to 120 pages). Practice in reading at sight. Systematic study of grammar. Thorough grammatical review and practice in writing Greek, both based on study of Book II of the Anabasis.

Third year, five lessons a week. Homer (2,500[3] to 5,000[4] lines). Attic prose, with practice in writing Greek (25 to 40 pages[5]). Grammar. Practice in reading at sight.

If the advanced examination in Greek composition is not required, the course may be reduced by one lesson a week in the last year.

The commission also voted to recommend:

(1) That colleges which prescribe an examination in the translation and subject-matter of specified portions of Homer and Virgil unite in specifying for such examination Iliad, Books I and II, 1–493; Æneid, Books I–V; and that the selection of such additional reading in each author, as may be required by any college, be left to the discretion of the preparatory teacher, the amount only being stated by the college.

(2) That colleges which admit on certificate unite in specifying as required reading Xenophon, Anabasis, I–III; Homer, Iliad, I, II, 1–493; Cæsar, B. G. I–III; Cicero, the speeches against Cataline and on the Manilian Law; Virgil, Æneid, I–V; the selection of such additional reading in each author as may be required by any college being left to the discretion of the preparatory teacher, the amount only being stated by the college.

(3) That colleges which confine their tests in the translation of Greek and Latin authors to translations at sight base their examinations on the assumption that the candidate has read, as part of his preparation, the portions specified in vote (2) above, and that they so announce in their catalogues.

With respect to the admission requirements in modern languages, the commission seems to have some difficulty in arriving at a satisfactory decision. At the tenth annual meeting the following scheme of revised requirements was presented to the commission by the committee to whom the subject had been referred:

GERMAN.

I.—ELEMENTARY.

The elementary examination will be adapted to the proficiency of those who have studied German in a systematic course of five periods a week for one year. It will consist of two parts (which, however, can not be taken separately):

(*a*) The translation at sight of a passage of easy prose containing no rare words.

The passage set for translation will be suited to candidates who have read not less than 150 duodecimo pages of simple German, chiefly narrative prose; this

[1] E. g., pro Archia, de lege Manilia, and pro Marcello (46 pages).

[2] Books II–VI of the Æneid contain 3,999 lines.

[3] E. g., Iliad I–IV (omitting II, 494–end) and VI.

[4] E. g., Iliad I–III (omitting II, 494–end) and VI–VIII.

[5] Making a total of 130 to 190 pages of Attic prose, equivalent to four to six books of the Anabasis.

amount includes sight reading done in class. It is important that all translation be done into clear and idiomatic English.

(*b*) The translation into German of simple English sentences, to test the candidate's familiarity with elementary grammar.

Elementary grammar is understood to include the conjugation of the weak and the more usual strong verbs; the declension of articles, adjectives, pronouns, and such nouns as are readily classified; the commoner prepositions; the simpler uses of modal auxiliaries; the elements of syntax and word order. Proficiency may also be tested by direct questioning.

Practice in pronunciation by reading aloud as much as possible from the texts used in the class is recommended; also the writing of German from dictation.

II.—ADVANCED.

The advanced examination will be adapted to the proficiency of those who have studied German in a systematic course of at least four periods a week for three years. It will consist of two parts (which may be taken separately):

(*a*) The translation at sight of ordinary German.

In preparation for this examination candidates will be expected to have read, in addition to the amount specified under "Elementary (*a*)," at least 600 duodecimo pages of classical and contemporary prose and verse, to be selected from such works as the following: Riehl, Kulturgeschichtliche Novellen; Freytag, Bilder aus der deutschen Vergangenheit, especially Aus dem Mittelalter and Aus dem Jahrhundert des grossen Krieges; Kohlrausch, Das Jahr 1813; Schiller, Der dreissigjährige Krieg, Wilhelm Tell, Maria Stuart, Die Jungfrau von Orleans; Goethe, Hermann und Dorothea, Egmont, Iphigénie; Lessing, Minna von Barnhelm. At least one-half of the amount read should be nineteenth century prose.

(*b*) The translation into German of a passage of easy English prose.

In preparation for this examination candidates will be expected to have acquired a thorough knowledge of accidence, the elements of word formation, and the principal uses of prepositions and conjunctions; the essentials of syntax, especially the uses of modal auxiliaries and the subjunctive and infinitive modes. Proficiency may also be tested by direct questioning.

It is recommended that the candidate acquire the ability to follow a recitation conducted in German and to answer in that language questions asked by the instructor.

FRENCH.

I.—ELEMENTARY.

The elementary examination will be adapted to the proficiency of those who have studied French in a systematic course of five periods a week for one year. It will consist of two parts (which, however, can not be taken separately):

(*a*) The translation at sight of ordinary prose.

The passages set for translation will be suited to candidates who have read not less than 200 duodecimo pages from the works of at least three different authors. This amount includes sight reading done in class. Not more than half the reading should be from works of fiction. It is important that all translation be done into clear and idiomatic English.

(*b*) The translation into French of English sentences, or a short connected passage, to test the candidate's familiarity with elementary grammar.

Elementary grammar is understood to include the conjugation of regular and the more usual irregular verbs, such as aller, tenir, pouvoir, savoir, voir, vouloir, dire, faire, and those belonging to the classes represented by dormir, ouvrir, connaître, conduire, craindre; the forms and positions of the personal pronouns; the uses of other pronouns and of possessive, demonstrative, and interrogative adjectives; the inflection of nouns and adjectives for gender and number, except rare

cases; the commoner uses of the article, and the partitive constructions. Proficiency may also be tested by direct questioning.

Pronunciation should be carefully taught and the pupil should be accustomed to hear and understand the spoken language. The writing of French from dictation is also recommended.

II.—ADVANCED.

The advanced examination will be adapted to the proficiency of those who have studied French in a systematic course of at least four periods a week for three years. It will consist of two parts (which may be taken separately):

(*a*) The translation at sight of standard French.

The passage set for translation will be suited to candidates who have read, in addition to the amount specified under "Elementary (*a*)," not less than 800 duodecimo pages of classical and contemporary prose and verse from the writings of at least five standard authors.

(*b*) The translation into French of English prose.

In preparation for this examination candidates will be expected to have acquired a thorough knowledge of accidence and a familiarity with the essentials of French syntax, especially the uses of modes and tenses, and also with the commoner idiomatic phrases. Proficiency may also be tested by direct questioning.

Careful attention should be paid to pronunciation and to the use of spoken French, that the candidate may at least acquire the ability to follow a recitation conducted in the language and to answer questions asked by the instructor.

The above requirements, while they received the general approval of the commission, do not seem to be entirely satisfactory, as is evidenced by the following extract from the report of the commission:

"After the committee had retired, the commission voted to accept the report and discussed the proposed requirements at length and very carefully, all the members participating in the discussion. It was clear that the problem of devising satisfactory requirements in French and in German was not altogether simple. The lack of parallelism, at certain points, between the requirements in French and those in German was noted; questions were raised as to the relation of the advanced requirements to the elementary in respect of the time allotted to each. It was observed that if a modern language is to become a substitute for Greek, four periods a week for three years in that language are not equivalent to five periods a week for three years in Greek, the amount presupposed in the new requirements in Greek. Finally, the commission unanimously voted:

"That the proposed requirements in German and French be transmitted to the colleges with the general approval of the commission.

"That the executive committee be instructed to invite from the modern language departments of the several colleges their opinions on the following details of the plan:

"1. The amount and character of the reading expected of candidates.

"2. The expediency of specifying authors in the advanced requirements; and that the executive committee be then empowered to take such further action in the premises as they deem expedient."

While other subjects have been called to the attention of the commission and have been discussed, no definite action has been taken thereon.

ASSOCIATION OF COLLEGES AND PREPARATORY SCHOOLS IN THE MIDDLE STATES AND MARYLAND.

The Association of Colleges and Preparatory Schools in the Middle States and Maryland owes its existence largely to the efforts of ex-President Edward H. Magill, of Swarthmore College, which resulted in the formation, in 1887, of the College Association of Pennsylvania. The objects of the association, as stated in the constitution, are "to consider the qualifications for candidates for admission

to the colleges and the methods of admission: the character of the preparatory schools, the courses of study to be pursued in the colleges, including their order, number, etc.; the relative number of required and elective studies in the various classes; the kind and character of degrees conferred; methods of college organization, government, etc.; the relation of the colleges to the State and to the general educational systems of the State and country; and any and all other questions affecting the welfare of the colleges or calculated to secure their proper advancement."

When it was first organized only colleges in Pennsylvania were eligible, but in 1888 the name was changed to the College Association of the Middle States and Maryland, and the constitution was changed so as to make eligible to membership any college in the States included in its name. Again, in 1892, the constitution and by-laws were changed so as to make eligible for membership all universities, colleges, normal and high schools, and other schools which prepare students for college within the bounds of the Middle States and Maryland. In 1896 there were enrolled as members of the association 51 colleges and universities and 86 secondary schools. An examination of the proceedings of the association discloses the fact that while numerous educational subjects have been discussed, no action has been taken on the subject of admission requirements, with the exception of the requirements in English, as noted on a preceding page.

NORTH CENTRAL ASSOCIATION OF COLLEGES AND SECONDARY SCHOOLS.

The North Central Association of Colleges and Secondary Schools was organized at Evanston, Ill., March 29, 1895, for the purpose of establishing "closer relations between the colleges and the secondary schools of the North Central States." The constitution of the association provides that "all decisions of the association bearing upon the policy and the management of higher and of secondary institutions are understood to be advisory in their character." This association has also recommended to its members the adoption of the English requirements, given on pages 458–459, and has now under consideration the subject of entrance requirements in history.

ASSOCIATION OF COLLEGES AND PREPARATORY SCHOOLS OF THE SOUTHERN STATES.

The Association of Colleges and Preparatory Schools of the Southern States was organized at Atlanta, Ga., on November 6, 1895. The constitution as adopted provides that "the object of this association shall be to consider the qualification of candidates for admission to colleges, the methods of admission, the character of the preparatory schools, the course of study to be pursued in the colleges and schools, including their order, number, etc., as well as such other subjects as tend to the promotion of interests common to colleges and preparatory schools."

The by-laws of the association are as follows:

1. No college shall be eligible to membership in this association which furnishes preparatory instruction in any subject as part of its college organization.

2. No college shall be admitted to or retain membership in this association which does not hold written entrance examinations for admission of at least the scope indicated in section 3 below, and publish the same annually, depositing copies of said examination papers with the secretary of this association.

3. The association prescribes the following as minimum requirements[1] for admission to college, the same to be binding on each institution belonging to this association.

In English: Requirements of the Association of Schools and Colleges in the Middle States and Maryland:

In history and geography: United States history and general geography.

[1] The requirements outlined in the by-laws are all to take effect with the fall term of 1897, *except the* requirements in Greek, which become operative with the fall term of 1898.

In mathematics: Arithmetic and algebra through quadratics, or algebra to quadratics and three books of plane geometry.

In Latin: Four books of Cæsar and four orations of Cicero (or their equivalent) with accompanying work in grammar and prose composition.

In Greek: Three books of Xenophon's Anabasis (or equivalent), with accompanying work in grammar and simple prose composition (operative in 1898).

Of the above subjects, examinations in history, geography, and English shall be required of all students admitted to college, provided that students pursuing technical studies in not more than two subjects may be excused from these examinations. Examinations in Latin, Greek, and mathematics, respectively, shall be required of all students expecting to continue these subjects. Certificates covering the above requirements may be accepted from duly accredited preparatory schools in lieu of entrance examinations at the colleges.

4. No college that admits students under 15 years of age shall be eligible to membership in this association.

5. No preparatory school that confers degrees shall be eligible to membership in this association.

The association has at present committees at work to see whether any changes should be made in the minimum requirements for admission to college as given in the by-laws, the said committees to report at the annual meeting in 1897.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION.

At the Buffalo meeting, in August, 1896, the Society for the Promotion of Engineering Education received a report from the committee on entrance requirements of engineering colleges, which had been appointed to investigate that subject. The number of institutions included in the investigation was 110, and the requirements for admission are tabulated in summarized forms, the requirements of individual institutions not being given. The conclusions arrived at by the committee are stated in the report in the following language:

"It is difficult to generalize to the extent of laying down absolute requirements to which all colleges should conform; yet, broadly speaking, there exist to-day two grades of engineering colleges, whose work lies about one year apart. For the first of these the minimum requirements should include the following subjects:

Algebra, advanced.	Two years of foreign language.
Plane and solid geometry.	American history and some additional history.
Physics with laboratory work.	Free-hand drawing.
Chemistry with laboratory work.	
New England requirements in English.	

"For the second grade the minimum requirements should include:

Algebra through quadratics.	English along the line of New England requirements, but less in amount.
Plane geometry.	American history.
Physics with laboratory work.	Free-hand drawing.
One year of foreign language.	

"Below these are colleges, like some of the colleges of agriculture and mechanic arts, that are forced by the necessities of environment or the terms of their foundation to maintain low standards of admission and do in course what other colleges throw into requirements. These should insist on requiring as a minimum:

Arithmetic (complete).	English along the line of New England requirements, but less in amount.
Elementary algebra.	American history.
Plane geometry.	

"Any lower requirements than these bring students into college before they have completed their courses in the lower schools."

NATIONAL EDUCATIONAL ASSOCIATION.

The committee on college entrance requirements appointed by the departments of secondary and higher education of the National Educational Association at the meeting held at Denver in July, 1895, presented a preliminary report at the Buffalo meeting in 1896. The report which was the result of the first year's work of the committee was printed in full in the June, 1896, number of the School Review, and consists of the tabulated requirements in French, German, Greek, history, Latin, mathematics, and science for admission to 60 representative institutions of the country, with remarks upon the same.

Mr. J. Remsen Bishop, of the Walnut Hills High School, Cincinnati, Ohio, who prepared the remarks on requirements in Greek, ascertained the number of institutions requiring specified portions in Greek, and suggested the following as a fair compromise which could be accepted as a requirement in Greek by the colleges of the country:

I. Xenophon and other Greek prose: Xenophon's Anabasis, four books; or Xenophon's Anabasis, one book, and one hundred pages of Goodwin's Reader; or Xenophon's Anabasis, two books, and Xenophon's Hellenica, two books; or Xenophon's Anabasis, three books, and two orations of Lysias.

II. Iliad and Odyssey: Three books of the Iliad, omitting catalogue of ships, or 1,800 lines from Iliad and Odyssey.

III. Sight translation: Practice in sight reading to the extent of one book of Xenophon's Hellenica and one book of either Iliad or Odyssey.

IV. Grammar: The essential portions of the Hadley-Allen Greek Grammar, or of Goodwin's Greek Grammar, or of some other standard grammar.

V. Prosody: The principles of hexameter verse.

VI. Prose composition: Translation of connected English prose, the vocabulary to be limited to that of Xenophon's Anabasis, Book II, and Xenophon's Hellenica, Book II.

The discussions on the other subjects consist largely in giving the number of institutions requiring specific portions of the several subjects, but do not contain suggestions for a uniform requirement.

COLLEGE AND UNIVERSITY COUNCIL OF PENNSYLVANIA.

The report of the State superintendent of public instruction of Pennsylvania for 1896 contains a report on higher education by the College and University Council created by an act of June 26, 1895. On the subject of admission requirements the report says:

"The standard of admission into the freshman class, established by the council as a minimum requirement for all institutions which may hereafter apply for the right to confer liberal or technical degrees, is given in the following report, which was received and adopted at the session of the council held on October 6, 1896.

"The council adopts the following entrance requirements, of which those relating to English, history, and mathematics are prescribed, and of the other language requirements two must be chosen, except that technical schools may require additional preparation in mathematics and physics as a fair equivalent for one language requirement.

"*English.*—Requirements of Commission of New England Colleges, page 458.

"*History.*—The course in history shall include United States history, as indicated below, and any one of the other courses in history appended.

"A. History and Government of the United States, including the settlement and development of the original thirteen colonies, the war of the Revolution, the formation and adoption of the Constitution, the subsequent history of the country.

"B. Greek history: The history of Greece to the death of Alexander, as contained in some standard elementary history of Greece.

"C. Roman history: History of Rome down to the death of Augustus, as contained in some standard elementary history of Rome.

"D. General history, as contained in some standard elementary text-book.

"E. English history, as contained in some standard elementary text-book.

"*Mathematics.*—Arithmetic, including the metric system. Algebra, through quadratic equations, as in standard college text-books. The whole of plane geometry, as in standard college text-books.

"*Latin.*—Latin grammar; Cæsar (first four books of the Gallic war); Cicero, six orations; Virgil, first four books of Æneid with prosody; Latin prose composition, not less than twenty exercises in a standard text-book.

"*Greek.*—Greek grammar; Greek prose composition, not less than twenty exercises in a standard text-book; Xenophon, first four books of the Anabasis; Homer, first three books of the Iliad with prosody (Book II not to include the catalogue of ships), or first three books of the Odyssey.

"*French.*—A thorough knowledge of elementary grammar, including irregular verbs of most frequent occurrence and the use of moods and tenses. Two hundred pages of contemporary prose.

"*German.*—A thorough knowledge of elementary grammar. One hundred pages of German prose."

PRESENT ADMISSION REQUIREMENTS.

The great amount of attention that is being devoted to the subject of admission requirements to college by numerous organizations has led this Office to collect and compile in tabulated form, convenient for comparison, the requirements for admission to the various courses of 475 universities and colleges, with the hope that such compilation may be of some assistance in the study of the subject. The information has been derived exclusively from the annual catalogues[1] of the several institutions, and in a large number of cases is not as definite as might be wished. One of the greatest obstacles in the collection of these data is due to the fact that a large number of the institutions maintain preparatory departments, and many of them do not publish requirements for admission to the freshman class beyond stating that the completion of the preparatory course or a course similar thereto will admit a candidate to the freshman class. The preparatory courses very often are not given in detail, so that it is impossible to tell how much of any individual branch of study is completed during the course, and therefore required for admission to college.

An examination of the table giving the requirements for admission will show a great diversity of requirements, some of them being lamentably low. It will be seen that in some institutions all that is required for admission to the freshman class is a knowledge of what are known as the common-school branches—reading, writing, spelling, arithmetic, geography, and history.

Admission requirements to A. B. course.—Of the 475 institutions included in the tabulated statement, 432 give the requirements for admission to the freshman class of the A. B. course. Of this number 402 require some preparation in Latin, 318 in Greek, and 60 in a modern language. In addition to these there are 25 institutions in which Greek is optional with a modern language, while the number of institutions that require Latin, Greek, and a modern language is 43. From these figures it will be seen that 22 institutions do not require Latin for admission to an A. B. course, 114 require no Greek, and 372 institutions will admit students without any knowledge of modern languages.

Latin.—Considering the Latin requirements in detail, it is found that 374 institutions require some preparation in Cæsar. Of this number 180 require 4 or more books, 27 require 3 books, 19 require 2 books, 8 require Gate to Cæsar, and 140 do

[1] With but few exceptions, the catalogues for the year 1895-96 were used.

not specify the amount demanded. The number of institutions specifying less than 4 books of Cæsar is very small, being but 54, or 12½ per cent of the total number.

The number of institutions requiring Cicero is 288, or 86 less than the number requiring Cæsar. Of the total number requiring Cicero, 117 require 6 or more orations, 23 require 5 orations, 36 require 4 orations, 8 require 3 orations, 9 require 2 orations, 3 require 1 oration, 8 require Cicero's letters, and 84 do not specify the amount required.

Virgil is required by 257 institutions, 136 of which require 6 or more books. Of the remainder, 9 institutions require 5 books, 22 require 4 books, 14 require 3 books, 9 require 2 books, 2 require 1 book, and 65 do not specify the amount required. In addition to these requirements, 13 institutions require the Eclogues, 5 require Georgics, and 4 require Bucolics.

Latin grammar, prose composition, and reading at sight may almost be considered as universal requirements, with the exception of a small number of institutions where the Latin requirements are very meager.

Greek.—The number of institutions requiring Greek for admission to the A. B. course is 318, of which number 286 require some knowledge of the Anabasis, 153 of the Iliad, and 12 of Herodotus. Of the institutions requiring the Anabasis, 98 require 4 or more books, 56 require 3 books, 25 require 2 books, 23 require 1 book, and in 84 cases the amount required is not specified. Of the institutions requiring the Iliad, 99 require 3 books, 21 require 2 books, 1 requires 1 book, and 32 do not give the amount required.

Mathematics.—With respect to the requirements in mathematics, it may be seen that 346 institutions require an examination in arithmetic. The other 86 institutions that do not require an examination undoubtedly suppose that the study of arithmetic has been completed before a candidate presents himself for admittance to college. The requirements in arithmetic usually include a knowledge of the metric system of weights and measures. Algebra is required by 412 institutions, leaving but 20 institutions that admit students to an A. B. course without some knowledge of algebra. Algebra, through quadratics or beyond, is required by 174 institutions; to quadratics, is required by 37, and 201 institutions simply state that algebra is required. With respect to geometry, it is found that 294 institutions require plane geometry; 93, solid geometry, and 8, spherical geometry. Two institutions require an examination in conic sections, and 4 in trigonometry.

History.—The requirements in history seem to be more varied than in any other branch of study. History of the United States is required by 306 institutions, civil government by 129, and State or local history by 9 institutions. General history is required by 127 institutions, history of Greece by 112, and history of Rome by 116. As a rule the institutions requiring the history of Greece also require the history of Rome. History of England is required by 57 institutions, and the history of France and of Germany by but 1.

Admission requirements to B. S. course.—Included in the tabulated statement are the requirements for admission to the B. S. course of 318 institutions. In a number of these institutions the B. S. degree is conferred on students who have completed courses of study in engineering, agriculture, etc.—courses in which, as a rule, no ancient language is required, and naturally none is required for admission thereto. It is, therefore, not surprising that while 93 per cent of the institutions require Latin for admission to the A. B. course, only 55 per cent require Latin for admission to the B. S. course, and only 7 institutions require Greek for admission to such course. The number of institutions requiring a modern language is 123, and a number allow an option between ancient and modern languages. While it is generally conceded that the requirements to the B. S. course are some-

what less than those to the A. B. course, there seems to be a tendency to raise the B. S. requirements until they shall be equal to the A. B. requirements.

In an article on "The new Harvard entrance requirements," by Albert Bushnell Hart, in the October, 1897, number of the Educational Review, he says: "For the Lawrence Scientific School, where the Greek question plays no part, the faculty has already fixed a combination of subjects with large options, and has announced that the entrance requirements in that school will gradually be increased till they reach about the same level as the college (A. B.) requirements." Another noticeable fact in this connection is that Cornell University, Ithaca, N. Y., has abolished the B. S., B. L., and Ph. B. degrees, and will hereafter confer the A. B. degree for the completion of all courses of study excepting purely technical and professional courses, for which technical degrees will be conferred.

The summarized statistics, by States and Territories, of the principal requirements for admission to A. B., B. S., B. L., and Ph. B. courses of study are given in the following tables, while the detailed requirements for each institution are given on the pages immediately following the summaries. The principal object in compiling the requirements was to show, for as many institutions as possible, the amount of preparation required by them of candidates for admission without giving in detail the manner in which the several branches of study should be mastered. To give the method of preparation recommended by the several institutions would require more space than can be allotted to this subject at the present time.

Requirements for admission to A. B. course.

State or Territory.	Institutions having A. B. courses included.	Institutions requiring English requirements of Commission of New England Colleges.	Institutions requiring Latin.	Institutions requiring Greek.	Institutions requiring a modern language.	Institutions requiring plane geometry.	Institutions requiring solid geometry.	Institutions requiring physics.	Institutions requiring history other than United States history.	Institutions requiring Latin, Greek, and a modern language.	Institutions in which Greek is optional with a modern language.
